STATE LIBRARY.

No. 74000

When, from whom, and how this volume was obtained, with the price paid, if any, may be found opposite the above number in the Register of Books, which is always open to inspection.

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

☞The foregoing Regulations will be strictly enforced.☜

MINING AND SCIENTIFIC PRESS.

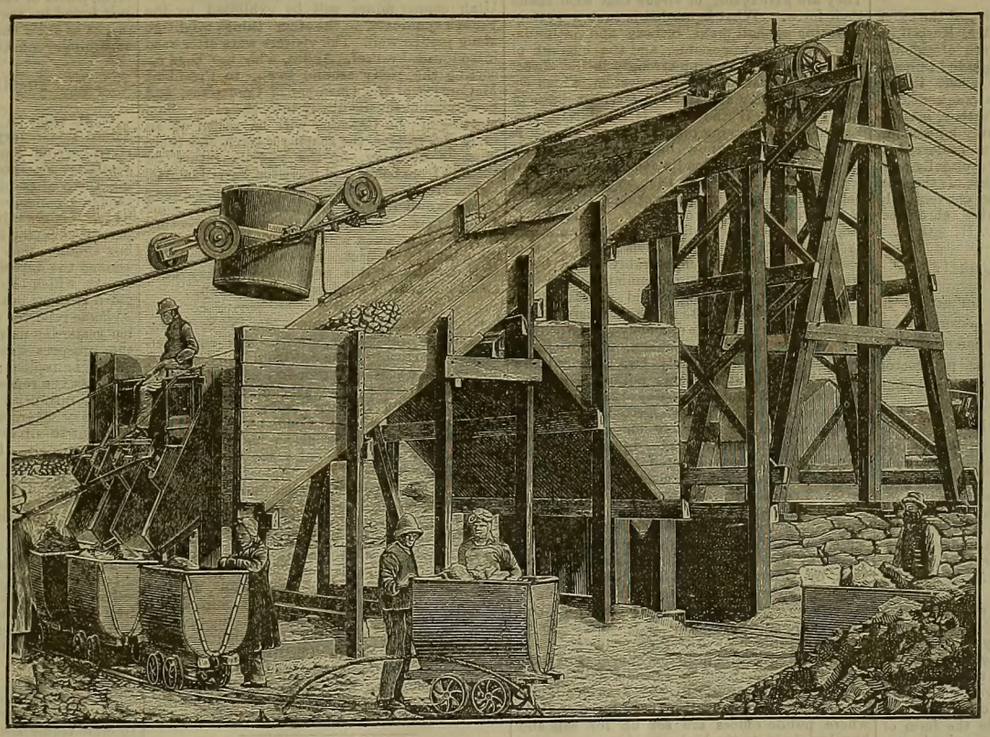
BY DEWEY & CO. Publishers.

SAN FRANCISCO, SATURDAY, JANUARY 5, 1889.

VOLUME LVII Number 1.

The Pig-Iron Market.

From all present obtainable information, there can be no doubt but the consumption of pig iron on this coast this year will be largely in excess of any former year, but notwithstanding this, it is claimed that large consumers are not contracting to any great extent so as to meet their expected requirements. This course is evidently dictated by a spirit of conservatism and also a belief with some that lower values will obtain before the close of 1889. So far as present advices go, there is nothing to warrant, at least the first half of the year, the looking for lower prices in the primary markets, but there is ground for the belief that lower freights will obtain to this coast from ports from whence pig iron can be drawn. If this proves to be correct, then consumers are justified in holding off in anticipating to any large extent their wants. English advices report a strong iron market with the outlook favorable for a continuance well into the last half of the year, so that from that quarter only cheaper freights will induce lower prices being named for prompt shipment. While this is the case from our main source of supply, yet there is an important factor at work at the East that may bring about quite a revolution in prices there and lead to lower values here; this is no more nor less than the growing strength of the iron-mining districts in some of the Southern States. The prejudice entertained against Southern iron, but more particularly against the output of the furnaces in Alabama and Tennessee, is giving way in the Western, Middle and more Northern States, as the production of the first two named States becomes better known. Already are the representatives of the leading furnaces in Alabama and Tennessee successfully working into fields that have been controlled almost, if not entirely, by the Pennsylvania furnaces. This branching out may lead to still stronger competition between the Southern and Northern iron companies, and result in a gradual settling in values. Lower prices there under sharpened competition ought naturally to have an effect on our market. There is an undue degree of secrecy at the East about prices, which justifies the conclusion that some cutting in prices is being made, and Eastern authority on the iron market states that competition is sharper on mill grades, and is also keen on low-grade foundry, but even on these qualities prices have been shaded to a slight degree only. More favorable railroad freight rates for this year will be an important factor to aid in more thoroughly introducing Southern iron, thereby bringing about a still sharper selling competition. An official of one of the largest Southern companies—a company that has ten furnaces that turn out 290,000 tons of pig iron a year—states that his company has already enlarged its contracts for 1889 over those for 1888, through introduction into new territory, 90,000 tons. According to the monthly furnace statement prepared by the *American Manufacturer*, there were on December 1, 1888, in Alabama, Tennessee and the Virginias 29 furnaces with a weekly capacity of 17,000 tons (884,000 tons a year), using coke fuel, and 24 furnaces with 8000 tons (416,000 tons a year) a week, using charcoal. This showing attests the growth of the iron industry of the South and its important bearing on future prices, particularly as it is said the iron can be turned out much cheaper than is the Pennsylvania iron. Not only is the Southern iron making sad inroads into the trade heretofore enjoyed by the Lehigh product, but the American Scotch, a high-grade Southern iron, is steadily supplanting the imported article, the former being superior to the best Scotch, besides being from five to ten per cent cheaper.



ARRANGEMENT OF TERMINAL FOR DOUBLE-CABLE SUSPENSION HOIST FOR MINING OPERATIONS.

PROF. J. E. CLAYTON, the well-known mining engineer, has gone to New Mexico to examine and report on the Carlisle mines, about 12 miles from Silver City, New Mexico, and expects to return in about a month. Prof. Clayton has been for some years in Utah, Montana, Idaho and Oregon. He made the editors of the PRESS a pleasant call as he passed through San Francisco, and we expect to have a fuller opportunity to interview him on his return, especially on some ideas he has concerning gold deposits and formations.

THE prices of coals are being reduced, and it is said that by spring they will be considerably lower.

Aerial Planes in Mining Operations.

Where the character of the ground renders the construction of surface planes a matter of difficulty, the apparatus of aerial planes has peculiar advantages in transporting ore, etc., by wire rope. These planes consist of wire rope extending between points of desired communication. There are several systems in use, all with the same general principles, but varying in detail. The single-rope system is specially adapted to quarry-work, where the loading-point is continually shifting. In this system, the incline consists of a single wire rope, one end of which is made fast at the bottom of the quarry, while the other end passes through the head of a derrick or mast to an anchorage on the bank beyond. The hauling rope being fastened to one side of the carriage, passes downward around the hoisting-blocks and up again to the carriage, from whence it continues on to the hoisting engine.

Where the grades are excessively steep, and a large output is required, the double-rope system is very serviceable. The governing principles are similar to those of surface inclines, the two ropes serving instead of the surface track. This system is applied at the South African diamond mines. We give an engraving on this page of the arrangement of terminal for a double-cable suspension hoist, which we take from a paper on "Wire-Rope Haulage and Its Application to Mining," read before the American Institute of Mining Engineers by Frank C. Roberts of Philadelphia.

THREE veins of coal have been discovered in the Fresno county hills.

A New Concentrator.

John A. Jones of Tuscarora, Nev., has patented through the MINING AND SCIENTIFIC PRESS Patent Agency a simple and peculiar form of concentrator for sulphurets, fine placer gold, tailings, etc. It consists of a semi-cylindrical case or bottom looking like a large water pipe, cut in two lengthwise with the sides or edges turned inwardly to prevent the escape of the contents when the cylinder is rocked from side to side. The ends of the cylinder are in the form of circular disks. The apparatus is placed on a table-like base or support on any surface on which it may be rocked back and forth. The support, near the receiving end, is sufficiently higher than the one near the discharge end to retain the apparatus in an inclined position, so the material will gradually pass through. Pins attached to the bottom of the cylinder enter holes in the transverse supports, moving loosely in the holes so they will not impede the rocking motion, but will keep the cylinder in place.

The material to be concentrated is delivered into the circular opening of the disk at the upper end from a sluice, so it will fall in without producing any current. The rocking motion will break up and interrupt any current which may be produced by the inclination of the apparatus and will separate the lighter sand or material from that which is heavier, so that the latter will settle to the bottom and sides, being prevented from passing over the sides by their hight or by the inwardly-turned flanges.

Silvered copper plates are made in sections and fitted into the trough or cylinder when the machine is used for catching quicksilver or gold. The disk in the lower end has an opening made in it which is formed of two segments of circles of large diameter placed together so as to form a lenticular slit or opening having its shortest diameter in a vertical line and its longest in a horizontal line. Through this opening the lighter material will gradually escape, leaving the heavier in the apparatus. The device is simple and inexpensive.

FREEMAN'S DRY PROCESS.—Mr. James B. Freeman, the inventor of a "dry-process separator" for gold ores, whose address several people have written for, is a resident of Los Angeles. We shall shortly give an illustrated description of the machine.

SOME gold ore is said to have been found among the Buckland Hills, in Franklin county Mass., and there is quite a local excitement.

THE annual election of the California Academy of Sciences occurs on Monday next. There are two tickets in the field.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Lixiviation of Silver Ores With Hyposulphite Solutions.

CONCLUSION.

EDITORS PRESS:—Concluding for the present my remarks on the above subject, I wish to say that the suggestion with which my second article closes was not intended to imply, as some have supposed, any doubt of the utility of Mr. Russell's process in those cases in which the "old process" fails of extracting a high percentage of the value of the ore. By the "old process" I do not mean, as some writers on the Russell process do, the Patera process with sodium polysulphide containing caustic soda, nor do I refer to cases of manifestly and needlessly imperfect roasting, like some of those with which comparison has been made in favor of the Russell process.

I believe it is admitted, as it must be true, that where the conditions admit of such roasting as will convert nearly all of the silver into chloride, sulphate, arsenate or antimonate, the extra solution can do but little good. I have shown that in the Kiss process, which is the real "old process" of this coast, the leaching solution is not likely to become caustic unless in the case of a calcareous ore containing caustic lime. The Russell process certainly costs more than the other, and my intention was simply to call attention to the facts and to hint that the application of that process should not be indiscriminating. At the same time Mr. Russell's discovery of the action of the cuprous hypo is interesting, and that it is also useful, we have, I think, sufficient evidence after making all proper allowance for bias, and for Mr. Russell's superior skill in roasting as shown by his recent results, which were certainly not wholly due to the special merits of his leaching process.

As to the apparent compatibility of the extra solution with the Kiss process, Mr. Russell informs me that, in general, the use of calcium sulphide instead of sodium sulphide has made no difference in his results, but where it has made a difference that difference was considerable. I think this should be further investigated, because there will probably be cases in which the Kiss process will be preferred if equal results can be obtained, especially as it has been shown that the separation of the lead from the calcium hypo may be conveniently effected by means of a soluble chromate. (Patent applied for.) C. H. AARON.

Honey-Comb Rusty Quartz.

EDITORS PRESS:—In reading an article in "Le Conte's" work on Geology I came across an answer to a conundrum which had often puzzled me, and, as some other young prospector may want to know the same, I will call your attention to it.

In an article on fissure veins "Le Conte" explains why we find frequently in surface quartz free gold, but upon prospecting the vein to a depth of 50 to 100 feet we lose the free gold but find sulphate of iron or pyrites instead.

His reasoning is something like this: That when such a vein (fissure vein) is exposed to meteoric influences the pyrites are oxidized partly as soluble sulphate and carried away and partly as *insoluble reddish peroxide*, which remains.

The quartz is therefore left in a honey-comb condition by the removal of the pyrites, more commonly stained a rusty color by the peroxide.

Among the cells of the rusty honey-comb quartz the gold may be found in minute particles. Hence, in some quartz veins the gold may be found free along the "croppings" to from 30 to 60 feet; below that, in the form of sulphate of iron. This seems a reasonable explanation and is sustained by the fact of this honey-comb rusty quartz being so sought by the old prospector. CHAS. POST.

MELBOURNE EXHIBITION.—A letter concerning the Melbourne Exhibition says: The California mining machinery in the American annex has suffered for the want of proper steam-power. When that boiler was first put in, I told John Blythe, superintendent of machinery for the entire building, that it was insufficient to run the machinery of either Parke & Lacy, Ward & Co., H. P. Gregory & Co., or the Risdon Iron Works. All the satisfaction I could get was the stolid answer that there would be power enough, but there has not been nor will not be. Hence I deem it but an honest statement to say that American exhibitors of mining machinery have had no fair chance. Perhaps the Melbourne foundries are at the bottom of it.

THREE men have been arrested at Nevada City for selling bogus nuggets and quartz specimens to Chinese merchants. The nuggets were made of brass and were gold plated, so as to resist acid. Small particles of quartz were imbedded in them. The quartz specimens have brass filings sprinkled in them and fastened in the crevices. The imitations are very good and would easily deceive any one but an expert.

King Boodle.

The New York *World* has recently taken the pains to collect and publish a large and startling amount of proof that money was lavishly used for the purpose of corrupting voters at the late national election in many States. The investigation was no one-sided partisan affair. It shows conclusively that a corruption fund was prepared and employed by both sides; that the evil is not a Democratic nor a Republican evil, but a national evil; that human nature is all off the same piece, and the average politician of all parties under the same pressure of circumstances will do pretty much the same thing; that party leaders cannot cast stones at each other, but all are dominated by the greed of loot and plunder. The boodle dynasty is everywhere. Right here in this city there is a vast amount of discontent and muttering at the way the polls are conducted. Our best citizens, business men who are largely interested in the fair fame and prosperity of the city, are awakening up to the fact that our municipal government has largely fallen into the hands of scoundrels and thieves; that the spoliation of the ballot-box has become an art, and the frustration of the will of the people, the most sacred prerogative they possess, has become a trade; that tricksters, political bandits, and, in short, the criminal classes have got the possession of the political helm.

This evil has become so extensive that patriotic men of all parties are aroused to the necessity of rescuing the ballot-box from the control of King Boodle. Whether the Republicans buy votes in Indiana or the Democrats buy votes in New York, or the bosses in this or other cities combine to bribe and intimidate and tamper with the elective franchise, the crime against the people and good government is the same.

And now what is the remedy? Independent movements, citizens' tickets and the like have all been tried with merely a temporary success. They are paroxysms of virtue that soon spend their force. What is needed is such a system of voting as shall make bribery and intimidation absolutely impossible, and the current of public opinion is tending strongly in the direction of the Australian ballot system, which we quite elaborately explained in a recent issue of the PRESS. If the voter is absolutely prevented from showing his ballot and no one is able to certainly know how he voted, it is apparent that King Boodle can have no guarantee that the goods he has bought will be delivered. The system is perhaps susceptible of receiving many improvements. In England, where corruption was formerly more rampant at elections than it has ever been in this country, the evil was measurably cured by a law compelling campaign committees to file accounts of their expenses, and unseating by the courts any candidate in whose interest any illegitimate expenditure of money can be proved to have been made. In Canada, in addition to the Australian method, only two hundred are allowed to vote at any one polling-place, and we were told the other day that this plan works well. It has been suggested that registration should imperatively close sixty days before election, and that the precinct election officers should be appointed by the Superior Judge from our leading citizens, giving each party an equal representation.

Our Legislature soon to assemble should study the law passed in Massachusetts last year, which many think is far better than the bill passed by the New York Legislature and vetoed by Governor Hill. The Kentucky Act passed as an experiment and made applicable to the city of Louisville may be profitably studied by our municipal officials. It is claimed to be a great improvement in city government.

At all events, it is quite certain that in some way or other the American people will sternly demand that King Boodle be dethroned and that their elections shall not be mere auctions where public offices are set up for sale and knocked down to the highest bidder.

SALT DEPOSIT LANDS.—The Secretary of the Interior has rendered a decision rejecting the application of Elias Crane, E. W. Crane and F. Oliver, for a patent under the Mineral Act of May 10, 1872, for the Salt Bluff Placer mine, located in the Salt Lake, Utah, land district. The secretary holds that no authority exists for the disposal of saline lands or salt springs belonging to the United States except under the provisions of the Act of Jan. 12, 1877, which does not apply to the Territory of Utah, and that the policy of the Government is and has been from the earliest date to reserve all saline lands, and to dispose of them only by specific Acts of Congress. This is said to be the first instance in which an application has been made to enter Government salt deposit lands to be worked as placers.

NEWS comes from Unionville, Nev., that R. S. Fielding and James Harvey are working placer mines in Spring Valley with good success. The great drawback is scarcity of water, and the gravel has to be worked with rockers.

THE total assessments levied by the Comstock mining companies during the current year aggregate $2,254,700. The bullion product of the mines during the same period will exceed $5,000,000.

The Beaver Copper Mines.

Comte d'Adhemar and MM. Sallandrouze and Sebillot leave to-day for Frisco, says the Salt Lake *Tribune*, where they will give the Comet and Cactus copper mines a careful examination upon which they will make a report to the French syndicate which has sent them over here. As this syndicate is said to represent 30,000,000 francs, the chances of a good slice of this finding its way into Utah bodes great good to this Territory. A recent number of *Le Figaro* says of the first two parties: "The Normanay sailed Saturday from Havre for New York, bearing on board the Comte d'Adhemar, president of the society of the Comet mines, accompanied by M. Sallandrouze, delegated by the Banque d'Escompte to take charge of the Cactus mines acquired by this society. These gentlemen will assist, at the same time, in the inauguration of the Comet smelter plant at Frisco, Utah, erected for the treatment of the minerals of the Comet, Cactus, and Foggi mines. Bon voyage and prompt return to our esteemed compatriots." In conversation yesterday with a *Tribune* reporter, the Count said he was agreeably surprised and highly pleased with Utah. Over in Paris the idea seems to prevail that the Territory is peopled by savages, and when the distinguished visitors reached Salt Lake they were astonished to find the savages using telephones and electric lights, and the makings here of a great city. They believe now that Zion will arise and shine ere long, and that a great future is in store for her as well as for the Territory. Count Adhemar, a man of wealth and polish, spoke of the coming Paris Exposition, and urged the necessity of Utah's being represented there with a full line of samples and specimens covering every resource and industry within her borders; and said he would gladly take charge of these samples and specimens free of cost to the Territory, and exhibit them in the Exposition, the Chamber of Commerce or other parties interested paying only transportation and other necessary expenses. Specimens from the Utah copper mines will be exhibited by the French syndicate, so the other things might go along just as well. The visitors were afterward introduced by Prof. Andre, who has been escorting the party around town, to President McCornick of the Chamber of Commerce, and he entered enthusiastically into the plan. So a meeting of the Chamber will be called at an early day to give the scheme a start, and there must be no delay, for the visitors return on the 23d from below and leave for Paris Jan. 1st.

The erection of the smelter in Copper gulch, Grampian district, is progressing rapidly, some 45 men being employed on it. After inspecting this, the gentlemen will visit the Copper King mine in Star district. Seven men are now at work developing this property, and they have about 200 tons of good ore on the dump.

OIL INTERESTS IN KERN.—Mr. W. S. Thorston, the oil and gas expert who was employed by local parties to come out from Toledo, Ohio, and examine some oil property in this county, arrived in town a little over a week ago. In company with J. S. Hambleton, superintendent of the Union Land & Oil Company's works, and Alphonse Weill of this place, he went out to the Temblor mountain and made an examination of the oil and gas indications in that section. His entire report has not been made public yet, but it is known that he said there was oil there in paying quantities. He does not believe flowing wells could be obtained, owing largely to the thickness of the oil and its consequent disinclination to flow. He thought it was hardly necessary to bore wells, as the natural springs now flowing would furnish a supply for some time. He also said if the present owners would not place too high a figure on the property he thought no difficulty would be experienced in getting capitalists to take hold of it and develop it. This, it is generally thought, would mean a pipe line leading from the oil district to the railroad at this point.—*Kern Echo.*

IRVING M. SCOTT of the Union Iron Works has gone to Washington to meet Secretary Whitney and perfect arrangements for the trial trip of the new cruiser Charleston, which is nearing completion. The Secretary of the Navy has invited proposals for the construction of a coast-defense vessel of 4000 tons, to be completed within three years. The armament will be furnished by the Government and the contractors can bid on the Secretary's plans or on plans of their own preparation. Mr. Scott will bid for the construction of the war-ship, and, probably, only two or three other bids will be received. The proposals for this work will be opened on the 26th of next February.

ON THE DECLINE.—The once prosperous little town of Hailey, Idaho, seems to be steadily on the decline in every branch of business, and its population is rapidly falling off. The postmaster of the town has resigned his position, and up to this time no one can be found to accept the position. The newspapers there show a falling off in business, and recently the *News-Miner* was compelled to decrease in size from a six to a five column sheet. This condition of things is to be deplored and it is hoped a change for the better will occur soon, and we believe it will, for the mineral resources of the Wood River country will yet come to the front and bring back prosperity to its people.

Growths of the Dark.

At Lernhart's drug store is to be seen a fungus of unique and beautiful form, that was brought up from the 1300 level of the Yellow Jacket mine. It was found growing on a timber in an old drift and is of a trumpet shape. The whole specimen—stalk and head—is nearly a foot in length. It is a species of mushroom, but of a distorted form, owing, no doubt, to the darkness of the place in which it was produced. An ordinary mushroom has the gills on the underside and is smooth on top.

This specimen has a crook in the stalk as though it had curved toward a place where there was some light—perhaps a dim light at the shaft—and the gills appear to have made an effort to reach in the same direction. Thus the outer rim of what would be the top of a common mushroom has been pushed forward so much beyond the central part as to form a cavity in the shape of the interior of a teacup, and the gills are seen (well defined) on what would be the outside of the teacup. A better idea of this phenomenon of fungus growth will perhaps be obtained if we say that it has been reversed from its natural position, exactly after the manner of an umbrella turned inside out by the wind. This reversal appears to have been due to an effort made by the "hymenium" or gilled part to reach forward toward a current of air or some faint light, thus overcoming the top or smooth part of the pileus, and so far reversing its form as to give it the shape of the mouth of a bill.

Many persons look upon the fungi found upon the timbers of old drifts as growths produced spontaneously by dampness and decay. In this we are sure they greatly err. Undoubtedly the spawn of fungi of various kinds is deposited on the timbers before they are taken down into the lower levels and remain on them until moisture and decay unite to produce conditions proper to their vegetation. In their efforts to attain to the other requisites of growth, air and light, they reach out till they take on snake-like and various other forms, yet at their terminal points will be found, in a distorted form, traces of their species. The queer fungus just found in the Yellow Jacket has such earmarks as show that it was born of the spawn of an ordinary mushroom.—*Virginia Enterprise.*

To Make Utah Iron.

G. H. Giles of Oshkosh, Wisconsin, and Dr. James T. Gregory of Ashland, Wisconsin, arrived here on Tuesday and left for Iron county yesterday afternoon for the purpose of examining the coal and iron deposits there. The gentlemen are members of a big Eastern syndicate which was organized some time ago for the purpose of engaging in iron mining in Utah, and last summer they sent out an expert who examined the deposits and made a very glowing report, which Messrs. Giles and Gregory decided to come out and verify for themselves. A *Tribune* reporter met Dr. Gregory at the Cullen yesterday morning, and when asked what the prospect was for the development of the mines, he replied: "Well, it all depends upon whether the reports made to us are true or not. If the enterprise is taken hold of it will be necessary to erect a very expensive plant, and we want to investigate before putting a lot of money into it. I will say, however, that if the property meets with our expectations, it will not be long before active operations are commenced."

"In that case, how much money will you expend?"

"It is very difficult to estimate that; we might start in with $200,000 or $300,000, but that would only be the beginning."

The gentlemen will spend about a week in Iron county, and then return home. They are both already interested in mining in Wisconsin. —*Salt Lake Tribune.*

PUMPING MACHINERY for the new placer mines on the Colorado river is being unloaded at Green river for cartage 115 miles, and two 16 mule teams are now loading up. Colonel N. R. Hite of Wichita, Kansas, is the prime mover in this venture, and the gold samples recently sent over to Green river make it look decidedly promising. The pump will throw 2000 gallons of water per minute from the Colorado river into two sluiceways.

THE Southern Pacific Co. is cutting down expenses. General Superintendent Fillmore told a reporter that the necessity of cutting down the company's operating cost was caused by the slackness of shipments all over the coast during this winter. About 1000 employes, including some assistant agents, have been discharged from various stations in Arizona, Nevada and this State.

JOHN FARISH is down from Park City, feeling happy over the success of the Woodside. Himself and partners are ahead about $50,000 on ore shipped, after paying all expenses and giving E P. Ferry 20 per cent royalty. They are shipping 50 or 60 tons per day, such as nets about $65 per ton.—*Salt Lake Tribune.*

THE Belmont *Courier* understands that several rich strikes have been made in the mines at Ophir and Summit canyons, Nye county, Nev. Some of the ore assays high. Also, that it is the intention of the Chicago M. & R. Co. to resume operations in their mine at Ophir canyon early next spring.

Imported Iron Ore.

One of the most prominent firms engaged in mining iron ore in the Lake Superior region has lately purchased a valuable ore bed on the south side of the island of Cuba. Pennsylvania capitalists have for several years past been mining iron ore in Cuba and shipping it to the United States for their own use in the Bethlehem and other iron works in Eastern Pennsylvania. Last year some 20,000 tons of ore were thus imported, and paid the duty of 75 cents per ton.

The purchase made recently comprises about 500 acres and a most valuable deposit of ore. It is located near the shore of the island, so that the ore may be shipped without serious cost. The quality of the ore is that which is most needed in this country for Bessemer steel. It contains less than 59-1000 per cent of phosphorus, so that it might be mixed with advantage with the ores of Lake Champlain and other American ores, which contain an undue proportion of phosphorus.

The quantity of ore in sight on the property is stated at not less than 1,000,000 tons. It is fortunate that the ore from this locality will not be controlled by any one of our Eastern iron manufacturers. It will be brought here for sale, and will, to some extent, take the place of Spanish or Lake Superior ores, which have been used for similar purposes.

There is one fact suggested by this enterprise, viz., that 75 cents per ton is not adequate protection against the importation of foreign ore, mined under favorable conditions as to labor and shipment.—*Tariff League Bulletin.*

THE RYAN SMELTING WORKS.—Active preparations are being made for the erection of the Ryan Smelting Works at Tacoma. The building will be 210 feet long and will contain four Root blowers, two furnaces 33x48, two reverberatory furnaces, a Corliss engine 48x20, two boilers 60x10. The main stack will be 90 feet high, 28 feet square at the base, the walls of which will be 5½ feet thick at the base and 18 inches at the top. The works will have a capacity of 200 tons per day, and will be equipped to handle all kinds of ore. The machinery has all been ordered from Fraser & Chalmers, Chicago, but it will not be shipped until the company can lay it down on the grounds and are ready to place it in position. The reduction works will, when in operation, employ from 200 to 300 men. The lead flux used will be procured from the Hunter mine at Mullan, in which Messrs. Ryan, Louderback and others of the reduction works company are interested. They want the smelter completed just as quickly as possible, and they expect to have it so by February, or, at the latest, March next. Sixty men are at work now engaged in completing the excavation, the cribbing and the foundation for the great stack.

OUT of a yield of $250,000 taken from the Delhi mine, Nevada county, in a stated period, $210,000 was paid in dividends. A vein of rich quartz has been struck in the lowest level, but its width has not yet been determined. The quartz crushed is rich and the sulphurets yield $200 a ton, $10,000 worth being saved last month.

The "San Francisco" of Nevada.

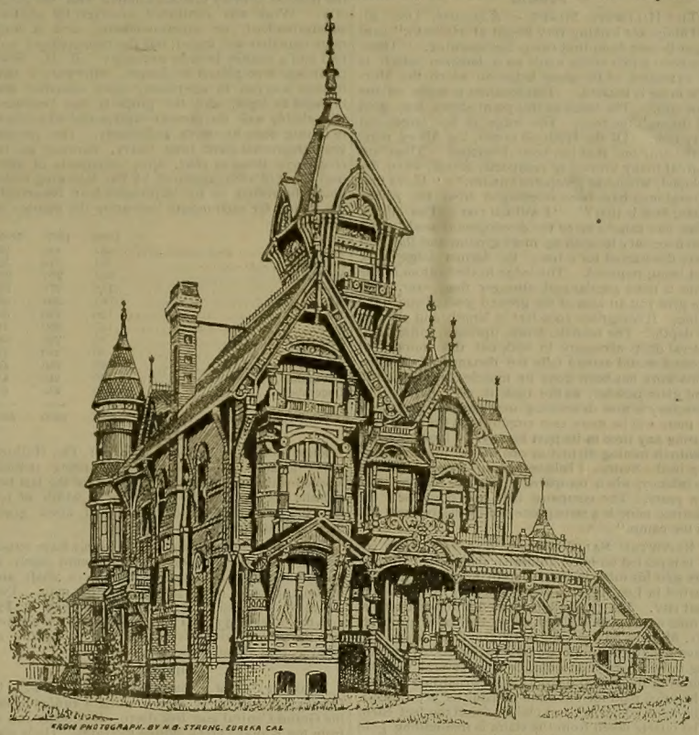
Virginia City is the metropolis of the State. Her population is almost as cosmopolitan as that of the Bay City. The town is situated on the eastern slope of Mt. Davidson. The altitude of B street, the principal thoroughfare, is 6319 feet.

According to the Surveyor-General's report, in 1857 Joe Kirby and others commenced placer mining in Six-Mile canyon, about half a mile below where the Ophir Works now stand. On Feb. 22, 1858, the first quartz claim was located in the Virginia Mining district, by James Finney, generally known as "Old Virginia," from whom the city of Virginia and the croppings took their name.

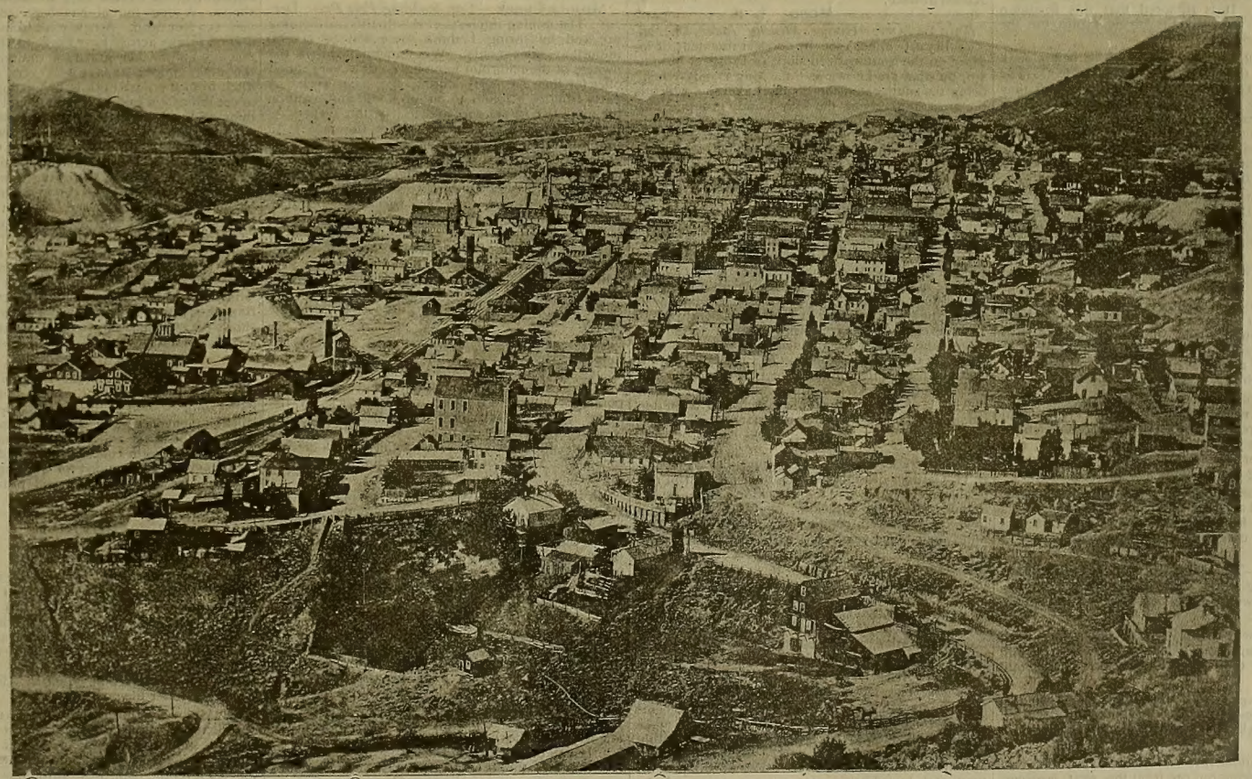
In June, 1859, Peter O'Reilly and Patrick McLaughlin discovered a rich vein of sulphuret of silver. The discovery being on the ground claimed by Kirby and others, Comstock was employed to purchase their claim, whereby Comstock's name was given to the great lode.

The population of Virginia City in 1861 was 2704, but in the palmiest days it was estimated at 20,000. To-day it is about 10,000. There has always been, and is still, considerable speculation as to how long this body of ore will hold out at the rate it is being extracted. Five or more years ago the opinion was so prevalent the camp was about exhausted, that real estate was of very little value. Subsequent explorations exploded the fallacy.

The 65 mining companies on the Comstock lode represented on the Stock and Exchange list at San Francisco have paid dividends, since their organization, amounting to over $44,000,000, after deducting all assessments ever made.



RESIDENCE OF MR. CARSON, EUREKA, CAL.



BIRDS-EYE VIEW OF VIRGINIA CITY, NEVADA.

There are many reasons which amply justify the conclusion that this lode is good for many years to come.

COMSTOCK BULLION.—The Virginia *Chronicle* has made the following estimate of the bullion yield of the Comstock mines during the month of December: Con. California and Virginia, $340,000; Hale and Norcross, $160,000; Confidence and Challenge, $150,000; Chollar and Potosi, $25,000; Alta, $25,000; Savage, $25,000; Occidental, $10,000; Yellow Jacket, $10,000; Overman, $7500.

Redwood Houses.

Nearly all of the wooden houses on this coast are made of California redwood, but it has only been within the past few years that it has been used for interior finish and decoration. Now, however, that painted wood is unfashionable for interiors, the native woods are being utilized, and the redwood largely. The roots and stumps have a curly grain, which is very beautiful when polished. We give an illustration on this page of the handsome residence of Mr. Carson, of the firm of Dolbeer & Carson, in Eureka, Humboldt county, built mainly of redwood.

Its exterior appearance is grand and attractive, as may be gleaned from the illustration. The interior is elegant in its appointments and finish. All the different forms of redwood—straight-grained, curly and variegated—besides foreign hardwoods, are used in the interior finish and decorating. Some idea of its elegance may be formed when it is known that all the lumber was finished and millwork done at Mr. Carson's mill, and yet the cost was $30,000. The stable in the rear and standing at one side is of the same architecture as the residence. Messrs. Newsome Bros. of San Francisco were the architects, and it may be well called a masterpiece of the builders' art. One of the most attractive features is the use of different woods, hard and soft, natural and stained, in the different suites of apartments, giving a rich, elegant and pleasing variety, and making this palatial residence one of the finest that can be seen anywhere, surrounded as it is by the spacious and well-appointed grounds, and occupying a commanding site.

PLANCHAS DE PLATA.—The sale of the famous Planchas de Plata group of mines, 18 miles southwest of Nogales, to a syndicate of New Orleans capitalists, has been completed and the money paid over. The property consists of five mines and ten stamp-mills. The price has not been definitely stated, and it is said to be $150,000 spot cash. The property is just over the line in Sonora, and has been worked for 15 years in an indifferent manner by Mexicans. The new company will start up the mill at once and also begin the erection of another large mill immediately.

THE Centennial Eureka, Tintic District, says the Salt Lake *Tribune*, sent in a ten-ton lot of ore from a rich pocket lately tapped, and had it sampled this week. It went 557 ounces silver, ½ ounce gold and 16 per cent lead. This late strike, together with the large bodies of lower grades being opened up, makes the Centennial loom up in the eyes of mining men.

THE oil country near Green river, Utah, is to be developed by the parties already interested in it, as they begin to feel they can handle the oil. They have been delayed heretofore by fears of the Standard Oil Company.

AT Central City, Colorado, a retort containing $40,000 in gold was placed in a bank for safe-keeping. The gold was all produced in a single day by one mine.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

DOYLE.—*Ledger*, Dec. 29: This property is located in Hunt's gulch, and very favorably situated for economic working. It lies between the Amador gold mine and the Amador Queen, and has a fall of over 400 feet for water-power. Two tunnels have been run. The south or footwall tunnel is in a distance of 200 feet. It has not been worked for years, but shows a large body of gold-bearing ore. The main or hanging-wall tunnel is in about the same distance, showing an enormous ledge of quartz 60 feet wide. The quartz has a healthy look, showing dark seams running through it, which carry a large percentage of rich sulphurets. It is certainly the finest prospect for a big paying mine to be found between the Zeile and the river, considering the small amount of development work done.

AMADOR GOLD MINE.—John I. Minear, superintendent of the Amador gold mine, says there is but little change in that mine; that he is working forty odd men (besides mill contractors) opening up the ground ready to take out ore to run the mill when finished. When asked when he expected to have the mill ready to run, he said it was impossible to tell, as it depended on so many things over which he had no control—machinery from the shop, bad roads and other things which can prevent its being finished. Plans for the new hoisting works, with pump and ore-crusher attached, are now at the Pacific Works, where the iron work is being made. The superintendent expects to have them ready to run by the time the mill is finished. The crusher is No. 5 of the Gates pattern, and will crush enough in 10 hours to keep the 60 stamps going. The mill is well under way, batteries all up, mortars set and line shafting in as fast as possible; water-wheels all up and much other work done.

VALPARAISO.—A cleanup was made at this mine this week. The Huntington roller-mill was run for 13 days, on an average character of the rock, crushing about 8 tons per day, or 104 tons in the 13 days. The yield was 105 ounces, worth $16 per ounce, making a total of $1680. This result exceeded the most sanguine expectations of the owners, Messrs. Ginocchio Bros. The chunk of gold was shipped to the mint this week.

COSMOPOLITAN.—*Dispatch*, Dec. 28: The east crosscut is in 110 feet. The ore body is cut 25 feet and the hanging-wall has not yet been reached. The ore will average $5 or $6 per ton. South is in 20 feet in slate.

PLYMOUTH CONSOLIDATED.—At the Pacific shaft they are hoisting night and day, while at the Empire but a day shift is on. The Pacific shaft being much deeper, the water runs through the connecting tunnel from the Empire, and dumps into the Pacific shaft. By running days alone at the Empire, that mine will be drained before the Pacific with its double shift. The Empire mill has been running through the rock left in the mill when work suspended a year ago. It is rumored that this 80-stamp crusher is to be removed to Angels Camp, but the story is not credited.

NORTH STAR.—The winze which is being sunk in the south tunnel is now down 10 feet. The rock ran out on the west side of the winze and they are now driving it toward the hanging-wall where the ledge still exists, although only a few inches in thickness. Work in the end of the tunnel is temporarily suspended while the winze is being put down. They have about 15 tons of very rich rock locked in a storeroom in the mine.

CUPPS.—Some villain set fire to the hoisting works on this mine last Monday night and it was entirely consumed by the flames. Mr. Cupps, last week, paid off the entire indebtedness and is now in San Francisco making arrangements to start the mine. The fire will be a detriment to the resumption of work.

NEW LONDON.—They are still driving the crosscut in the north tunnel on this property. For a time it looked as though a ledge of immense width had been encountered, as they had not met the wall when in a distance of 25 feet. The superintendent says the ledge, which is rich, runs east and west.

LADY BEDFORD.—J. N. Gillenwater, owner of the Lady Bedford, near Plymouth, has just made a trial run at the Empire mill on 30 tons of rock taken from his mine. The yield was entirely satisfactory, and Mr. Gillenwater will make immediate arrangements toward opening out his mine and erecting a mill.

POTOSI.—The shaft of this mine has been idle for some time, and also neglected; so the hoisting works and everything for 20 feet around it caved in last week. It will cost more to fix it up than to sink a new shaft.

OVERPLUS.—This mine, situated at Quartz mountain, is looking well. The Huntington mill has been closed down for a few days, but will start again on January 1st.

GOVER.—They will turn on the water this week from the new pipe, and will run the mine and mill with less water than they were using at the mill heretofore.

CAUCASIAN.—A. M. Vaughan, owner of this property, has just opened and cleaned out the shaft, and found a well-defined ledge of good-paying ore therein.

NORTH CALIFORNIA.—At the North California they are still taking out ore from the west crosscut.

Calaveras.

SALE.—Calaveras *Prospect*, Dec. 29: It is reported that a sale of the Nevills and Confidence mines in Angels has been made to an English syndicate. Mr. Lloyd, the representative of the company, was in town during the week.

El Dorado.

BULLION-PRODUCER. — Placerville *Republican*, Dec. 29: The old Granite Placer mine at Smith's Flat is coming to the front as a bullion-producer. This mine is on the same range, and is of the same material as the Mayflower and Dardanell mines at Forest Hill, and bids fair to be equally as productive. It is on the same channel and near the old Prospect Flat claim which yielded to its owners over one million and a quarter in gold. The Granite was opened in early times and produced a large amount of gold, but for some reason or another, like many other good mines of that time, work was suspended and it lay idle for many years. Mr. Thos. Potts (the lucky owner) ran a tunnel and struck a bed of blue cement gravel four feet thick, yielding about $6 to the carload of 800 pounds.

Fresno.

THE HILDRETH MINES. — *Expositor*, Dec. 26: "Things are looking very bright at Hildreth," said a gentleman from that camp this morning. "There has been a rich strike made on a location which is an extension of the same ledge on which the Morrow mine is located. This location is made on the east end. The ledge at this point shows free gold all through the rock. The ledge is not large, but very rich. Of the Hildreth mines, the Abbey mine is the only one that has been developed. There are a great many promising prospects, which, when developed, will make prosperous mines." "I hear that several men have been discharged from the Abbey mine; how is that?" "I will tell you. The Abbey mine had caught up to the development work, and it was necessary to open up more ground and the men were discharged for a time, the former large force not being required. The ledge in the bottom of the mine is more regular and stronger than ever. Let me give you an idea of the ground worked out in the mine. It comprises 1000 feet in length and 700 feet in depth. The tunnels, levels, upraises, winzes and lateral drifts necessary to work out this amount of ground would extend fully the distance of a mile. This work has been done by muscle, hammer, drill and giant powder, as the rock is very hard. The company is now developing new ground, and shortly there will be more men employed in the mine than during any time in its past history. I look upon the Hildreth mining district as one of the most promising in the State. I believe mining there is just in its infancy, when compared to what it will be in a few years. The company that has purchased the Morrow mine is a strong one, and will give new life to the camp."

REPORTED SALE.—Fresno *Expositor*, Dec. 26: It is reported on good authority that Jesse Morrow has sold his mine in the Hildreth mining district to parties in Los Angeles, represented by A. James of that city. The property is located three-quarters of a mile north of the Abbey mine, the latter property Mr. Morrow having sold in 1885. The parties who have bought the mine are largely interested in mining in Southern California, owning several valuable mines in the Calico district, San Bernardino county. The price paid for the mine remains as yet a secret. The mine comprises two claims 600x1500 feet each. The quartz taken from the claim is free-milling gold quartz. It is estimated that it will yield from $12 to $40 a ton in free gold. All the quartz carries more or less silver. The average width of the vein is 18 inches, and is very regular so far as developed. This mine was worked in the early days and some valuable specimens taken out. What little work has been done on the claim has been accomplished by hand and without the aid of machinery. It is understood that if the new company does not purchase the machinery of the Golconda mine, new machinery will be bought and work on the mine started at once.

Mono.

THE BRYANT.—Homer *Mining Index*, Dec. 29: The Bryant mine, 1500 by 600 feet in extent, is located on the southeastern slope of Prospect Mountain, on what are known as "the May Lundy veins," being the south extension of the Lakeview, which is the most southerly of the May Lundy group. Two parallel veins, averaging from two to seven feet in thickness, crop out boldly, and can be traced from the north end through the claim until they disappear under the overlying talus well toward the base of the mountain. The veins have the same trend and dip as in the May Lundy, and are filled with the same character of high-grade gold ore, which is to a considerable extent incased in porphyry carrying gold enough to give a very healthy prospect. Owing to the well-established fact that they have a good mine—one that will increase instead of depreciate in value, the owners have been disposed to take things easy and do but little on it; but by so doing they are pursuing a badly-mistaken policy. The developments have been confined to the east ledge, and consist of an incline on the vein, near the north end of the claim, 115 feet in depth, with a drift north from its bottom 80 feet on the vein; also, a drift south 45 feet. A stope was worked below the level of the south drift 20 feet, and a limited amount of stoping was done above it.

Nevada.

THE STOCKTON MINE.—*Tidings*, Dec. 27: Mr. P. G. Gardner of Stockton, a former resident of this township, who owns the Stockton mine, about a mile below the Limekiln, on Wolf creek, is in town on business in connection with his mine. This mine was worked years ago with good results, and Mr. Gardner is now getting up a company at Stockton to develop it fully. It is proposed to run in a tunnel 1800 feet, which will strike the ledge at a depth of 500 feet. The tunnel is now in several hundred feet. Mr. Gardner describes the ground of the Stockton as similar in formation to the famous North Star mine, and he considers the prospects of the property as very promising.

NORTH STAR DIVIDEND.—Grass Valley *Union*, Dec. 29: The North Star Mining Co. of this district will on Monday next pay a dividend of 50 cents per share, amounting to $50,000, which will make the third dividend of the same amount paid within the last six months. The mine is yielding finely, and never looked better than it does at the present time, and by addition of ten more stamps to the mill, which has just been made, the product of the mine will be considerably increased.

Napa.

QUICKSILVER.—*Calistogian*, Dec. 26: The Napa Consolidated Mine in the Oat Hill Mining District is one of the most valuable pieces of quicksilver mining property in California, except, of course, the New Almaden, in Santa Clara county; and even the latter by no means affords the per cent profit on its stock that the former does. The Napa Consolidated has been, and is, a remarkable mine. In 1878, 3050 flasks were shipped from it, and 3646 flasks in 1879. A small furnace was then used, and the opinion was entertained, on account of the formation of the ground, that the property of the company would not long pay stockholders, and would be abandoned. Twice since 1876, the prospects have been very dark, but further deposits of cinnabar were found, and shipments of metal have been made right along the past 11 years or more with but very little interruption. Perhaps the darkest time in the history of mining there was when Superintendent M. G. Rhodes left it and went to the Ætna mines. Then there seemed to be little cinnabar left. This was the opinion of every one acquainted with the property. Work was continued, however, by another superintendent, or superintendents, and a little more cinnabar was found; but the management was bad and a change became necessary. B. M. Newcomb was then placed in charge. Afterward a new furnace was put in operation, more cinnabar was brought to light, and the property has produced remarkably well, the present superintendent evidently having done his work judiciously. The present year, shipments have been heavy, showing an increase over those of 1887, also, shipments of 1887 over those of 1886, as shown by the following table, kindly furnished us by Superintendent Newcomb, the figures for each month indicating the number of flasks:

	1886.	1887	1888.
January	167	188	235
February	201	215	223
March	200	220	288
April	176	277	324
May	145	200	320
June	125	220	345
July	107	260	248
August	82	220	347
September	86	270	370
October	132	240	440
November	169	240	475
December	205	330	450
Totals	1785	2880	4065

Plumas.

RICH GULCH.—*National*, Dec. 22: The Hallsted mine, located on Rich gulch, is being steadily worked with good results. The rock for the last two months has averaged $6 per ton for a width of ten feet, the balance of the ledge being of lower grade ore. The owners have a good mine.

RICH GROUND.—Richards & Blakesly have struck very rich pay at Newtown in the ground lately in litigation. They are working through a shaft and making about an ounce per day to the man. Two pieces were picked up last week, one valued at $73 and the other at $35. They are running a tunnel, and the ground so far as prospected is equally as good as that already worked.

Shasta.

FROM IGO.—Cor. Shasta *Courier*, Dec. 29: P. Gibney has a force of men running a tunnel to tap his Grand Central 200 feet deep. It is being run in from the Kanaka creek side of the ridge. He is also doing some work on his Arizona claim. H. Rothwell has his Crystal bonded, with fair prospects of its being sold. Shaffer has out a good-sized pile of ore, and is running the same through Bull's arastra. J. P. Wright is taking out ore, and will start his arastra in a few days. C. J. Russell is taking out ore at the Atlantic on shares, the same being worked in Shirland's arastra. E. L. Ballou's arastra is running on his Hope ore. Assessment work is being done on several claims. Gravel miners about Igo and Muletown are ready for water.

MIDDLE CREEK.—Cor. Redding *Free Press*, Dec. 29: The mining interests of this district are looming up, and by spring I think there will be several important sales made. We understand that the owners of the tellurium mine have got a very good offer for their property during the past week. A party from S. F. offers to put up a mill and plant on the mine to cost $14,000, and to pay the owners of the same $10,000 in six months after the mill is in running order, and $10,000 in one year. We also understand that Mr. Ironsides has bonded his mine to parties in San Francisco. The Gem M. & M. Co. has bonded its mine and mill to some Eastern capitalists. We hear that our old friend P. Donahue has struck a good thing at Dog creek in the shape of an old channel. Patsy says he is making from $3 to $5 a day. He also reports good news from the quartz claims on Stacy and Clear creeks; says that at these points will be lively camps next spring. Talumet has been shut down for the holidays. Mr. A. B. Paul has gone to San Francisco to visit his family.

OLD DIGGINGS.—The Walker Bros. at Old Diggings are running their mill on very rich rock. Not having the tramway to their mine finished before the recent storm, the hauling of ore has ceased temporarily. Yet there is quite a lot of rock on the dump. George Martin has a rich discovery to the west of the old Seamans mine. He has a tunnel in 100 feet—all the way on a well-defined ledge of rich rock. The owners of the Seamans mine are negotiating a sale.

LOWER SPRINGS.—Work will be resumed at the Lower Springs mining camp as soon as the weather will permit by the Ottawa Mining and Milling Co., under the supervision of B. Jones, president, and George Atkins, superintendent. Mr. Rhoads is back from Illinois to oversee the building of his calcine furnace and chlorinating process in connection with the company.

Sierra.

MARGUERITE MINE.—Sierra *Tribune*, Dec. 29: Mr. Fred Morris, superintendent of the Marguerite mine, arrived from below night before last. All work is suspended at the mine for the winter, as it was found that with the present facilities the water could not be handled, and it is now too late in the season to get in a pump. Mr. Morris leaves in a few days for the East to confer with the owners. Work is to be resumed in the spring. Considerable ore was run through the mill, and the results obtained therefrom are said to have been entirely satisfactory to all concerned.

TUNNEL.—On the ridge below the Mountain House several tunnels have been started recently to strike the ancient river channel which courses through there. James W. Hammill and J. E. Johns have taken a contract to run 100 feet of tunnel at the Dayton Consolidated quartz mine.

Siskiyou.

PLACER MINES. — Yreka *Journal*, Dec. 27: Schroder & Werner have shut down mining operations at their mine and mill at Deadwood creek, having had a very successful run during the past summer and fall with some 25 hands employed. The river miners are still able to continue operations in taking out pay gravel, as there have been no storms or freezing weather to interfere, in fact the weather could not be more favorable. The hydraulic, placer and high gulch miners are unable to do much work at mining yet, owing to the dry time prevailing, the few showers so far being just heavy enough to only keep the roads muddy. The quartz miners have an abundance of quartz ready for crushing, and are anxiously waiting for storms to supply the streams in affording water-power to start their mills, but few of the mills being run by steam.

QUARTZ.—Mr. Frazer has put up a new five-stamp mill at Indian creek to crush a large body of low-grade ore in the old Golden Eagle ledge. He expects to reduce the quartz under a new process at a cost of $2.50 a ton, and it will yield at least $4 to $6 per ton. There are no doubt many ledges in the county of same style, containing a vast amount of quartz not worked on account of the cost of crushing, that would prove profitable with a cheap process of $2.50 a ton.

Trinity.

EAST FORK.—Cor. Trinity *Journal*, Dec. 26: There is no need of booming our mines now, as they are an assured success. Any one traveling along the back-bone trail to New river can learn this, for the steady drop of the stamps can be plainly heard from the Golden Chest and North Star, and better yet, they are dropping on gold ore in paying quantities—not waste. Many new prospects have been found this summer, and older ones are being steadily developed with bright indications ahead. On Yellow Jacket, a branch of the East Fork, most of the new lodes were found. Among those spoken of are the Alaska, a vein four feet in width, owned by Mr. Nickol. The Happy Dream group, consisting of three locations, join the Alaska, and judging from samples taken from the croppings they are worth owning. The Davis Bros.' location on the same stream is said to be looking well. The Ozark, on Rich gulch, has been closed down for the winter, it being very wet during the rainy season. Considerable ore is at the arastra, which is run night and day. The different mines owned and controlled by Capt. Trueworthy, on Barney gulch, are showing up finely; several hundred tons of ore on the different dumps lead one to believe that the Captain means business. Considerable ore from the Fountain Head is stored at the Thanksgiving arastra to be crushed as soon as water comes. Development on the Webfoot is being done, and an arastra will be built in the spring with which to work the rock. The lode varies from one to seven feet in width. The North Star and Linnie are strong veins; the mill, however, being only a five-stamp, is entirely too small for the amount of rock that can be taken from the mine, as there is no waste, the lode being four feet wide between walls and easy ground to work; consequently a large amount of ore can be extracted per day to the pick. The Enterprise Co.'s mines are looking as well as usual, and the ore as rich as the croppings when first worked. New buildings were put up this fall, an apron built on the dam and a 10-stamp mill purchased, which is a pretty sure sign of prosperity. Under the superintendency of Mr. Arnold the mines are being finely developed and a large amount of stoping ground opened up. There is enough in sight to run the arastra for the next three years. The Yellowstone mines, which have lain idle for so long, started up this fall. Under the supervision of Superintendent Paxton they are showing up in fine shape. A long tunnel has been run, tapping the vein 150 feet deep. A new road from the mines and a good bridge across East Fork, to the arastra, was recently built. The arastra is running on rock from the mine, and report says it is very good. A new ditch from the East Fork is being dug, and appearances indicate a mill next spring. The only placer mine on the creek that gives us a salute once in a while in shape of a boulder blast, is owned by Smith, Watron & Hubbard. The Golden Chest Co. was enabled to start its mill by the fall rains raising the water in East Branch, but owing to unseasoned timber having been used in erecting the mill a shrinkage of the battery blocks caused a slight delay, which, however, was soon remedied and all is now running smoothly. The heavy expense incurred by building new trails, packing the machinery 16 miles over a rough country, and developing the mine entitles them to success. Krumpe & Co., one mile above the last-named company, have a fine prospect. Work will be pushed ahead this winter and if by spring it still shows up as well as at present a good mine can be seen by a visitor to that section of East Branch.

Tuolumne.

WATER OUT.—Tuolumne *Independent*, Dec. 29: The water is now all out of the Eureka Consolidated, and as soon as the slum is cleaned up they will commence hoisting ore. The 20-stamp mill is probably the finest and most substantially built in the county. Eight concentrators and every necessary appliance is provided for working the rock, and it is expected that this mine will prove among the best.

NEVADA.

Washoe District.

CROWN POINT.—*Enterprise*, Dec. 29: The No. 3 west crosscut on the 700 level is out 50 feet, having been advaneed 24 feet since last report. The face is in clay, porphyry and low-grade quartz. The 700 raise is up 50 feet, having advanced 14 feet since last report. It has continued in good ore. The 800 east crosscut is in 57 feet. The face is porphyry and low-grade quartz. Have about 25 feet to go under the 700 level raise.

SAVAGE.—On the 400 level the northeast drift has been extended 27 feet, the main west drift 19 feet and the southeast drift No. 2, 26 feet. Are extracting ore from the southwest and northwest drifts. On the 500 level the main west drift was advanced 23 feet. Are extracting ore from east crosscut No. 1 and from the old stopes. Are also extracting ore from crosscuts Nos. 2 and 3 on the 600 level and from the old stopes on the 700 level. During the week have hoisted 512 tons of ore and have shipped to the Rock Point mill 488 tons, the average battery assay of which was $17.79 per ton. Have bullion on hand and previously shipped this month amounting to $10,226.36.

HALE & NORCROSS.—On the 500 level work in the main west drift has been temporarily discontinued. The face of this drift continues in favorable-looking ground. The north drift has been advanced 20 feet, and continues in the same quality of good ore heretofore reported, which we are stoping and sending to the mill. On the 600 level the west drift has been extended 25 feet. The face of this drift is

in good ore, which we consider to be the downward extension of the same ore which they are stoping on the 500 level. On the 800 level the east crosscut has been advanced 25 feet. The face is in clay and porphyry. The southwest crosscut has been advanced 20 feet; total distance, 90 feet. Have resumed work in the face of this crosscut and in the south drift. Are extracting ore from the stopes between 500 and 700 levels, which continue to yield the usual quantity of good ore. During the week have hoisted 961 tons of ore, and have shipped to the Mexican mill 1011 tons, and reduced 1050 tons. Average battery assays, $29 24 per ton. Have bullion on hand and previously shipped for the month amounting to $67,288.32.

GOULD & CURRY.—On the 200 level the north drift started 100 feet from top of upraise from 300 level has been extended 16 feet; total length, 120 feet; formation, porphyry with streaks of quartz. In this drift at a point 104 feet from west crosscut No. 1, west crosscut No. 2 has been extended 12 feet; total length, 42 feet; formation, hard porphyry. On the 450 level west crosscut started 60 feet from top of upraise from 500 level has been extended 20 feet; total length, 166 feet; formation, hard porphyry. On the 625 level work of repairing the main south drift is still in progress.

BEST & BELCHER.—On the 300 level the north drift 25 feet west of the winze has been extended 16 feet; total length, 90 feet; formation, porphyry, clay and quartz, showing some value. Incline winze has been sunk a total depth of 100 feet; formation, porphyry and quartz, showing some value. On the 625 level, work of repairing the main north drift is still in progress.

BELCHER.—The 200 north drift advanced 30 feet since last report, making its total length 288 feet. No change to report of the material in the face. The level drift to meet it advanced 20 feet. Have now cleaned out and repaired 226 feet of the 1100 north drift. The joint 1100 south drift advanced 49 feet since last report, making its total length 245 feet.

CHALLENGE.—The joint Challenge-Confidence raise from the 1300 level has been stopped for the present, as they have commenced drifting south on the vein on this level. This drift is in 17 feet, the face showing quartz of low grade. Shipped during the week, to the Brunswick mill, 98 tons of ore, the battery samples of which show a value of $26 per ton.

CONFIDENCE.—The raise from the 1200 level to connect with the 1100 level is up 105 feet, having been advanced 10 feet during the week. The top of the raise still shows ore of fair quality. Shipped during the week to the Brunswick mill, for reduction, 500 tons of ore, the battery samples of which show a value of $25 a ton.

JUSTICE.—The raise from the north drift is up 42 feet, the top of which shows five feet of good ore. The west drift on this level is now out 230 feet. Are making good progress in cutting out the shaft station on the 370 level.

IMPERIAL.—East crosscut No. 1 from the main north drift on the 1100 level is out a distance of 81 feet 24 feet having been added during the week. The face shows vein material of no value.

SEGREGATED BELCHER.—The joint 1100 south drift is now out 245 feet, having advanced 49 feet during the week. The face is in vein matter composed of clay and porphyry.

OVERMAN.—Have extracted 272 tons of ore and shipped 333 tons to the Vivian mill during the past week. Nothing new to report. All running as usual.

YELLOW JACKET.—Shipping 100 tons of white rock gold ore during the week, and are doing good prospecting work.

BALTIMORE.—There is nothing of importance to report in the work this week, beyond progress in the several drifts.

ALTA.—The usual work is reported in the mine. Extracting and reducing about 30 tons of ore per day.

BULLION.—The winze below the 640 level has been sunk 67 feet. The machinery is running well.

ANDES.—The usual progress is making on the 240 and 350 levels.

SCORPION.—The west crosscut on the 200 level is out 350 feet.

Aurora District.

POWER FOR MILLS.—Walker Lake *Bulletin*, Dec. 26: Surveyor Garrard has been engaged for the past week in surveying a route for the proposed line for the transmission of electricity from East Walker river to Aurora, at which place it is proposed to utilize the electricity in running quartz-mills. The electricity is to be generated by a dynamo placed in the river 12 miles from Aurora, and the object is to transmit force on a copper wire sufficient to propel the mills. Should the Aurora venture prove successful, it will revolutionize our principal industry and give an impetus to mining that could proceed from no other cause. There are deposits of low-grade ore of almost limitless extent on the Comstock, but the high cost of extraction, hauling and milling at present preclude the possibility of their being worked. Should the Aurora experiment prove successful, ore that will yield $5 per ton can be worked at a handsome profit to the stockholders, and in such an event our mines will continue to pour a stream of precious metal into the lap of the world for a hundred years to come.

Ely District.

FREEMAN'S DRY PROCESS.—Pioche *Record*, Dec. 29: The Ely Gold Mining and Milling Co. has just received one of Freeman's dry process separators, of a 50-ton per diem capacity. Experiments on a small scale have been made both here and at Osceola with the machine, and these experiments have proved satisfactory, and verify all that has been claimed for the process, viz: That it will save free gold, that is in the gravel, sand, or pulverized ore run through it. The Ely Co. will give it a thorough test, and if through it they can save all the gold in their pulp, a rich harvest awaits them.

El Dorado Canyon District.

THE MINES.—Cor. Pioche *Record*, Dec. 27: Thinking that a few facts from this remote corner of Lincoln county will be of interest to your readers, I send you a few items. We do not often see our operations in print, as in this camp there are mines operated by poor men who are not able to give them that systematic development which usually results in success. Districts like this that have been worked a long time are more likely to be neglected in this respect than new and booming ones. The S. W. Mining Co. is working 10 or 12 men on the Wall Street. J. M. Pickett is foreman. The rates of the company on custom ore that requires roasting are $30 per ton, and they give 76 per cent of the assay. T. J. Partridge is engineer at the mill and Frank Reed is pan-man. Among outside prospects may be mentioned the Silver Sequin. It has a shaft down 180 feet and a drift 50 feet from the bottom, all in ore. It is at present lying idle, owing to partnership complications. A railroad to the Vegas would bring these mines within 40 miles instead of 100, as now from here to the Needles on the A. & P. by the tedious and uncertain river route. Then the old argument of isolation could not be urged, old enterprises would be stimulated and new ones started. The resources of the Vegas valley are considerable. The surrounding mountains are covered with splendid timber, and vast bodies of low-grade lead ores are known to exist.

Garfield District.

IN BONANZA.—Cor. Walker Lake *Bulletin*, Dec. 26: There has been great joy at the Great Western mine, for in the lowest workings of the mine, some 500 feet below the surface, a rich body of ore, such as this mine since its first discovery has been famous for, has been uncovered in sinking a winze. The pay streak is about 18 inches wide and will assay well up in the hundreds (of ounces).

Golconda District.

THE ADELAIDE COPPER MINE.—*Silver State*, Dec. 26: The hoisting works on the Adelaide copper mine at Golconda were completed last Saturday. On Monday the machinery was tested and found satisfactory in every respect. There is sufficient power to work the mine to its fullest extent for a thousand feet. The work of sinking the main shaft will be resumed immediately and pushed rapidly this winter. The recent storms have raised the water in the creek considerably and it is thought there will soon be enough to start the furnace. There is a large supply of coke ore already at the works and smelting will be a matter of short issue as soon as the water increases a little.

Gold Run District.

PLACER MINES.—*Silver State*, Dec. 26: A sale of the Gold Run placer mines is being negotiated, the consideration it is said being $15,000. The mines are owned by Judge Bonnifield and Paul Pinson, who have expended considerable money in getting water on the ground. The gold obtained from these mines is coarse and worth $18 per ounce.

ARIZONA.

AROUND PRESCOTT.—*Journal-Miner*, Dec. 26: Placer miners have an abundance of water to carry on their vocation. Dan Hatz had some very rich specimens of gold rock to-day from his Ruby mine. Work is still being pushed on the Congress mine, and shipments of ore are being regularly made. A number of mining sales are still on the tapis, with prospects very favorable for their consummation. Louis Himmelreich arrived on Saturday night's train, to take charge of the construction of the Copper Basin smelter. Frank Alters has about 15 tons of ore from the Catoctin mine sacked, ready for shipment as soon as a pack train can be engaged. Hon. W. A. Rowe was in town to-day from his mining camp. He is developing his claim and shipping but very little ore, preferring to allow it to remain on the dump. I. T. Stoddard, president of the Oro Bella Mining Co., reports the sale of the United Verde copper mines at Jerome to W. A. Clark, who has been working them for several months under a lease. Dan Hatz sent a sample of ore from the rich strike he made in the Ruby mine, to Chicago, to be assayed. He has just received the returns, which give a value of $51,000 per ton, or $25 per pound, in gold, besides several dollars in silver. As there is at the present time more interest manifested by capital in this section and more inquiries for investment than for years before, our advice to miners is to work their claims with all the force and energy possible. The better a claim is developed the better the prospect for its sale. F. M. Murphy, superintendent of the Congress mine, returned to-day from a visit to the new strike near the Centennial mines, and brought with him a few specimens from it. He says there has not yet been sufficient development done to form an opinion as to the ultimate possibilities of it, the deepest workings not exceeding ten feet. The strike, however, he says is remarkable, as the parties have already taken out between $30,000 and $40,000 in gold nuggets and rich gold-bearing quartz, which they have sacked up. The country is being located for miles around, and there are a great many people in camp. As yet, the owners of the original claim have not even prospected the entire width of the ledge, although they have still a large quantity of rich ore in sight.

BONANZA CAMP.—Clifton *Clarion*, Dec. 26: There is considerable work being done in camp at present. Col. Ingram is having the assessment work done on all of his claims, and they are showing up finely. Messrs. Campbell & Muir's properties are looking exceedingly well, and as development progresses the ledges are improving both in size and richness. Capt. N. L. Jenkins, who last week shipped ten tons of high-grade ore from the Pittsburg claim to Denver, Col., is preparing to make another shipment of a carload. He is now down 60 feet on the claim, and is sinking and drifting. The mine shows much improvement. Capt. Jenkins has our best wishes. He shows what a man can do for a camp who has a little capital and a great deal of energy. Messrs. Higgins & Mullen are reported to have struck it rich near Morenci, and Thomas Haughey has also encountered a large body of rich ore on his claim. The returns were received the past week from a shipment of glance ore from the Carrasco group of copper mines near Morenci. Three hundred sacks were forwarded, which returned to the owners the sum of $1305 net. The expenses of freight and treatment were $442, giving a gross product of $1747, or nearly $6 a sack—truly a wonderful showing.

COLORADO.

IDAHO SPRINGS.—*News*, Dec. 29: A big strike was made last Saturday in the lower level east on the Kangaroo. F. C. Taylor is getting out large quantities of ore from his Windsor Castle lode. Water is being taken out of the Clarissa this week and work will be resumed at once. Work will be resumed on the Denver View about Feb. 1st, with W. S. R. Gow in charge. Some of the boys down from the Mary Foster report that some rich ore is being hoisted to the surface. El Dorado up Ute creek is being systematically developed. This lode is very close to the famous Lamartine. John Morris sent down a large lot of smelting ore last week from his Indiana prospect. The ore is low grade. The Champion mine is running eight levels, in all of which there is good paying mineral in large quantities. Mathews & Co.'s sampling works are having a large run this week. The Lake lode continues to produce steadily and there is considerable development work being done on the property. Nicholas & Miller, lessees on the Eclipse lode, opened up a new streak of ore last week. They will make a shipment next month. Bowden & Smith have disposed of their interest in the Cavern lode situated just above the Albro mine, to Eastern parties for $10,000. The old Albro at Dumont is in pay again. Quite a big streak of low-grade ore was recently encountered in one of the workings.

IDAHO.

LAST CHANCE.—Wardner *News*, Dec. 22: Work on the lower tunnel of the Last Chance mine is progressing rapidly, a distance of 585 feet has been reached, and the work of development is continued on the vein in an easterly direction, the full size of the drift being in ore. Its vertical depth is 248 feet from the surface.

ALMA CONSOLIDATED.—During the last three months extensive and most important developments have been made on the group of mines on Elk and Deer creeks, owned by the Alma Consolidated Mining Co., and as work continues most satisfactory results are attained. Two shifts are employed on the Alma tunnel on Deer creek running on the vein, through the mountain, simultaneously with two shifts working on the Alpharetta, to connect both; the distance between the heads of the tunnels is about 300 feet and the connection will be made about the first of February. The Hawkeye and Alma are waiting the completion of this tunnel to add their output to the mill. The crosscut on the 200-foot level in the Minnie Vernie develops the same body of ore as found in the upper workings. This grand showing at that depth establishes beyond all doubt the great value of the mine, which now can rank among the very best gold properties yet discovered. The stopes are looking splendidly; every chute is full of ore and there appears to be nothing wanting but the erection of extra machinery which will be added to the present plant early in the spring.

PONY GULCH.—Since the starting of the mill on the Fay Templeton, enough work has been done to establish the fact that both mine and mill are a financial success. On every pay-day all demands have been promptly met, besides the payment of large amounts for deadwork, and before long the owners can hope to come in for dividends. From statements previously published it might be inferred that the last cleanup of $3400 was the entire result of the first month's run. This is not correct, as a previous cleanup was made and the bullion shipped as it came from the retort to the San Francisco mint which amounted to within a fraction of the last return. E. W. Derry, who erected the Huntington mill in use here, has had much experience with similar plants in California, and he pronounces them unexcelled in all their workings. Mr. J. H. Seek of San Francisco is now in charge as amalgamator.

LOWER CALIFORNIA.

CONSOLIDATED MINES.—San Diego *Union*, Dec. 27: The Consolidated St. Nicholas & San Francisco Gold Mining Co. of Lower California, which now has control of the two well-known mines just north of Real del Castillo, in the heart of the famous gold belt which, during the past year, has been inspected for the first time in nearly 20 years, has gone into the work of development with an energy and determination that promise speedy and magnificent results. Nearly every steamer for a month or more has carried machinery and supplies for the consolidated mines, and the work is being pushed in a thorough and practical manner. At the St. Nicholas mine there are three shafts, two with a depth of 90 feet and one of 30 feet. In the San Francisco there is a horizontal tunnel of 70 feet, which has developed several pockets. The ore is free mining and milling gold quartz from medium to high grade, and in quantities apparently inexhaustible. The officers of the company are as follows: President, R. Bigsby; secretary, I. R. Bigsby; treasurer, J. H. Ballagh; directors, A. Morales, J. M. Ybarra, J. H. Ballagh, R. Bigsby, T. M. Glenn, W. H. Brockmann, I. R. Bigsby.

MONTANA.

FROM PONY.—Cor. Virginia City *Madisonian*, Dec. 26: Messrs. Boyd, Long & Co. crushed in Elling & Morris' mill last fall a large amount of ore from the old Pat O'Harra and an adjacent mine, which yielded a fair return for their labor, and then the same stamps pounded $76 per ton out of 31 tons of Messrs. McKittrick & Mood's Gilded Age, which mine is looking splendid at a depth of 80 feet, with a large amount of rich ore in sight. James Boyd and Ed Yates have leased the White Pine and are prosecuting work with vigor. Mr. Ritchie of Butte has purchased the Yukon lode above town, and has two men at work who are finding very flattering prospects. During the summer and fall Judge Duncan, with his corps of miners, has been making runs in the Pony and Red Bluff mills from a mine on Norwegian, the ore yielding from $25 to $40 per ton. Messrs. Elling & Morris have a force of men at work on their Clipper lode extracting free-milling ore from a four-foot crevice, much of which assays $500 per ton, while the great bodies of base ore in their Willow Creek, Boss Tweed, Strawberry, Keystone and other mines stand glistening in silence in huge crevices, awaiting the advent of a railroad to transport them to some smelter. And why shouldn't we have a railroad as well as other less favored localities? We have these Mineral hill mines, which of themselves would justify the building of one. We have the Potosi silver mines, a few miles up Willow creek, with a splendid showing so far as developed. We have the Norwegian placers, four miles from here, while 12 miles east are the famous Red Bluff quartz mines. The same distance south is Richmond flats with its great Revenue mine, now operated by a strong company with a large force of men and with their mill running steadily with handsome results. Still further southeast, six miles, are the Meadow creek placer mines, recently purchased and now worked by a large flume company, while at the head of same creek are a number of very promising gold lodes. In addition to all this I will mention some rich and extensive bar diggings on the Jefferson river, 12 miles north of here, owned by N. J. Isdell, which will soon be worked extensively by means of water conducted from the Jefferson.

DIPS, SPURS AND ANGLES.—Phillipsburg *Mail*, Dec. 29: Con Peoples will commence sinking the shaft on the Ant this week. The Ant is the adjoining property to the Wasp, which Mr. Peoples sold to the Granite Co. not long ago for $10,000. Joe Annear finished his contract with the Bi-Metallic Co.—the stonework at their new mill, last week. All other work is rapidly nearing completion and the Mammoth mill will soon be in readiness to put the machinery in motion. John M. Long, who is working some mines over in Harvey Creek district, is actively developing and has three men employed. It is claimed that they have a big thing over there and intimated that with the opening of spring a very rich thing will be disclosed. It is a gold property and is a mine already. There has been considerable talk lately regarding the Trout mine and the possibility of its starting up again this season. There will certainly be something done with this property in the near future, but it is so wound up by litigation at present that it will require months to put it in shape for any one to proceed with the work. John Caplice of Butte, one of the principal stockholders, is now in St. Louis, trying to quiet the title.

NEW MEXICO.

AT WORK.—Silver City *Enterprise*, Dec. 29: John A. Miller of this city is now prosecuting work on the Hidden Treasure, at Lake Valley. He has leased the Virginia to Judge W. P. Keil, who is doing quite well. Last week Idus L. Fielder disposed of a one-half interest in the Centralia, Central district, to A. T. Ward, a mining man of experience, for $5000 cash. Development work will be commenced on the mine in a few days. The Yankee Girl is looking well. George Goodwin brought in a few hundred pounds of specimens that would make a good showing from any camp. "Sandy" McCorkle, who is mining at Bald Mountain, states that he has encountered a considerable amount of high-grade ore, and feels encouraged at the prospects. He is in charge of the work being done there by a St. Louis Co. Peter Mungall, while doing the assessment work on the Red Cloud, at Black Hawk, owned by W. G. Shedd and Mrs. John Black, made a strike, which for richness it is said cannot be excelled by anything in that camp, which has produced many tons of ore worth from $6 to $10 per pound. The extent of the strike has not yet been determined.

MINING DEALS.—Kingston *Shaft*, Dec. 26: Six important mining deals are about to be consummated on North Percha. Thomas Cahill and William Burns are working a force of men on the Gallilio. Four important mining deals made this week on the Terra Blanca. The Caledonia mine has increased its force and is taking out plenty of good ore. The Lady Franklin mine continues to work although the water is very difficult to handle. R. P. Van Horn & Co. have out, ready for shipment, one carload of high-grade ore from the Gypsy mine. The Uncle Jack now has at the least calculation $10,000 worth of ore in sight, and is making arrangements to stope it out. Ed Baird sold this week his one-third interest in the Lone Star mine to Judge Burns for $1000. This claim is on Sawpit gulch, and on the same ledge as the Gypsey and Gallilio mines.

OREGON.

RICH STRIKE.—Bedrock *Democrat*, Dec. 27: From parties down from Cracker creek we learn that a rich strike was made a few days since in the Excelsior mine, and the ore being taken therefrom is so rich that it is being sacked just as it comes from the ledge without being assorted. The ledge is wide and increasing, and Supt. Donaldson is highly elated over the prospects, and when the good news is telegraphed to the owners in the East, it will give them renewed confidence in the mines of Baker county.

A MINING DEAL.—O. S. Buckland, the Sparta merchant, and duly empowered agent of Rufus Perkins of Polo, Illinois, has been in Baker City the past couple of days transacting important business. He informs us that he has purchased in the name of Rufus Perkins the one-fourth interest of H. W. Fowler in the Forest Queen, Queen Extension, Silona and Star mines, situated in Cornucopia Mining district, Union county, Oregon. Extensive work will be commenced on these mines in a short time and shipments made of the ore to Denver for reduction.

UTAH.

MARBLE.—Salt Lake *Tribune*, Dec. 27: Jewett B. Francis has returned from Iron county, where he has been to locate valuable marble quarries, and the samples he has brought up for polishing look remarkably good. While in Cedar City he noticed one big improvement, in that Bro. Chaffin has inclosed his residence premises with a fence, which they have been without for 20 years.

MINES ABOUT MILFORD.—Mr. B. A. Spear writes: The outlook for copper developments after the holidays is good; the head representatives of the great French syndicate are here, and seem pleased with what is in sight. Both houses of Congress should immediately pass the Stewart silver bill, and all the country west of Omaha will become alive with new industries and new people. Utah will then change front. Considerable prospecting now seems to be going on in the southwest, and in the northwest a large deposit of manganese has been discovered close to the line of a proposed railroad; the ore will average 50 per cent, and carries from $4 to $8 in gold per ton. James Hedges of Frisco is on the eve of making a sale of his sulphur mines near Antelope Springs, and only five miles west of the proposed extension of the Utah Central railway.

MECHANICAL PROGRESS.

The Manufacture of Russia Sheet Iron.

Mr. F. L. Garrison communicates to the Journal of the United States Association of Charcoal Workers the following in regard to this much misunderstood question :

There appears to be much misunderstanding in reference to the manufacture of sheet iron in Russia, and questions are frequently asked the writer : "What are the secrets connected with it?" "How is it made?" "Could admission be obtained to the iron works in the Urals, where this iron is made?" It is difficult to understand why such questions should be asked by persons versed in the literature of iron and steel, for Dr. Percy wrote a very excellent and accurate monograph on the subject a number of years ago.

Not having had the opportunity of personally visiting the Russian iron works in the Urals, Dr. Percy's paper was compiled from data furnished him by a number of persons who had actually visited these sheet-iron works. Since it has been my good fortune to have the opportunity of seeing some of these works in the Urals but a short time ago, I will, at the risk of telling an old story, briefly describe the process of manufacture as I saw it.

The ores used for the manufacture of this iron are mostly from the celebrated mines of Maloblagodatj, and average about the following chemical composition : Metallic iron 60 per cent, silica 5 per cent, phosphorus from 0.15 to 0 06 per cent. The ore is generally smelted into charcoal pig iron and converted into malleable iron by puddling or by a Franche-Comte hearth. Frequently, however, the malleable iron is made directly from the ore in various kinds of bloomaries.

The blooms or billets thus obtained are rolled into bars 6 inches wide, ¼ inch thick, and 30 inches in length. These bars are assorted, the inferior ones "piled" and re-rolled, while the others are carefully heated to redness and cross-rolled into sheets about 30 inches square, requiring from eight to ten passes through the rolls. These sheets are twice again heated to redness and rolled in sets of three each, care being taken that every sheet before being passed through the rolls is brushed off with a wet broom made of fir, and at the same time that powdered charcoal is dexterously sprinkled between the sheets. Ten passes are thus made, and the resulting sheets trimmed to a standard size of 25 by 56 inches. After being assorted and the defective ones thrown out, each sheet is wetted with water, dusted with charcoal powder and dried. They are then made into packets containing from 60 to 100, and bound up with the waste sheets.

The packets are placed one at a time, with a log of wood at each of the four sides, in a nearly air-tight chamber, and carefully annealed for five or six hours. When this has been completed the packet is removed and hammered with a trip-hammer weighing about a ton, the area of its striking surface being about 6 by 14 inches. The face of the hammer is made of this somewhat unusual shape in order to secure a wavy appearance on the surface of the packet. After the packet has received 90 blows equally distributed over its surface it is reheated and the hammering repeated in the same manner. Some time after the first hammering the packet is broken and the sheets wetted with a mop to harden the surface. After the second hammering the packet is broken, the sheets examined to ascertain if any are welded together, and completely finished cold sheets are placed alternately between those of the packet, thus making a large packet of from 140 to 200 sheets. It is supposed that the interposition of these cold sheets produces the peculiar greenish color that the finished sheets possess on cooling.

This large packet is then given what is known as the finishing or polishing hammering. For this purpose the trip-hammer used has a larger face than the others, having an area about 17 by 21 inches. When the hammering has been properly done, the packet has received 60 blows, equally distributed, and the sheets should have a perfectly smooth, mirror-like surface. The packet is now broken before cooling, each sheet cleaned with a wet fir broom to remove the remaining charcoal powder, carefully inspected, and the good sheets stood on their edges in vertical racks to cool. These sheets are trimmed to regulation size (28 by 56 inches) and assorted into Nos. 1, 2, 3, according to their appearance, and again assorted according to weight, which varies from 10 to 12 pounds per sheet. The quality varies according to color and freedom from flaws or spots. A first-class sheet must be without the slightest flaw and have a peculiar metallic gray color, and on bending a number of times with the fingers, very little or no scale is separated, as in the case of ordinary sheet iron.

The peculiar property of Russian sheet iron is the beautiful polished coating of oxides ("glanz") which it possesses. If there is any secret in the process, it probably lies in the "trick" of giving this polish. As far as I was able to judge, from personal observation and conversation with the Russian iron-masters, the excellence of this sheet iron appeared to be due to no secret, but to a variety of conditions peculiar to and nearly always present in the Russian iron works of the Urals. Besides the few particulars already noted in the above description of this process, it should be borne in mind that the iron ores of the Urals are particularly pure, and that the fuel used is exclusively charcoal and wood. Another, and equally as important consideration, lies in the fact that this same process of manufacturing sheet iron has been carried on in the Urals for the last hundred years. As a consequence, the workmen have acquired a peculiar skill, the want of which has made attempts to manufacture equally as good iron outside of Russia generally less successful. It is difficult to understand what effect the use of charcoal powder between the sheets as they are rolled and hammered, has upon the quality. It is equally as difficult to understand the effect of the interposition of the cold finished sheets upon the production of the polished coating of oxide. The Russian iron-masters seem to attribute the excellence of their product more to this peculiar treatment than to any other cause. One thing is quite certain, there is no secret about the process, and if the Russian sheet iron is so much superior to any other, it is due to the combination of causes already indicated.

Important Discovery in Pig-Iron Production.

An English letter in the *American Manufacturer* of Dec. 14th devotes considerable space to what is termed "a remarkable discovery" in pig-iron production. We copy as follows: Mr. Charles Wood, the new president of the Cleveland Institution of Engineers, has this week made public the details of the "remarkable discovery" in pig iron production, of which he, in conjunction with Mr. Stead, is the author. This discovery is that silicon has the power to convert combined carbon into uncombined carbon. In other words, it is possible by the addition of about 1½ per cent of silicon, white iron can be converted into gray, and that by regulating the proportion results similar to those effected in the aluminium and other alloys now so largely used in foundry-work can be obtained.

The hardest scrap can be made perfectly soft by judiciously mixing this silicious iron in the cupola, so that the castings will plane or turn in the latter with the greatest ease, and even curl up in front of the tool.

Such, said Mr. Wood, has been the spread of the new practice in the iron foundries of France and the continent generally, that several hundred iron founders are purchasing special Cleveland brands in place of the rich and more expensive Scotch qualities. They can there melt down large quantities of hard scrap which in some places was even buried as being too hard to use. The same thing is true of some of the foundries and elsewhere. Silicon iron has become as much a requisite with them as No. 1 Scotch was a year or two ago. One striking proof of the effect of the invention is that there is now a large and steady demand for the hundreds of tons of glazed iron which used to be returned to the furnaces in Cleveland as unsalable.

Mr. Wood explains that the discovery was the outcome of an earlier discovery that an additional 1½ per cent of silicon is sufficient to convert white iron into gray iron. The inventors afterward learned how to so regulate their iron as to stop the loss in the foundry, and which was much more, to materially add to the strength of the castings without employing higher class grades of iron.

THE FAILURE OF THE HAINSWORTH GUN, to which reference was made in this column last week, is further referred to in the *American Manufacturer*, from which it will be seen that the bursting of the first gun is not considered a failure of the principle of making steel guns by casting instead of by the slow and expensive process of "building up." That journal says: While there is no question that this gun went to pieces under a fair test, it by no means follows that a cast-steel gun is not practicable. The only thing that is proven by this test is that this particular gun, made in the particular way and of the metal this gun was made of, and tempered in the way that this gun was tempered, has proven a failure. Its failure is no argument against the making of cast-steel guns by casting them. It is a fact that a great deal of cast-iron ordnance broke in testing, prior to the making of cast-iron guns, at the Fort Pitt works in this city, but when the proper mixtures of metal and the proper proportioning of the parts, and the proper method of casting were arrived at, the result was the production of the remarkable cast-iron guns with which the name of the Fort Pitt works is identified. Now, the gentleman who had as much to do with the production of these Fort Pitt guns as any other person, and who probably knows the capabilities of cast steel as well, if not better, than any steel-maker in the world, is confident from his knowledge of gun-making, and of the possibilities of cast steel, that a cast-steel gun can be made which will not only equal built-up cast-steel guns, but will far excel them. Relative to the cause of the failure of this particular gun, we are authorized by Mr. Hainsworth to say that his belief is that it failed as the result of his own mistake in tempering or hardening the inside of the gun more than the outside, his purpose being to avoid erosion. Mr. Hainsworth thinks that if the gun had been left in its normal condition after casting it would have answered the tests. This mistake in giving a higher temper to the inside than to the outside resulted in a variety of internal strains which seriously weakened the gun, and caused its failure.

SCIENTIFIC PROGRESS.

THE SIROCCO —Most of the hot winds of the Old World are modified forms of the simoom. The sirocco originates in the Sahara and travels northward to the Mediterranean and Southern Europe, but it is not so deadly as its prototype. It brings with it great quantities of the desert sand, and the air becomes so dense at times that the sun is obscured as if by a London fog. While it remains on the African mainland it is characterized by a very marked dryness, as there are no extensive water surfaces to supply it with moisture. As soon, however, as it is launched over the Mediterranean it begins to take up copious draughts, so that when it reaches Malta, Sicily and the southern shores of Europe as a wind from between southeast and southwest, it has undergone a change from a hot, dry wind to a hot damp wind. The result of this alteration is that it becomes most enervating to the human constitution. Indeed, while it prevails from one to several days at a time, life is scarcely worth living, so depressing and burdensome is the wind. It is the *plumbeus Auster* of Horace. Human energy is quite dissipated under its fatiguing influence, and, with a temperature ranging between 95° and 110°, the streets of the towns affected by it are deserted. To the Sicilians the oppressive wind is a perfect plague, for, although naturally indolent, they cannot stand the further loss of energy induced by it. During its prevalence iron rusts, clothes spoil with mildew, meat turns putrid, grapes and green leaves wither, wine will not fine and paint will not dry. Sicily experiences the sirocco about a dozen times a year, but it is not so frequently met with in other parts of Europe. There is no mistaking the origin of the wind, as the reddish sand is still present when it arrives on the northern shores of the Mediterranean and causes a misty atmosphere.—*Cornhill Magazine.*

THE FUNCTIONS OF VINE LEAVES —D. S. Marvin says : There should be made this distinction between the leaves upon the vine : The several leaves opposite the clusters of grapes upon the lower part of the cane may truly be termed fruit leaves, upon which the development of the cluster mainly depends; the leaves at the ends of the cane are more for the development of wood and the long thinning of the canes. Of course the functions of all plants are carried on through the leaves. Sometimes there is too much of a tendency to the development of fruit, sometimes of wood. The best species and varieties of the vine are those that are somewhat evenly balanced in these tendencies. This enables the vintner to turn the functions of the plant into the development that he desires. In the case of young vines and poor growers, it is to wood growth; in mature and vigorous vines, to a greater development of fruit. If by accident the leaves upon the lower portions of the cane are lost, there are never as well-developed clusters thereon, and if the ends of the canes are clipped off at the last bunch of grapes early in the season, the leaves grow much larger, with larger clusters of fruit; but the practice can be carried too far for the health and permanence of the vine. If the most of our vigorous sorts are so clipped year after year, the vines become weakened, the health impaired, and disease follows. The skilled vintner has no fast and invariable rules; he is governed by the condition of each vine. If he wants more fruit from a healthy, strong vine, he shortens the cane and throws the force of the vine into better developed clusters and leaves at the base of the canes. Experience has demonstrated that this process can be carried on from year to year, provided he does not trim too close, say from one to four nodes beyond the upper clusters under ordinary conditions, and one node for the side shoots.

A FLORIDA RIVER.—The Sopy-chopy is certainly one of the wildest, most gloomy streams that I have ever visited. It is of great depth in proportion to its width, and winds and twists about in a most perplexing manner. A few miles above the canal the banks were scarcely 30 yards apart, and the trees in places actually met overhead in an arch. Of course, sails in such places were useless, and we were obliged to pole our way laboriously along. The stillness was intense—no sound of bird or beast disturbed the solemn silence of the solitudes. I do not think that we saw a single living creature all day, but slowly ascended in perfect silence. It was really awe-inspiring; we felt like explorers in an unknown land, and vague memories of Ponce de Leon were awakened as we cleaved the dark waters beneath the lowering arch of trees. Cypress, with hydra roots, rose from the black surface, like Dante's imaginations of a damned race, their contorted forms writhed like souls in agony. Long vines hung drooping from trees like serpents to stay approach to the recesses of the swamp. Slight, mysterious noises back in the dense woods made the silence all the more intense. All was somber, all was dark. The very sunlight was excluded for most of the day by the solid mass of foliage that made the river lie in one almost continuous shade.—*Forest and Stream.*

THE EARTH'S CLOUD BELTS.—We learn from the researches of M. Teisserenc de Bort that there is a marked tendency of the earth's cloudliness throughout the year to arrange itself in belts parallel to the equator. A belt of maximum cloudliness may be traced near the equator, two bands of light cloudliness extending from 15 to 35 degrees of latitude north and south, and two zones of greater cloudliness between 45 and 60 degrees, beyond which the sky seems to become clearer toward the poles. These zones toward the poles have a noticeable tendency to follow the sun in its change of declination, moving northward in spring and southward in autumn. The zones of clear sky correspond with regions of high pressure. The distribution of cloudliness, according to M. de Bort, is a direct consequence of the course of the wind.

SOLUBILITY OF SULPHUR IN ALCOHOL .—Mr. Arthur G. Bloxam, in the *Chemical News*, says: "The fact that sulphur crystallizes from its solution in hot alcohol in a white prismatic form has not, it appears, been generally noticed in text-books, for Miller's 'Inorganic Chemistry' is the only book at my disposal in which I can find it mentioned. This is the more surprising as it has become of considerable importance since the introduction of rubber corks. I discovered this fact for myself while separating some fat and sulphur with alcohol, being surprised at the deposition of white crystals from the hot solution. By dissolving sulphur in hot methylated spirit, and allowing it to cool slowly in a vessel surrounded by hot water, prisms of lengths up to one-half inch were obtained; they were brilliantly transparent, and so white that they might have been taken for crystals of niter, but they had become quite opaque and pale-yellow in the course of 36 hours, although kept under the liquid. A low power of the microscope showed very beautifully the change into octahedra. A more important bearing of the subject is in its relation to the use of rubber corks with alcohol. Mr. G. S. Johnson has called my attention to some crystals which he obtained in extracting a resinous body with alcohol, and which proved to be sulphur derived from the rubber cork connecting his flask and condenser. If a rubber cork be boiled with alcohol for 15 minutes, a good crop of sulphur crystals is obtained on cooling the liquid. It is evident that if alcohol be constantly distilled on to a rubber cork the resulting error will be still greater."

A "TOOTOMETER."—A Connecticut man has invented a device which he calls a "tootometer," by which the whistlings of engines are recorded. By it one may easily ascertain whether the engineer of a locomotive has sounded his whistle properly at the different crossings and localities along his run where the regulations require the same. Every irregular whistle is also recorded, as for cattle on the track, etc. The instrument is handed to the engineer, set for his trip, and when the trip is completed the record is read off at the office. Such a record is often important in case of a suit in court for damages, for not giving the usual warning by the whistle, etc.

FAILURE of the natural gas supply continues to be predicted, and, in fact, has been emphatically indicated in several places. The companies furnishing the gas in Pittsburg recently called upon the manufacturers to exchange their schedule of working hours so as to bring their heaviest work into the night, the reason being that the supply of gas in the daytime is not adequate. The workmen, however, refused to comply with the demand, and at one or more mills they have struck. Should the gas supply fail, resulting in the return of manufacturers to the use of coal, one element of "discrimination" in facilities at different manufacturing points would be removed.

IS IT MEERSCHAUM?—Some deposits have been found in the north of Ireland of a mineral almost pure white in color and of very light specific gravity, bearing a close resemblance to meerschaum. Some specimens have been submitted to a well-known pipe manufacturer, who says it is meerschaum but declines at present to give an opinion as to its commercial value, preferring to suspend his judgment until he has had an opportunity of seeing more of it and testing its suitability for the manufacture of pipes.

EFFECTS OF PRESSURE.—Lead in the form of filings, under a pressure of 2000 atmospheres, or 13 tons to the square inch, becomes compressed into a solid block, in which it is impossible to detect the slightest vestige of the original grains. Under the pressure of 5000 atmospheres it liquefies. Tin, when compressed in powder, becomes solid under a pressure of 10 tons on the square inch; zinc at 38 tons, antimony at 38 tons, aluminum at 38 tons, bismuth at 38 tons and copper at 33 tons.

CIVILIZATION IN CENTRAL AFRICA.—One of the discoveries recently made in Central Africa is a village of houses built along a street and having gabled roofs. The inhabitants are of superior order of intelligence, keep good order in the village and sleep on beds raised above the ground.

IMPROVED CARBONS.—Chas. Tappan has invented a liquid preparation which, it is said, on being applied to the carbons increases the intensity of a 2000-candle power arc light to a three-fold degree.

MAN has been alluded to as a walking coal mine, and it is for him to decide whether it will send forth heat and light, or only soot and smoke.

GOOD HEALTH.

Infant Mortality.

Dr. J. M. French contributes a paper on this subject to the *Popular Science Monthly* for December, which contains plain and practical suggestions as to the causes which destroy the lives of one-third of all the children before they reach the age of five years.

The subject has often been treated by scientists and physicians, and possibly much has been done among the better classes of society to remedy the evil in certain localities, but in general the percentage of infant mortality has not been materially reduced. Statistics show that in Norway the proportion of deaths is 204 5 per 1000 born; in England, 338 per 1000, and in Italy 507 (or nearly 60 per cent) per 1000. In 51 "healthy districts," so called, in England and Wales, it is stated, the average was 175 per 1000, while in the vicinity of Liverpool it was 460 in 1000.

In Vermont, in 1883, the average of deaths among 1000 children under five years of age was 23.8 per cent. For 12 years in Massachusetts, the mortality averaged 37.74 per cent, and in the city of New York, in seven years, it was exactly 50 per cent. Dr. Jacobi claims that more than half of those children who expire before they reach their sixth year die in the first year of their infancy. Statistics also verify the fact that the proportion of children who lose their lives in the cities before they are five years old is much greater than that of those born and reared in the rural districts. Dr. Curtiss estimates that "in all the great cities of North America, out of every 100 live-born children, about 25 die before the end of the first year, and from 40 to 50 before the close of the fifth year."

Dr. French enumerates at length the direct and indirect causes of this mortality as follows: Inheritance of defective constitutions and parental diseases; impoverished condition of the parents, combined with attendant ignorance, carelessness and inefficiency to properly provide for their offspring; exposure to cold and wet; excessive heat; improper feeding; filth, bad air, bad sewerage, etc., and overcrowding in tenements.

The list of diseases induced by these causes is very large, and includes infectious maladies, such as scarlet fever, diphtheria, etc., which afflict an average of from 15 to 20 per cent of those who die before their sixth birthday; acute lung diseases, with an average mortality of from 10 to 15 per cent., tubercular and constitutional diseases, as scrofula, consumption, etc., which as causes of infant death average from 10 to 15 per cent, and the diarrheal diseases, which remove about 25 per cent of children under five years old.

Dr. French's article is quite exhaustive and should be heeded by moralists, political economists, and especially by parents and those who contemplate marriage. The remedies for this great infant mortality are found largely in the removal of its causes by proper prevention and improved care and nursing.

MEDICAL HYPOCHONDRIACS.—The common people are not the only ones who become hypochondriacs. There are many practitioners in good standing who give way to the same phantasy. The St. Louis *Globe-Democrat* says: So many people are hypochondriacs that a physician expects to find one-third of his patients laboring under imaginary ills. It is easy for people to exaggerate symptoms, and, by giving themselves into the hands of quacks, become confirmed victims of ill health. What is not at all unusual is to find physicians who have become thoroughly hyped. Many of them with great reputations and very large practice and capable of diagnosing any case become cranks concerning their own health. They exaggerate the slightest symptoms into dangerous cases and believe they have chronic troubles when they would know that, in a patient, it would be but a slight indisposition. Most physicians are not competent to treat themselves, and many of them are confirmed hypochondriacs. Medical students begin early to imagine themselves afflicted with the various diseases they are studying. I remember I had a room-mate who became thoroughly hyped after entering the course. One day he caught a cold, and that night suddenly informed me he believed he was going to die, as he was certain that he was afflicted with a new malignant fever which we had been studying that day. I went immediately for one of the professors, and he not being in, I had another come. The second understood the case at once and gave my friend some simple remedy, and later the first came, and he, wishing to give the young man a lesson, had me administer a liberal dose of ipecac. This made him very sick, but cured him of the malignant fever.

MIND AND BODY SUFFER.—Probably there is no other class of people so peculiarly liable to dyspeptic troubles as Americans. They are notoriously erratic, not only in their habits of eating, but in other ways of living. They are always "on the jump." Personal convenience and welfare are among the minor considerations; there is always some other to take precedence. To acquire wealth is the one aim of many, but not all. Some have a noble purpose in life—to win in the art, the literary, the scientific, or the political world, places that cannot be easily filled when they are gone; but ambition is singularly the characteristic of all. None seem satisfied with the present; all cherish fond hopes of the future. Nor is this passion as a rule moderate in intensity, wisely regulated and limited to a healthy stimulus. Many feel its full tenacity and power, and all other promptings are held in check by it. Again, it is too often ill-directed, and when it is, mind and body inevitably suffer. In a word, Americans are a restless people, possessed by that constant and wearing anxiety to "better" their condition. The more they acquire, the more they want.—*Boston Herald.*

A MECHANICAL CURE FOR HICCOUGH.—Procure a glass of water and pour a little of it down the patient's throat. While he is drinking the water he should press a finger on the orifice of each ear. By this method you open the glottis, and in five seconds the thing is done. Should you by any chance meet with an obstinate case, you may rest assured that the throat and ears were not closed at one and the same time; either the water was swallowed before the ears were thoroughly stopped, or the water was not sufficient to fill the throat. Another precaution is to keep the chin well up. This cure was obtained by the writer from an old Indian medical officer who had experimented for some years to discover a method of relieving the terrible stage of hiccoughing in yellow fever, and this cure was the outcome.—*Pharmaceutical Journal.*

EFFECT OF THE IMAGINATION IN SICKNESS.—An instance has just occurred in Brooklyn, New York, to show the strong influence which the imagination has over a weak and sensitive mind. Jacob Hertline was bitten by a dog which he supposed had hydrophobia. He died of fright and nervousness, a medical examination proving there were no rabies in his case.

GUM-CHEWERS should take warning from the fate of a Newton, Conn., girl, aged 16. A piece of gum slipped down her throat, and, lodging at the entrance to the stomach, caused a fatal ulceration.

USEFUL INFORMATION.

FLINTLOCK GUNS—WHO USE THEM NOW?—It is difficult to believe, says the *St. James' Gazette*, that in these days of repeating and magazine rifles, when a flintlock gun or pistol commands a fair price as a curiosity, there should be actually existing in England a considerable industry in the manufacture of gun flints; and when we add to this a largish business in strike-a-lights or tinder-box flints, the fact is still more remarkable. The chief center, if not the only remaining center of this manufacture, is the picturesque little town of Brandon, in Suffolk, which has been engaged in this line of business from immemorial time. Not only did the chief supply of gun flints and tinder-box flints come from this spot during the long period when Englishmen lighted their candles and fought their battles with flint and steel, but long, very long before—before guns and candles and iron, and even bronze, were known to the inhabitants of these islands, Brandon was celebrated for its superior quality of flint, as it is to-day, and there is abundant evidence to show that from the prehistoric period down to the present day there has hardly been a break in the gathering and preparing flint for the wants of man at this spot. It will be, no doubt, asked who uses gun flints now? The answer is, the natives of Africa, to whom we have philanthropically traded our obsolete flintlock muskets and rifles, to enable them to kill each other—and occasionally ourselves—more commodiously. The fine flints quarried and shaped at Brandon are packed in kegs and exported to the various parts on the east and west coasts of Africa, whence they find their way into the interior for barter with the natives.

A PALACE OF SALT.—The people of Salt Lake City are contemplating the erection of a great "salt palace." It would be a structure that would lay in the shade all the ice and corn palaces ever constructed. The main part of the structure could be of the finest specimens of rock salt to be found in the quarries, chiseled, carved and artistically arranged, while the interior fittings should be of crystallized work from the lake on a grand scale. Such a palace should be permanent. If properly protected from the winter rains it could be made of the most unique and striking style of architecture; it could be made one of the wonders of the world. When lighted by electricity the structure would have all of the sparkle and diamond glitter of the great ice palaces, and with the difference in the salt palace's favor that heat would not melt or dim its glories in the least.

A NEW TOBACCO DISEASE.—A Constantinople journal states that the cultivation of tobacco is in danger of a disease hitherto unknown. The malady has appeared in Greece, in some plantations of the Phtiotide. The plants, appearing very healthy during the day, bend suddenly at night to the earth and the next day are dead.

AN ASBESTOS PIPE.—Another novelty is the asbestos pipe, the bowl of which is made of asbestos, and resembles a well-colored meerschaum in appearance; the mouthpiece upon being withdrawn from the stem reveals a spear of wire, which reaches to the bowl, having projecting barbs its full length. On these can be wrapped a little cotton, wool, or wadding, and so effectually catch and hold the nicotine. A company with $100,000 has been formed at Denver, Colorado, which will manufacture this pipe.

HOW TO SPLIT PAPER.—"Oh, dear! I have a picture printed on one side of this paper and some reading matter on the other, and I wanted to save both," said a young lady recently, who was pasting scraps into a book.

"Well, you can save both," said her friend.

"Why, how can I do that?"

"There are two ways of splitting a piece of paper. One is to lay the sheet of paper on a piece of glass, soak it thoroughly with water, and then press it smoothly all over the glass. With a little care the upper half of the sheet can be peeled off, leaving the under half on the glass. Let this dry and it will come off the glass very easily; of course the glass must be perfectly clean. The second way is a better one, but it requires some good practice. Paste a piece of cloth or strong paper on each side of the sheet to be split. When it is thoroughly dried, pull the two pieces of cloth apart suddenly and violently. The paste can then be softened with water and the two halves of the sheet easily taken off the cloths."—*N. Y. Mail and Express.*

EXTRACTION OF OIL FROM WOOD.—Referring to the extraction of oil from wood in Sweden, to which we directed attention some time ago, *La Nature*, in a recent issue, says that it is becoming, year by year, a more important industry. Those parts of the trees which have hitherto been regarded as useless, such as the stumps and roots, are no longer left in the forest to rot, but are subjected to various methods of treatment, by which not only wood oil, but also turpentine, creosote, acetic acid, charcoal and tar are obtained from them. The oil, as it is now usually extracted, cannot be burnt in ordinary lamps, for it smokes too much. But it may be used in special lamps, and when the oil is mixed with a certain quantity of photogen it may be consumed in ordinary lamps. It costs about 3d. per pint; it does not explode, and lasts 25 times longer than photogen. When intended for lighting it is extracted wholly from pines and firs. Thirty factories in Sweden are said to make its extraction part of their business, and the production is referred to as considerable.

MORE PIPE LINES.—A pipe line connecting St. Louis with the Lima, Ohio, and Pennsylvania oil-fields, via Chicago, is one of the probabilities of the ensuing 12 months. It is stated that the increasing consumption of fuel oils in St. Louis, through the introduction of improved oil-burners for furnaces, had decided the Standard to continue its pipe line from Chicago to St. Louis, and that the pipe will be laid next spring. For an oil pipe line the best wrought-iron pipe is used. It must be capable of resisting a pressure of 3000 pounds, as the oil is forced up long and steep grades. The size used in other pipe lines is eight inches in inside diameter. It costs about $1 per linear foot, or over $5000 per mile, and the cost of laying it is fully $1000 per mile.

AN ESTIMATE OF SOME INTEREST.—In order to give his hearers some idea as to how great a period of time 3600 years is—the time elapsed since the Egyptians lived whose mummied bodies are being found—the Rev. Chas. S. Robinson, whose lectures at the Madison-avenue Reformed church, New York, are proving so interesting, invited answers to this problem: "What would be the present value of a chain found about the neck of a mummied princess, at compound interest at 6 per cent, assuming the original value at $20?" The answer shows a row of some ninety figures.

A CEMENT CO.—Mr. Forrester, the cement expert, is confident of seeing a company incorporated at Salt Lake, as he has been able to satisfy parties with whom he has talked of his ability and experience in cement-making. Mr. Forrester has found all the ingredients necessary for manufacturing a first-class article of English cement between Ogden and Provo, after extended search. He is sure, because he has had chemical analysis made, and the ingredients are precisely the same as in the old country.

THE Professor of Geology in the University of West Virginia says that the rumors of failure of natural gas are idle and have no foundation, being set going by parties who wish to bear the natural-gas stocks. He insists that the production will largely increase for years to come.

THE WINE PRODUCT OF EUROPE.—The total amount of wine annually produced in Europe may be fairly estimated at about 2,752,000,000 gallons, which, at six bottles to the gallon, is 16,512,000,000 bottles, or about four dozen bottles of wine to each inhabitant of Europe.

A WALKING DAIRY.—Grass Valley has a walking dairy. A Chinese drives a cow from house to house and milks his customers' orders in plain sight. They get their milk straight and John gets the coin for each order.

ENGINEERING NOTES.

MR. KEITH ON ELECTRIC POWER.—A cotemporary, under this head, says: Prof. N. S. Keith, the well-known electrician of this city, has been in great demand of late by many persons who have required his advice in the matter of transmission of water-power by electricity for use in mines. Prof. Keith thinks that it will not be a very long time before many of the mines will abandon their present expensive methods of receiving power, chiefly from steam, and will utilize waterfalls not too far distant from the mines where dynamos will be located, from which will run wires to motors used for drilling, pumping, hoisting, hauling and crushing. The professor is still a warm advocate of the electric system of street cars, although the experiments made in this city, under his superintendence, were not entirely successful. On this subject he says: "Compare the loss in power absorbed by moving the cables alone in the cable-railway systems with the loss from resistance of electric conductors capable of performing the same service. Authorities state the cable losses at from 68 to 90 per cent of the total power. The losses due to dynamo, conductor and motor can easily be made less than 30 per cent. The loss from the cable is the same, whether one or many cars are to be moved. The loss when only one car is moved is almost 100 per cent. But with an equally long electric line, the loss with only one car on the line need not be two-horse power. Electric railways are being run all over this country and Europe. Crude in their beginnings, they are fast being improved."

RAILROAD ACROSS ASIA MINOR.—The consular reports lately issued by the English Government include a paper which presents some interesting details relative to the projected railway from Scutari, the Asiatic suburb of Constantinople, to Bagdad on the Tigris. In August last an imperial order was issued sanctioning the construction of the proposed line by a syndicate of English financiers. A French company, in favor of adopting a narrow-gauge system, also made a bid for the contract, but the Sultan decided for the British competitors and for a wide-gauge road. It is estimated that the line can be built at a cost of $77,500,000. Its length is 1400 miles, or more than 100 miles greater than that of all the present Turkish railway systems, European and Asiatic combined. Once in successful operation, the road will create a new Asia Minor, open to the trade of the world a vast territory now closed, totally change the character of the country, and practically advance Turkey in Asia from, say the sixteenth to the nineteenth century. Navigation from Bagdad, the terminus on the Tigris, to the Persian gulf, is easy. A new through highway to the East, independent of the Suez canal, will thus be open, which will bring Europe nine or ten days nearer to India than it is now.

AN ENGINEERING FEAT.—Quite a novel engineering feat was recently performed on the line of the Panama canal—nothing less than the lifting of a steam launch over a bridge, under which it could not pass. The Panama *Star and Herald* says: Another feat has been performed in connection with Panama canal work. This time it has been a peculiar one. The canal steam launch No. 16, of about 30 tons, was required to effect some work on the upper part of the canal. It would have required time and much expenditure to take her apart and to put her together again higher up. A powerful hoisting derrick called the "Ponton Bique" was called upon for its services, and it easily and fortunately lifted the steam launch over the bridge. This is the first time a canal steam launch has been lifted across a bridge in this manner, and we congratulate the American Contracting and Dredging Co. for the success which attended the difficult task they had undertaken to execute.

THE EIFFEL TOWER.—Notwithstanding all that has been said against the great Eiffel Tower at Paris, the work is being steadily carried forward. At last accounts it had reached a hight of over 600 feet some time in November. If the work is still going on (and we hear nothing to the contrary), it will reach the great elevation of 900 feet—within 100 feet of the original design—by the end of the year, and will be fully completed early in February. If completed, it may be well recognized as one of the wonders of the world. Meanwhile the decorative and accessory parts of the work are not neglected, and there is every prospect that the tower will be completed in all its details at the opening of the exhibition.

NEW DEVICE FOR UTILIZING WATER-POWER. A Russian engineer, M. Tayn, has invented a new means of utilizing a current of water. The apparatus consists of an endless cable, carrying a series of canvas cones which open and shut like an umbrella. The endless cable passes over a double drum on board a pontoon, and at the other end over a pulley suspended from a buoy. The current opening the cones on the rope moves the cable at a certain speed, and this drives a shaft or drum. On the upper part of the rope the cones are naturally closed by the current to which they present their points. This plan, it is suggested, would serve to raise a certain quantity of water for the purpose of irrigation.

Passing Events.

The greatest interest was manifested in the eclipse which occurred on Tuesday, and thousands of people witnessed the phenomenon. Many parties of scientific observers selected favorable stations, and all of them met with good success. The weather was clear at all points where parties with instruments were stationed, both in California and Nevada, and several hundred photographs were taken.

The find of a good vein of building slate in a tunnel being run in a gold mine in El Dorado county is a lucky one. There are already two slate quarries in that county, and this new vein will be developed at once. Good slate is scarce and is quite valuable.

The strike in the Harqua Hala mines, Centennial district, Arizona, is an important one. The ledge is very large and the carbonates are rich.

The first number of the PRESS for the year 1889 goes to our readers this week, and we hope they will oblige us by calling the attention of others to the merits of the publication and the advantage of subscribing to it.

The Solar Eclipse.

The Observations Generally Successful.

The brief reports made by the different parties in the field for observing the total solar eclipse of January 1st show that fine weather generally prevailed and good observations were made. We gave a list of these parties and their stations in the PRESS of last week. There were few places where clouds interfered with the views. The main interest of the observers seems to have centered in observations of the corona and study of the phenomenon. The exact periods of contact were noted by the scientific parties, but they, too, expended their best efforts in photographing, drawing or noting the corona. The party from the Lick Observatory made spectroscopic observations, and the result of their work will be looked for with interest.

The Lick Observatory Party.

At Bartlett Springs, Lake Co., the Lick Observatory party had made their rendezvous and were well satisfied with their choice. The sky was hazy, but the corona was beautifully distinct. Mr. Keeler saw remarkable changes in the coronal lines. Mr. Barnard obtained nine photographs with three different cameras. Hill got all the contacts and studied the structure of the inner corona. Leuschner made seven measures of the light during totality, and several drawings and paintings were made by others. Mr. Keeler informed a reporter that he was quite satisfied with the work accomplished, and that he had telegraphed Professor Holden at the Lick Observatory of the entire success of the expedition. He added that Mr. Barnard exposed his plates in regular order and the development only will reveal the exact nature of his success. Mr. Hill observed all the contacts, the times of which were recorded on the chronometer by Mrs. Hill. Mr. Leuschner obtained the photometric comparison assigned to him to his entire satisfaction.

At the Lick Observatory, Mt. Hamilton, the eclipse was observed successfully by Prof. Holden and Mr. Burnham. Thirteen photographs were taken.

Harvard University.

At Willows, Colusa county, was the Harvard University party. Prof. Pickering says: "It was perfectly clear here during totality, and the only failure I made was in catching the first contact. A cloud obscured our vision just as the moon entered upon the surface of the sun. The second and third observations were perfectly satisfactory. We took seven pictures with the 13-inch telescope, seven more with the eight-inch Bache, and one with the other eight-inch instrument. In all we have some 50 or 60 pictures. The majority of the plates will not be developed until we get back to Harvard. About 30 gentlemen from Willows and the vicinity were with us when we took the observations. I was very much surprised at the details of the corona. I expected they would be similar to the eclipse of 1878. It was rather lighter during totality than I expected to find it. The eclipse was without doubt the finest I have ever seen, and I am more than satisfied with the result of my observations. The Boyden 13-inch telescope, which was to be used in coronal photography, and was expected to give the finest representations of the corona in existence, was among the best of these instruments, while the eight-inch telescopes of fine power were also on hand to photograph the details of the outer corona. We had the largest photographic telescope in operation that has ever been trained on an eclipse of the sun, and we took altogether about 60 pictures—7 with the 13-inch instrument, 7 with one and one with another of the 8-inch telescopes, besides several with the spectroscope and many with other apparatus. There was just a little trouble with clouds at first, but on the whole I can state that California has done better for eclipse-observers than any country in which such phenomena have been scientifically regarded for many years."

Brown University and Amherst.

Prof. Winslow Repton of Brown University and A. Lawrence Rotch of the Blue Hill Observatory, near Boston, each well equipped for the work in hand, were also stationed at Willows, not far from the point of observation of the Harvard collegians.

At Marysville, P. W. Griffiths made several exposures of wet and dry plates, and these views will be sent to Amherst College. During the eclipse it was very cool, but immediately after it became much warmer. Several streaks of lightning were noticed at the Marysville Buttes during the time of totality.

Carleton College Party.

Chico, Butte county, was the location of a party of observers from Carleton College, Northfield, Minn., consisting of Professors Payne, Pearson and Wilson. The party used a six-inch photographic telescope and other photographic apparatus and a two-inch zenith telescope. Professors Wilson and Pearson exposed nine plates during the period of totality and six between the first and last contact. First contact, 12:24:20 o'clock, observed time; first contact, 12:24:35, computed time; second, computed time, 1:48:09; second, observed time, 1:48:19; third, computed time, 1:50:02; third, observed time, 1:50:14; fourth, computed time, 3.8:00; fourth, observed time, 3:7:56.

Sketches of the corona were made by Professors Wilson and Payne and Surveyor Brown. It was a most beautiful sight, though the sky was not perfectly clear. Four long streamers were seen. The northern and southern limbs of the sun showed a great variety of radiating filaments.

At Calistoga, Alexander Badlam and party had three telescopes, one of them a large one. Aside from the usual observations, this party took 71 photographs during the eclipse.

The Swift party from the Warner Observatory at Rochester was stationed near Norman, Colusa county.

The Normal School.

At San Jose (outside the line of totality) the Normal School observing party consisted of Profs. Kleeberger, Holway, and Randall, and the instruments were a four-inch refracting telescope and smoked glasses. At the time of the greatest obscuration "Bailey's Beads," the "Corona," and prominences were carefully looked for, but were rendered invisible by floating clouds and the unobscured portion of the sun. The effect of the eclipse on the color of the landscape was marked, and the intensity of light from the remaining portion of the sun was a source of surprise. Venus was plainly seen with the naked eye.

Among the phenomena observed was the effect of the eclipse upon images of the sun formed where its light shone through apertures. A beam of light showing through a crack in the shutter formed innumerable interlaced and overlapping crescent-shaped images of the sun.

University of the Pacific.

The University of the Pacific has a fine transit instrument and a six-inch refracting telescope in its observatory. Observations were made by Prof. Wilbur W. Thoburn, assisted by Prof. H. H. Briggs. During the first quarter of the eclipse the sky was obscured by clouds, but from that time on it was comparatively clear.

At Winnemucca, Nevada.

At Winnemucca, Nev., several parties were stationed. The individuals were: Prof. H. A. Howe of Denver, W. E. Elkin of Yale, T. D. Davidson of San Francisco, J. A. Brashear and Henry Phipps of Alleghany, Pa., E. P. Austin of Salt Lake, Colonel Maxson, United States Surveyor, E. M. Vanharlingen of Winnemucca, and T. G. Blinn and P. B. Glidden of East Oakland, all of whom, with the exception of Blinn and Glidden, acted in concert. The day was clear, not a cloud being above the horizon, and the scientists are enthusiastic in their praises of the Nevada atmosphere. The corona was not seen before totality, but two of the observers say they saw it 20 seconds after. Prof. Howe states that after the first contact the mountains of the moon were plainly visible and the definition was beautiful.

The general appearance of totality resembled that of 1878, but the extent of the corona was less by half. Several drawings of the corona made during totality have this same general appearance. No great protuberances were visible. Two were observed which seemed to be of a filamentary character, and great sheets of flame were seen to be distinctly separated from the main body, which was of a brilliant pinkish color.

Photographers took 12 negatives of the eclipse during totality. At the poles the streamers were radial, and as they started from points to the east and west of the poles they flowed off in tangential lines. Observers noted the direction of the motion of the shadow bands, which were about two inches wide. Alternately shadow and light sped along about eight feet per second.

The shadow was seen to move along slowly over the landscape like an immense cloud.

At Anderson Springs.

Miss Joey Anderson writes us from Anderson Springs that the eclipse, as viewed there, commenced at 12h. 21m.; totality commenced at 1h. 45m.; totality ended, 1h. 47 m.; eclipse ended, 3h. 11m.

No particular change was noticed in the atmosphere or landscape, only the shadows deepened shortly before totality—no ruddy or lurid glow seen. During totality only one star was visible, and that in the east. It did not become dark enough to require a light to see the face of the watch, although light was kept near at hand expecting that it would be needed. The return of the sunlight was startling in the extreme.

The Observations at Cloverdale.

There were several parties observing at Cloverdale, Sonoma county. The largest there and the largest in the field at any point where scientific observations were made, was that of the Pacific Amateur Photographic Association, operating under the direction of Mr. Charles Burckhalter, assistant in charge of the Chabot Observatory, Oakland. There were in all 68 members of this party, as follows:

Members of the association—A. J. Treat, S. C. Passavant, Chas. Burckhalter, O. V. Lange, Chas. G. Yale (of the MINING AND SCIENTIFIC PRESS), P. Carleton, C. F. Montealegre, J. W. Stanford, J. V. A. Rey, Eugene Frost, Samuel C. Partridge, W. C. Gibbs, George W. Dornin, William Letts Oliver, J. H. Johnson, E. W. Runyon, A. P Redington, W. H. Chapman, W. H. Lowden, E. L. Woods, George Tasheira, F. H. McConnell, George W. Reed, C. L. Goddard, W. S. Davis.

Assistants—Alpheus Bull Jr., Harry T. Compton, Marsden Campbell, C. P. Grinwood, George H. Strong (of the MINING AND SCIENTIFIC PRESS), William F. Booth, W. B Ewer (of the MINING AND SCIENTIFIC PRESS), and Lew Tasheira.

Recorders—H. W. Schwerin, William N. McCarthy, W. C. Edes, Alfred K. Gibbs, M. P. Donnelly, F. C. de Long, George A. Story, J. A. Bauer, E S. Gray, E. B. Moore, George B. Baer, Walter Henry, M. Seligson, E. P. Livingston, F. S. Wright, C. W. Wilkinson, Harry Phelan, Moses Callan. Thomas Andrews, Mrs. C. L. Goddard, Miss Hermione Rey, Mrs. E. S. Gray, Mrs. Geo. Tasheira.

Sketchers—Mrs. George Roe, Miss Silvia Rey, Miss Truesdell, Miss Treat, Colonel C. Mason Kinne, Captain W. B. Hooper.

The following professional and amateur photographers not connected with the association were also present: I. W. Taber, A. C. Burnham, W. B. Tyler, Seth C. Jones, Louis de F. Bartlett, Bert Remmel.

The geographical position of this station was found by Mr. Compton to be latitude 38° 47′ 30″; longitude 122° 57′ and 25″. During the morning several drills were gone through so that the observers would have some practice and be enabled to carry out instructions properly.

There were 30 cameras in the two rows, and on each side of these were several telescopes. Some of the larger cameras were also provided with telescopes as finders. An allotment had been made by the committee for each of the photographers, in order that a great variety of exposure of plates would be insured. Some of them were to make exposures of half a second, while others exposed their plates over 40 seconds. Some used slow plates with long exposures, and some, rapid plates with quick exposures. Each knew exactly what was expected of him and carried out instructions to the letter.

Counting Time.

In order that there should be uniformity with regard to time, and each should know exactly the period at which the different plates were exposed and the time of exposure, a very good arrangement was devised by Mr. Burckhalter. A battery and telegraphic sounder were connected with a sidereal chronometer so that the beats of the seconds were sounded. About one minute before totality, Mr. Alpheus Bull, Jr. began counting aloud, so all could hear distinctly, he taking the time from the sounder. An observer was in the mean time carefully observing for the instant of totality through a telescope. This preliminary counting was done to determine how long before totality any observer could notice the corona, and each one noted on a prepared card when he saw it. As totality commenced, Mr. Compton, another observer, called "time," and immediately Mr. George Strong of the MINING AND SCIENTIFIC PRESS commenced counting aloud, taking the sounder as his guide. The work of the photographers then began and continued until the last instant of totality was called, when Mr. Strong ceased counting and Mr. Bull again commenced counting till he had counted 50.

The counting after totality was so that the length of time the corona could be noticed could be recorded. The object of having two men to call was that voices of different tones could be recognized as marking the periods o before and after totality and during tota phase. Each photographer had an assistan

and each assistant had a card devised by W. H. Lowden, on which was printed a row of figures from 1 up to 200. His instructions were to indicate on this card the exact second of totality at which the lens of the camera was removed and again when replaced, and repeat this as many times as there were plates exposed. This card then furnished a record not only of the time of exposure of each plate, but the period during totality the exposure was made. The assistant had but to listen to the voice of Mr. Strong, who was calling, and mark on the card the number being called, as the lens was uncapped and capped. This arrangement proved perfect, as in every case the time and period of exposure of every plate is known, and all were working on the same time by chronometer. For scientific purposes, the knowledge that any given negative was made in a certain number of seconds is of great importance as a guide for further work of this kind.

Actinic Strength of the Light.

D:. S. C. Passavant of this city took with him a Warneroke sensitometer for the purpose of testing the actinic strength of the light of the corona. He reports that an exposure was made by his assistant, Thomas Andrews, to an H. L. plate, which registers 15 on the sensitometer by the ordinary tests. This exposure lasted 15 seconds, commencing at 41 seconds after totality and ending at 56 It is hoped that this will be a valuable test for future work of this kind, as the sensitometer will register the exact strength of the light, as compared with that of the sun, and enable photographers on similar occasions hereafter to expose their plates with a greater degree of certainty than is possible at the present day.

A portion of the same plate on which this exposure was made will be tested in the ordinary manner and developed at the same time, while still another portion will be exposed for 15 seconds only. By this means the exact value of the corona light should be obtained.

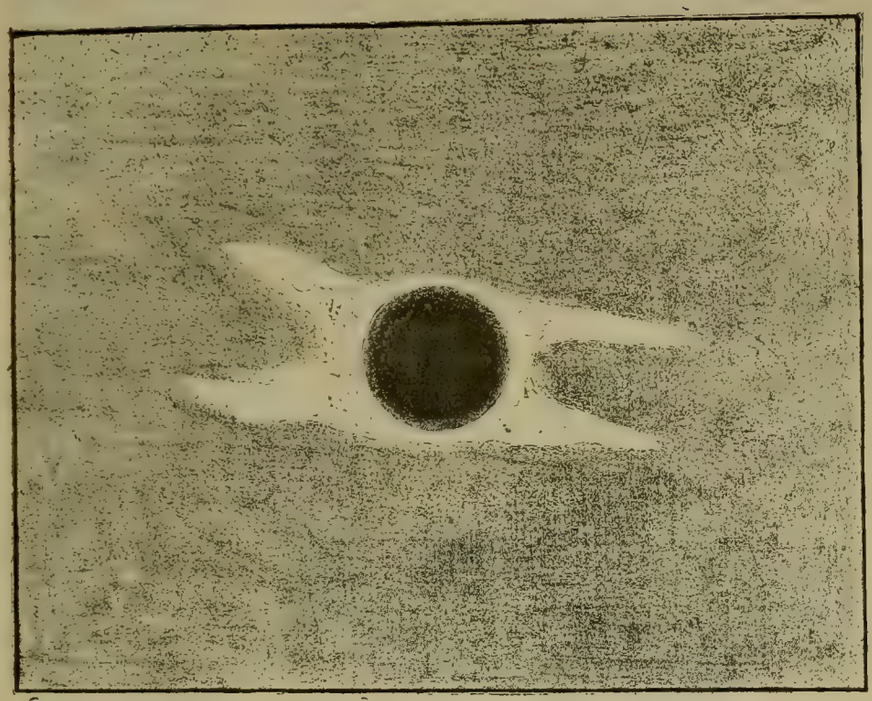
The party paid little attention to the contacts, the intention being to observe mainly for corona and sun flames. Cards were prepared having a central black disk, so that each observer could draw the corona as it appeared to him. There was a great similarity in all the drawings, the only difference being in the length of the rays. The ladies making sketches and who are skillful colorers, were instructed to protect their eyes preceding the total phase, so that the eyes would be color-sensitive. They describe the color of the sky before totality as being a leaden blue. It became brighter and more luminous during totality as it extended up to the corona. The light near the disk of the moon was an intense luminous silver, with a bluish tint similar to the light of an electric arc. The outer corona was similar in color, though fainter, fading away into the surrounding sky. The disk of the moon appeared of a gaseous aspect and of a dark, hazy, purple color. At no time did it appear black. The streamers, which extended in an oblique direction, were of the same color as the outer corona. Warm colored or red rays were not observed by those who had made their eyes sensitive by protection previous to totality. One of the cuts on this page is from a colored drawing made by Mrs. Laura B Roe. The colors are so delicate that it is difficult to reproduce in black and white the rays as she drew them. The reproduction shows the corona more extended than the original drawing.

One of the best drawings was that made by C. Mason Kinne of the San Francisco Microscopical Society, and this we reproduce. He used a low objective and saw the color of the inner corona, or photosphere, as a cold, steely blue, fading into purple red and slight yellow, being first chemical heat and finally color rays. He also observed a slight protuberance on the northwest periphery.

The extended rays were about two decimeter of the sun. No color was seen except in the photosphere, as described. The corona belongs to the sun, but the radiation of light beyond the sun he thinks is the refraction of light on the cosmic dust permeating the whole universe.

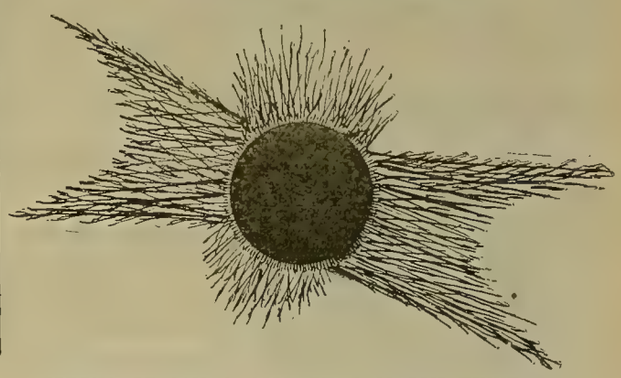
Captain C. L. Hooper of the United States

CORONA OF 1870.

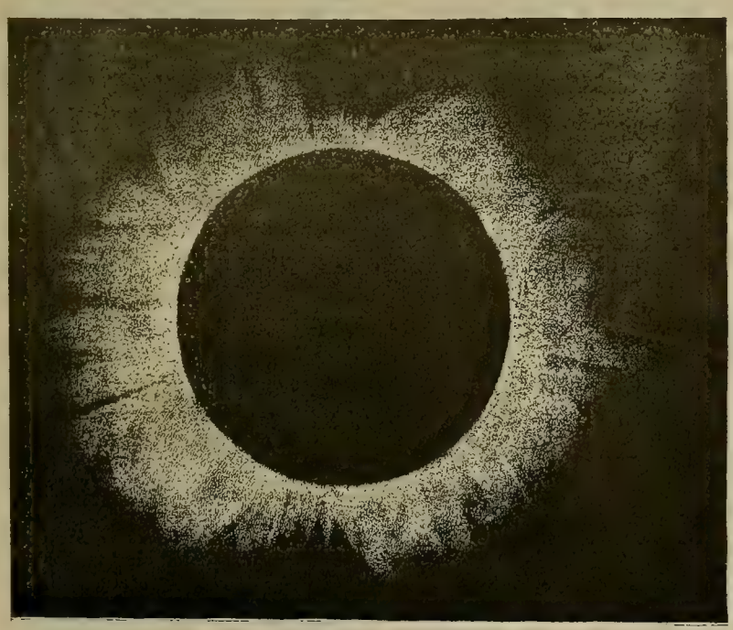


THE CORONA OF JAN. 1, 1889, FROM A COLORED DRAWING.

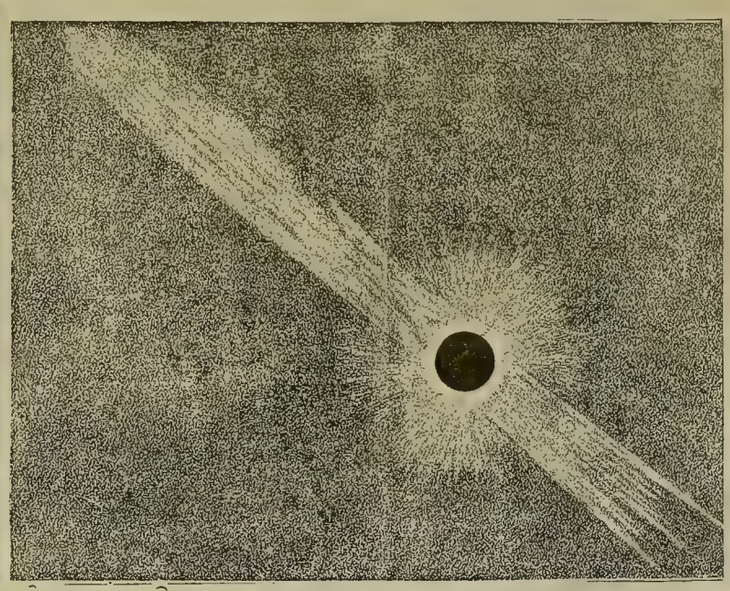
OUTER CORONA OF 1869.



CORONA OF JAN. 1, 1889, BY C. MASON KINNE.



CORONA OF 1871.



OUTER CORONA OF 1878.

revenue cutter Corwin was with Colonel J. M. Donahue's party accompanying the photographers. He had a 2½ inch telescope, but noticed no color at all in the corona. It was a swallow-tail shape and expanded about one degree on each side, as nearly as he could judge, in the direction of the ecliptic. No signs of protuberances or flames were noticed. The light appeared like that from a shaded electric light.

We give some other engravings also showing the corona as seen at previous eclipses. These are from Prof. Todd's pamphlet. One shows the outer corona of 1869, another the corona of 1870, and another that of 1871.

The Total Phase.

The arrangements for complete silence during the period of counting aloud came near being spoiled by the very unexpected shrieking of locomotive whistles at the adjacent station during the total phase, and the callers had to shout to be heard. But though annoyed, the observers had been so well drilled in the morning that they went steadily on with their work. The period of totality was 104 seconds, during which time 164 negatives were made. Some of these have since been developed and show very good results. The sky was perfectly clear during totality, though there were a few clouds both before and after. One large cloud below the moon was beautifully illumined with prismatic colors just before totality, and this was the most picturesque part of the eclipse to many who witnessed it.

Meteorological Observations.

The meteorological observations were made by W. B. Ewer of the MINING AND SCIENTIFIC PRESS with instruments furnished by Melville Attwood and the Chabot Observatory. The wind was so slight that the anemometer scarcely recorded it. The black-bulb thermometer, exposed to the sun, recorded 69⅞ at 12:35, 62 at 1 P. M., 61 at 1:15, 52 at 1:35, 46 at 1:45, and 42 during the totality. The dry-bulb thermometer registered 55½ at 12:35, 54 at 12:50, 55½ at 1:07, 54 at 1:25, 57 at 1:40, and 51 during total phase. The wet-bulb thermometer ran down from 51½ to 49, the latter figure during totality. The barometer dropped five hundredths during the total phase, quickly returning to normal figures on its conclusion.

The Cameras.

The largest camera was that of Mr. Burckhalter, who had for the time being converted his Newtonian reflecting 10½-inch telescope into a telescopic camera mounted in a wooden tube eight feet six inches long. The minor axis of the diagonal mirror was 3½ inches; focal length, 84 inches. The diameter of the image in this camera was 13-16 of an inch, the field being about 4½ degrees. In this camera ten plates were exposed, varying from half a second to ten seconds. The plates used were Passavant's "C. I. P." and "H. L," with a respective sensitometer register of 22 and 15. The camera was arranged with alt-azimuth mounting, the motion being controlled by Mr. Yale of the MINING AND SCIENTIFIC PRESS, who assisted Mr. Burckhalter. Mr. Will Booth recorded and Mr. Marden Campbell uncapped and capped lens, while Mr. Burckhalter himself attended to the exposure of the plates.

The camera of W. H. Lowden had a Beck lens, 22-inch focus and 11x14 plates. It was mounted for altitude and azimuth, and slow plates made from a special emulsion by Dr. Passavant were used. One plate was exposed 41 seconds and the other 28 seconds. These long exposures were purposely made in order to obtain details of the corona and perhaps detect an intra-mercurial planet. If any negative shows, that one of Mr. Lowden's must do it.

W. O. Gibbs used a camera recently patented by himself through the MINING AND SCIENTIFIC PRESS Patent Agency. The plate was 5x7; single landscape lens; 22-inch focus. He exposed two slow and two fast plates. Mr. Gibbs was the first one of the party who saw the corona.

Mr. W. Letts Oliver exposed six plates, some slow and some rapid. He used a half-plate camera, single-view lens, 32-inch focus. He made two negatives before totality and one of the rainbow in the clouds.

O. V. Lange exposed one of his plates one-quarter second and none of them more than four. Some since developed showed excellent results.

Mr. I. W. Taber had two cameras, one of them the largest regular camera in the field. He was very fully equipped and with his professional experience must have made some successful negatives. His assistant, Mr. Burnham, made several views of the station while all the instruments and observers were in position.

Both Mr. Burckhalter, director of the party, and Mr. Treat, president of the association, expressed themselves greatly pleased at the manner the work was done by observers and assistants. There was no hitch of any kind, everything being done according to program. Clock signals were sent by the Lick Observatory, so the time is accurate.

It was not as dark as was expected during totality, though the chickens in neighboring yards went to roost. None of this party observed rose-colored sun flames. The corona was brighter than expected, but with less color.

The negatives, drawings and written observations of this party will finally be transmitted to the Lick Observatory, where they will form part of the permanent scientific records of the eclipse.

Shortly after the ending of totality all the suppressed excitement of those present broke out, and enthusiastic cheers were given for the Chabot Observatory, the Amateur Photographers' Association and Mr. Burckhalter, who directed all the work. All were satisfied that the long-prepared arrangements had worked perfectly.

Similar demonstrations occurred with the other parties, the Eastern observers particularly congratulating themselves on the clearness of the California atmosphere and the success of their expeditions.

We shall be able to give fuller details of results after the negatives have all been developed, and the recorded observations written out.

Coast Industrial Notes.

THE following officers were recently elected by the Longshore Lumbermen's Protective Association: President, Robert Hamilton; Vice-President, Michael Ford; Recording Secretary, Laurence Buckley; Financial Secretary, H. P. Wynn; Treasurer, August Pearson; Board of Trustees, Philip Ermoth, John T. Anderson, John Sullivan, William Grodt, Isaac Baker; Sergeant-at-Arms, Edward Austin.

A PLANING MILL is being built at Ellensburg, Washington Territory. The latest and most improved machinery, to be driven by a 48 horse power engine, will be placed in the building. In connection with the main building there will be a large warehouse, lumber shed and drying-room, and all kinds of building material will be kept on hand. Doors, sash, flooring and ornamental work will also be a special feature. The firm have expended during the past year over $12,000 for material purchased abroad which should have been produced in Ellensburg. They expect to give employment to 30 or 40 men in their new mills, and will also employ a large number of carpenters. Their increasing business has made necessary the erection of this mill, and contracts enough are already in sight for next year to justify the enterprise.

THE erection of a plant capable of crushing 300 to 400 tons of porphyry a day for use in San Diego street-paving is contemplated. This enterprise is the outcome of a discovery of a fine grade of porphyry rock in the Sweetwater valley. W. J. Holmes of San Diego is at the head of the scheme. The erection of the plant will cost about $15,000 and would afford employment for a large force of men. The rock, which is of superior quality, can be delivered in San Diego for less than $1.50 a ton.

THE powder-mills people report the manufacture of unusually large quantities of high explosives of late. The Donahue Railroad Company has used immense quantities, as have the Southern Pacific and the miners in various parts of the coast.

THE advanced railroad rates of manufactured iron is playing into the hands of our iron works people. If the new rates are continued for any length of time they will result in the increase of home manufacture of many articles now largely brought here by rail from Pittsburg and other Eastern cities.

THE *Alaskan* says: It is very likely that two new canneries will be erected in Sitka next season. One is to be put up by Lynde & Hough, who have formed a partnership with John L. Carlson and Foard & Stokes; and the Kinney Packing Co., with Mr. Bell of Astoria, Oregon, as superintendent, intends erecting the other. Mr. Bell says he believes that the increase next year in the number of cases of canned salmon turned out in Alaska over the present will be full 200,000, an advance of over 45 per cent.

THE Moodyville mill at Burrard inlet has been closed for a few days for an extensive overhauling and repairs. The opportunity will be availed of to put in some new machinery.

AMONG other things, two bills were proposed at a recent meeting of the Council of Federated Trades, one of which was to provide for proper sanitary measures for employes working in factories, and the other to insure the safety of employes from machinery and elevators. Officers were nominated to be elected at the next meeting. The delegate from the Musicians' Union reported that his union had revised the schedule of prices. The only change made was in the price of church music, which was reduced. Assemblyman Simpson appeared before the Council and requested their support to a bill which he proposed to introduce in the next Legislature, to regulate the rate of wages of the employes on Government contract work. The matter was taken under consideration.

THE following bill will be introduced in the Legislature by Labor Commissioner Tobin. It is entitled "An Act Concerning Child Labor": Section 1. No male under the age of sixteen years, nor any woman under the age of eighteen years, shall be employed at labor in any manufacturing establishment in this State for a longer period than sixty hours a week. Sec. 2. No child under thirteen years of age shall be employed by any person, firm or corporation, and every minor under sixteen years of age, when so employed, shall be recorded by name in a book kept for the purpose, and a certificate, duly verified by its parent, or guardian, or if the child shall have no parent or guardian then such certificate, stating age and place of birth of such child, shall be kept on file by the employer, which book and which certificate shall be produced by him or his agent at the requirement of any official duly authorized by law to make such requirement. Sec. 3. Every person, firm or corporation employing women under eighteen years of age or minors under sixteen years of age in any manufacturing establishment shall post and keep posted in a conspicuous place in every room where such help is employed a printed notice stating the number of hours per day for each day of the week required of such persons, and in every room where children under sixteen years of age are employed, a list of their names with ages. Sec. 4. Any person who knowingly violates or omits to comply with any of the foregoing provisions of this Act, or who knowingly employs or suffers or permits any child to be employed in violation of its provisions, shall, on conviction, be punished by a fine of not less than $50 or more than $100, and in default of payment of such fine, by imprisonment for not less than thirty days nor more than ninety days for each. Sec. 5. This Act to go into effect and force upon passage.

BIDS for work on the McDonough building on the corner of Fifteenth and Broadway, Oakland, were opened, and contracts on them were awarded as follows: For iron work, Judson Iron Works, $5124 90; brick work and excavating, V. L. Fortin, $15,272; stone work, F. E. Knowles, $1575.

THE annual report of the Oregon State Fish Commissioners sets forth that the law governing salmon fishing is generally obeyed, and that the establishment of more hatcheries would increase the number of salmon and end the difficulty between the fishermen and canners about prices. It recommends the remedying of the law so as to prohibit salmon being handled in the close season, and to prohibit the practice of taking fish near spawning-grounds; also the offering of bounty for sea-lions and other salmon destroyers, and the extension of the opening of the season to April 15th. It is the belief of the Commissioners that the present fine of $500 or one year in prison for the violation of the law is excessive.

THE Mendocino *Dispatch-Democrat* says: H. T. Hatch's new sawmill is nearing completion, and will soon be inclosed and ready for work. The building will be 36x120, with the ell 36x60. The machinery is all up, and the lumber for the building is now being sawed and put together as rapidly as possible. The engine is an 85 horse power and the capacity of the mill will be 46,000 feet daily.

DELEGATE BROWN of the Stevedores' Protective Union says that work on the city front is very slack at present. If a man earns $12 a week he is doing very well indeed. The principal trouble experienced is from the men who withdrew from the union. These men are going around the water front offering to work for 50 cents an hour, while the union men will not work for less than 55 cents. The Riggers and Stevedores' Union, he adds, also cause a good deal of trouble on the front. They do all they can against the Stevedores' Protective Union, even going so far as to impose a $5 fine on any of their foremen who employ a member of the latter organization, no matter how scarce men may be.

THE Hanford *Sentinel* says the fish sent by express from L moore from September 15 to December 1, 1888, were 60,565 pounds. It will be seen that the combined fish product shipped from Lemoore and Hanford, all from Tulare Lake, amounts to 133,620 pounds, or about 66½ tons in two and one-half months. These fisheries will continue through the winter until the summer season forbids.

ALLEN TOWLE was talking the other day of the fine water-power to be had on the Bear river canal just above Auburn, Placer Co. He has made a personal examination of the facilities there, and says that several hundred horse-power may be had so easily that he wonders that some enterprising manufacturer has not long ago made use of it. Mr. Towle thinks it is one of the best chances in the country, located as it is close by the railroad.

THE Board of Harbor Commissioners has determined to give the various processes for destroying the teredo a test on the new Beale-street wharf.

IN the San Jose and Santa Clara electric railroad the conducting wires of insulation are in a concrete-imbedded conduit, 8x15 inches in size, which is immediately beneath the center of the roadbed. The opening to the conduit is a three-quarter inch slot in the center of the track, through which the insulated wire connects the dynamo with the motor attached to the car's axle. There are now in San Jose 14 miles of this wire conductor in operation, equal to seven miles of track, and when the work in hand is completed there will be 20 miles of conductors, or ten miles of track, which will be the most extensive electric railway system in the world. When finished the system will have cost between $450,000 and $500,000.

COTTON AND WOOL.

The Cotton Crop and its Movement.

Reports indicate a very large movement of cotton to Europe this year. Up to September 30th, 3,055 000 000 pounds had gone forward against 2 932,000,000 taken in 1886–87, and 2,847,000,000 in 1885–86. For the three months ending November 30th, the northern mills took 43,000 bales less than for the corresponding period in 1887. It seems now a pretty well-settled fact that the quality of this season's cotton crop is inferior to that of last year. The wet weather of September was particularly hard on the sightliness of the cotton in the boll, and stained cotton is sure to be found in abundance in the market for the rest of the season. The quantity is still a subject for shrewd guessing, but the indications are favorable for a final crop of 7,000,000 bales. The yield per acre is said to be the same as last year, that is, 173 pounds, net, of lint. No system of improved cultivation has yet been devised to increase this yield in an average of years.

According to Ellison's annual review, the world's consumption of cotton is thought to have increased 46 per cent, but this statement is questioned in other quarters. Ten years ago the consumption of Great Britain was 60,000 bales a week; of the continent, 50,000 bales a week, and of the United States 30,000 bales, in all 140,000 bales, according to Mr. Ellison's own figures. For the last year, the aggregate consumption may be approximately estimated at 195,000 bales a week, thus indicating an increase of 25 per cent instead of 46.

Even the corrected figures show a very considerable increase and are quite sufficient to force a promotion of cotton culture in countries where it now receives but little attention. Thus far but little gain has been made during the last 15 years, outside of the United States. Experiments in India and Egypt have not been very successful. The most promising field, for new effort, just now appears to be south-western Russia in Asia, which is represented to be peculiarly adapted to such culture. It is not to be presumed, says the Boston *Journal of Commerce*, that the United States has reached its maximum production of cotton, yet it is an opportune question whether it will not soon become necessary for spinners to look more to other cotton-growing countries for additional supply. It is not so much a question of the cotton-growing capacity of the Southern States as it is a question of agricultural economy, whether to consider cotton culture other than an auxiliary in general husbandry. For the finest counts of yarn, the American varieties will always be held in preference, for any considerable quantity, but for ordinary counts other cottons can be used, alone or in mixtures. South America and Asiatic countries have not yet shown what they can do under a well-conducted system of cultivation. The United States need stand in no fear of competition from other regions of the world; it will be only when this country is unable to meet the demands of manufacturing that attention will be directed elsewhere.

The World's Cotton Manufactures.

Mr. Ellison estimates that there were 82,135,000 spindles at work in the world last year, compared to 81,840,000 the year previous. He allows for an increase of 200,000 in Europe, 25,000 in the United States, and 70,000 in the East Indies.

In 1883 the foregoing countries were estimated to have 78,950,000 spindles, showing an increase in the past five years of over four per cent. The consumption of cotton in 1883 was calculated at 9,684,000 bales, showing an increase of a little over 2 7 per cent in five years. For this period the consumption per spindle has fallen behind, according to these figures, though it should be remembered that the consumption was unusually large in 1883 throughout Europe and the United States.

Cotton-Mills in Greece.

Piræus, the ancient harbor of Athens, has, in the course of a few years, risen from the state of an insignificant port of transit to the rank of an industrial town with 30,000 inhabitants. There are at present eight cotton-spinning mills with 36,000 spindles, four textile factories with dyehouses attached, eight grist-mills, etc., in operation. Besides, there are scattered throughout Greece 15 or 20 mills with 80,000 spindles, and four linen factories, which produce daily 1000 pieces of linen. At the places where silk is raised, there are also silk-mills. Since 50 years, the manufacture of fakuels—that is, printed kerchiefs, which are worn by Oriental women wound about their hair in exquisite taste—has become a special industry, in which a factory at Lysa employs steam-power and 150 workmen, producing 1000 a day.

Cotton Manufactures in China.

Cotton manufacturing is finding an existence in the Empire of China, especially in Shanghai. The beginning of the enterprise was the introduction of a number of Japanese cotton gins so arranged as to be run by belt-power from a steam engine. Recent advices from Shanghai to the Boston *Journal of Commerce* are to the effect that the Chinese cotton merchants of the place have petitioned the authorities adversely to the further prosecution of the cotton-spinning company's operations, which are now con-

fined to cleansing the raw material and placing it upon the market. The object of the company is to spin and weave the cotton which it gins, but which has not yet been attained beyond the preliminary steps. The objection entertained by the petitioners toward the company is because of the latter's practice of putting its ginned cotton upon the market in competition and to the prejudice of the business of the cotton merchants who deal only in hand-cleaned cotton. The authorities are evidently not in sympathy with the purposes of the petitioners, as the amount of cotton annually cleansed by the company with its machinery is only a very small portion of the hand-cleaned cotton marketed in Shanghai. Besides, the "superiority of machinery over handwork, which it illustrates, cannot but tend to the advantage of commerce." The authorities are not slow in condemning the petition as exhibiting a disposition to obtain an improper monopoly and undue control of the cotton business. The company, at present, is simply utilizing its ginning machinery till its plant is completed for spinning and weaving.

THE IMPORTS OF WOOL for the first nine months of the present year are about the same, in amount, as for the corresponding time last year, that is, 73,907,515 pounds against 77,085,506 pounds. There was an increase in the amount of clothing wools, but a marked decrease in that of combing wools. About an eighth part of the clothing-wool imports was forwarded to Canadian mills. There was 15 per cent more yards imported of women's and children's dress goods than for the corresponding nine months in 1887.

THE WOODLAND WOOLEN-MILLS turn out 1000 yards of flannel a day. They have begun to make blankets, and when in full running order they intend to turn out 200 a day.

IT is now almost assured that the Australasian wool clip of this season is superior in quality and larger in quantity than that of last year.

Flour Mill Notes.

Wheat and Flour in France.

The large falling off in this year's wheat crop in France is causing much discussion in that country. The acreage of wheat sown there for 1888 exceeded that of 1887 by 2.3 per cent; but the yield was less by 21 per cent, leaving an aggregate deficiency of over 80,000,000 bushels, which must be obtained from foreign countries. In 1887 the United States exported to France only 19,500,000 bushels. What proportion of the 80,000,000 will be made up by this country is a matter of no little interest, and will depend largely on what course the French Government takes in regard to the very heavy import duty on wheat which is now 26⅔ cents per bushel, and the selling price has advanced fully 15 cents on the bushel. There is an earnest demand for a material decrease in this duty, made by the great industrial classes, by the many who are non-protectionists from principle and from the commercial men who are engaged in the wheat-importing business. The question as to what the Government should do to mitigate the effects of the unfortunate harvest upon the poor wage-workers is just now the foremost political topic of the country, or at least it was so previous to the great Panama canal collapse, which adds still further to the critical condition of the working classes. The opposition to reducing the import duty comes from the theoretical protectionists, who dread to see any backward step in tariff legislation, and from those who are largely engaged in wheat-raising on French soil. The indications are, however, that the present import duties will be strictly adhered to, in which case people will economize and retrench on that class of diet, whereby the extra demand for the foreign product will be materially lessened. Under all these circumstances, it is but reasonable to look for a decided increase in the demand for American wheat in France during the coming year.

The Flour Question in Portugal.

The King of Portugal, in view of the increase in the cost of flour, has already issued a decree reducing the duty on imported wheat. This was avowedly done to favor the working classes. With the exception of Russia, all the laboring classes of Europe seem destined to suffer more or less from the shortness of the European product, and the consequent advance in the staff of life.

THE VISALIA FLOUR-MILL, owned by Messrs. Fox & Williams, which was totally destroyed by fire Nov. 9th, was a severe loss, as it was insured for much less than half its value. Within a year many improvements had been made in the mill, it having within that time been converted from the old burr process to a modern roller-mill, at an expense of about $20,000. The warehouse was filled with flour, barley, wheat and corn. The Tulare *Times* in alluding to the disaster says that the mill received patronage from the uttermost bounds of the county, and as many as 20 teams have been seen in camp near there at one time, waiting for their grist. It brought an immense patronage to our business men, and they cannot afford to do without it. The mill was an old structure, the brick building having been constructed in 1858. Previous to that date, however, in 1854, Dr. R. R. Matthews and his brother Warren had erected a two-story frame building for a mill just north of the brick building. The original mill was constructed of oak lumber, the heavier timbers being hewed from oak trees which grew near the site, while the oak lumber was sawed at a mill then being operated about seven miles east of this city.

Shop Notes.

CHANGING LUBRICATING OILS.—It is a mystery that men who are called upon to use lubricating oils—that is, to do the work of using them, and the work resulting from their use—can never understand why, when an oil has been found just right for the purpose for which it is intended, a change is made by those who control the purchasing power. Valuable machinery is often sadly damaged by such changes. The highest priced oil is not always the best, but the best of common oils is generally the cheapest. When a large quantity of machinery is operated, the quality of the oil used often has an important bearing on the amount of coal burned, and sometimes the rapid destruction of delicate machinery more than overbalances the cost of both coal and oil. The reason, sometimes, why a change of oil is made when the quality is in every way satisfactory, is that the new "oil man" has an insinuating way with him, that captivates the purchaser, and sometimes, alas! the purchasing agent is captured by other means. There are reputable dealers in oils, who, a quality having by experiment been found that is best for the purpose, undertake to furnish it of a standard grade as long as desired. Lubricating oils are, at the present day, very commonly a compound of animal and mineral oils, and vary quite widely as compounded for different purposes. Many dealers have been to considerable trouble and expense in getting at the best mixtures, and can frequently give good advice when the purpose for which the oil is to be used is known to them.—*Am. Machinist.*

THE BURSTING STRAIN OF REVOLVING WHEELS.—A correspondent of the *American Machinist* gives the following simple rule for determining the bursting strain of revolving-wheels. Though the rule may not be absolutely exact, it gives results near enough for practical purposes by the use of a very few figures: The strain per square inch of pulley-rim section is one-tenth of the square of velocity in feet per second, nearly. As determined by Mr. Porter's formula, the strain due to running a 20-foot wheel 100 revolutions per minute = 1085 pounds per square inch, and by the above rule ($V^2 .10$) the strain figures 1096 pounds per square inch of section. A five-foot wheel, at 200 revolutions, has, by Mr. Porter's rule, a strain of say 271 pounds per square inch, and by rule above given about 273 pounds—a difference too slight to quarrel over, considering the fluctuation in strength in different castings, or even in different parts of the same casting. Knowing the belt speed, it is, in many cases, quite possible to determine the strain by "mental 'rithmetic." The constant .1 has been taken instead of that actually due to cast iron, as it allows us to point off one figure at the right of the V^2 value, instead of making the usual division.

A GRAVE ERROR is often made by many firms in not keeping their apprentices after they have become journeymen in preference to hiring new men. A firm will hire a boy to learn the trade and increase his pay as agreed in the contract made when the boy commences, and then let him go rather than pay him journeymen's wages, even if in need of help at the time, and hire another man in his place who is not acquainted with the shop or office, whichever it may be, and pay him the wages that the former apprentice has to seek in another place. As a rule, the young journeyman, after having served his apprenticeship with the firm, is generally worth more than a new man would be, as he knows where everything is, what will suit the boss, and also how to "hit" the customers, an accomplishment that requires time and experience.

THE BALANCE-WHEEL.—When a piston speed of 250 or 300 feet per minute was considered full fast, there was not absolute need of the balancing of rotating parts, and the fly-wheel could carry without perceptible jar 50 or 100 pounds extra at one point of its periphery without being noticed. Indeed, the old-fashioned stationaries had a simple balance-wheel, not intended to be used as a pulley, and whether cast whole or in segments afterward bolted together, was hung very much in the state in which it came from the foundry. But with increase of speeds came the requirement of a careful balance in the large wheel, and with a piston speed of 600 or 700 feet an unbalanced fly-wheel would soon become a flying-wheel, or a wheel of flying fragments.

A DURABLE RUST JOINT.—To make a rust joint that will bear heat, cold and rough usage, the following formula has been highly recommended: Ten parts of iron filings, three parts chloride of lime, and enough water to make into paste. Put the mixture in between the pieces to be joined and bolt them together, leaving until dry. After 12 hours the cement has been known to break off the solid iron.

What Every Subscriber Should Have.

AN EASY BINDER.—A. T. Dewey's Patent Elastic Binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Publishing Co's. journals, Harper's Weekly and Scientific American, 85 cents; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. Send to this office for illustrated circular. Agents wanted.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

SOME men are at work prospecting for diamonds on Dry creek, Amador county, where the formation is said to be favorable. Some very small diamonds have been found both there and at Cherokee.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements, Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present its power as an advertising medium is unsurpassed.

DEWEY & CO., Publishers,
220 Market Street, San Francisco.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Cicular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY & CO., Publishers, 220 Market St., San Francisco.

The Evans School
OF
PRACTICAL ASSAYING,
Rooms 6 & 7, First Floor Sherman B'g. } 606 Montgomery St., San Francisco,
Also, Evening Classes, 7 to 10 o'clock.
JOHN T. EVANS, M. A., Principal.

A MECHANICAL DRAUGHTSMAN AND ENGINEER, with years of experience in general and construction work, desires a position on the Pacific Coast; can give the best of references as to ability. Address, F. L. DEPEW, Hotel Haviland, Suit No. 5, Boston, Mass.

Assessment Notices.

Gover Mining Company—Location of principal place of business, San Francisco, California. Location of works, near Drytown, Amador County, California.

NOTICE is hereby given, that at a meeting of the Board of Directors held on the 23th day of November, 1888, an Assessment (No. 1) of Fifteen (15) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Nos. 13 and 15 Fremont street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 5th day of January, 1889, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on Tuesday, the 29th day of January, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.

OFFICE—13 and 15 Fremont Street, San Francisco, Cal.

Lord of Lorn Gold and Silver Mining Com-pany. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Gold Hill Mining District, State of Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 19th day of December, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 313 California street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 21st day of January, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 11th day of February, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.

OFFICE—313 California St., San Francisco, Cal.

STOCKHOLDERS' MEETING.

OFFICE OF

The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, San Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 18, 1889, at 3 o'clock P. M. By order of the Board of Directors.

J. M BUFFINGTON Secretary.

OFFICE—Room 11, No. 303 California Street, San Francisco, California.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents,
220 Market St., Elevator, 12 Front St., S. F.
TELEPHONE No. 658.

DIVIDEND NOTICE.

The German Savings and Loan Society,
526 California Street.

For the half-year ending December 31, 1888, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on Term Deposits, and four and one-fourth (4¼) per cent per annum on Ordinary Deposits. Payable on and after Wednesday, January 2, 1889.

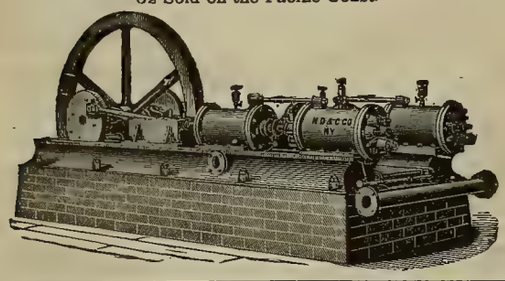
GEO. TOURNY, Secretary.

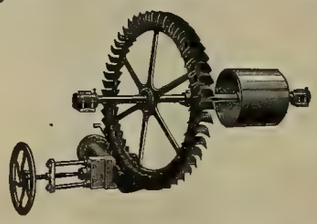
COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 225 and 227 First St., San Francisco.

NATIONAL AIR COMPRESSORS.

SINGLE OR DUPLEX, STEAM OR BELT POWER.
62 Sold on the Pacific Coast.



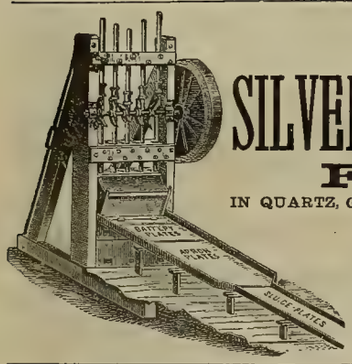


KNIGHT'S WATER WHEEL,
—FOR—
MILLS, PUMPING AND HOISTING.
Over 300 in use. All estimates guaranteed. Send for Circular.

MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth of 350 feet, giving entire satisfaction to the prospector. Price, complete, $200. 150 sold on this Coast.

NATIONAL ROCK DRILL.
200 Sold on this Coast. Has less repairs than any other Drill.



NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
108 and 112 First St., San Francisco, Cal.

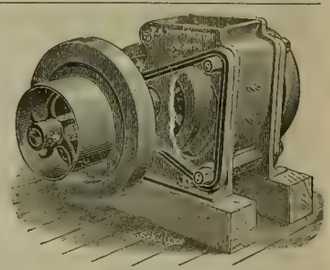
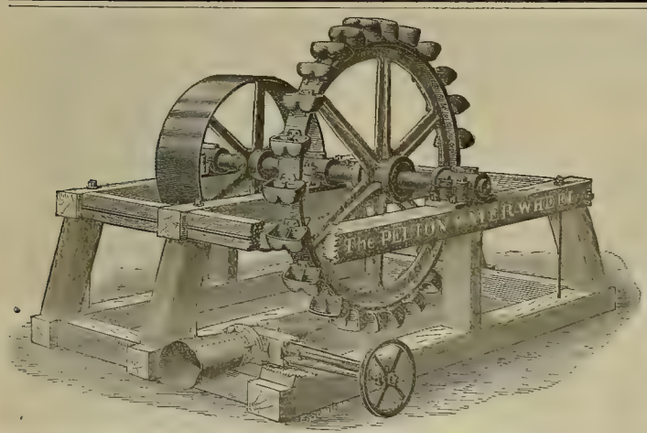
No. 45 FREMONT STREET, - - SAN FRANCISCO, CAL.



ORE CRUSHER



THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

☞ SEND FOR CIRCULAR. Address:

THE PELTON WATER WHEEL CO.,
120 First Street, - - San Francisco, Cal.

SAN DIEGO ASBESTOS MINING & MFG. CO.,

J. D. HOFF & CO.

Office and Works at Pacific Beach, San Diego County, Cal.

ASBESTOS Boiler and Steam Piping Covering saves 25 per cent fuel. Asbestos Indestructible Fire Proof Roof Paint will not fade or come off. Colors, Red and Brown. Asbestos Indestructible Fire Proof Cement for backs of burnt-out Stoves, Ranges, and plastering over fire brick where intense heat or oil is used to preserve them. Rate of freight quoted to all parts of the U. S.

FOR SALE.

The Empire Foundry and Machine Shop in the city Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., etc., will be sold on easy terms. A first-rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address
R. HOSKIN, Marysville.

ESTABLISHED 1866.

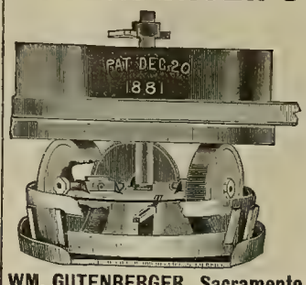
Pacific Chemical Works.

HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

GUTENBERGER'S ROLLER ORE CRUSHER.



Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gearings, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working. The first ore crusher used in Durango, Mexico, was built at my shop in Sacramento, and under my patent.

☞ Any Infringement on this Patent will be prosecuted to the full extent of the law.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

SAN FRANCISCO CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.,
611 and 613 Front St., San Francisco, Cal.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder 50 cents additional per volume.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,

258 Market St., N. E. cor. Front (up stairs), San Francisco. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

MISSES DEVLIN,

Stenographers and Typewriter Copyists,
Room 7, No. 240 Montgomery St.,
S. E. corner Pine, - - San Francisco.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Lefler, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 34 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

The Moon.

The picture of the moon that we present to our readers in this week's PRESS is enlarged from a photograph of 5½ inches to the size shown, and is taken from a negative made at the Lick Observatory by Prof. Burnham, assisted by other Lick astronomers.

The view given is as seen in an inverting telescope, such as is always used by astronomers. Many of the craters and prominent features are very well shown on the right-hand edge, technically termed the terminator. The small dark spot, about three-fourths of an inch from the bottom, showing an almost complete white ring, is the crater or ring-plain, known to astronomers as Plato. About half an inch above and slightly to the left will be seen an almost straight black mark three-eighths of an inch long. This is known as the Great Valley of the Alps, it being in the heart of the range of mountains known as the Lunar Alps. The range of mountains above running from left to right is known as the Lunar Appennines, and the large crater to the right of the two smaller ones is known as Archimedes.

Several points of light on the right-hand edge, apparently in the darkness, are the shadows of lunar mountains, the sun not being high enough to show the land between them and the main body of the moon. This may be easily understood when it is known that the sun rising, for instance, on the Sierra Nevadas before the intermediate ground between the Sierra Nevadas and the Coast Range is illuminated, the tops of the mountains, if viewed from the moon, would be seen as points of light. In other words, the rough edge of terminator on the right of the picture is the point of sunrise on the moon; the shadows all bend to the right.

It will be noticed that several craters have a small bright point in the center. This is the central cone or mountain, and it will be noticed that the shadow is always on the right of this little point of light, while the shadow on the left is caused by the crater wall. The partly shadowed portions to the left are smooth plains supposed to have been at one time the old ocean beds of the moon, *Mare Christum* being prominently seen in the left-hand edge or limb.

All the white portion toward the left is a mountainous and hilly region, and would show as rough as the portion on the right-hand edge if the shadows could be seen. The rough portion on the right-hand edge would, in about three days after this picture was taken, be a glaring white mass like that portion shown to the left, and a new region would be in view showing all the wild rugged grandeur seen upon the terminator in the picture. It will be noted that there are three craters just above the center at the right-hand side linked together. The middle one is the oldest of the three, the one at the bottom being perfect, having crushed in the wall of the middle one by a great gorge between them; the small crater (about 20 miles across) is just on the wall of the lower crater. The small crater appears just to the left of the center of the large crater on the crater floor, showing as a round white dot with small shadow on the eastern left-hand side (as seen in the telescope). It is impossible to describe all the features plainly brought to view without extending this article beyond reasonable limits.

The small irregularities noticed upon the eastern side of the limb are lunar mountains that are at right angles to the eye. These, of course, do not show without close inspection, but it must be remembered that the moon is about 2160 miles through, and it would require a very large mountain to show itself upon the edge.

THE MOON AS SEEN THROUGH AN INVERTING TELESCOPE.

EL DORADO SLATE.—The El Dorado Big Tunnel and Mining Co., which is driving a tunnel 3400 feet in length on its mining ground about a mile and a half north of Placerville, El Dorado county, has struck, at a distance of 470 feet from the mouth of the tunnel, an immense body of superior slate, which bids fair to exceed in value the gold-bearing quartz lodes, for the development of which the tunnel is being driven. The tunnel now penetrates this slate body 35 feet, at a distance of 350 feet beneath the surface of the ground. Expert slatemen, who have derived life-long experience in the slate quarries of Wales and Pennsylvania, have examined the slate and pronounce it superior to any they have ever seen, entirely free from foreign or metallic substances, and of a texture that permits it to split to the thinness of paper with but a trifling waste.

THE San Diego *Union* of Dec. 27th, says: At noon yesterday the water in the Sweetwater dam had reached the greatest depth in the history of the immense structure. The depth registered at that time was 51 feet 6 inches, and more water has flowed into the dam during the present rain than has been used from it during the entire year.

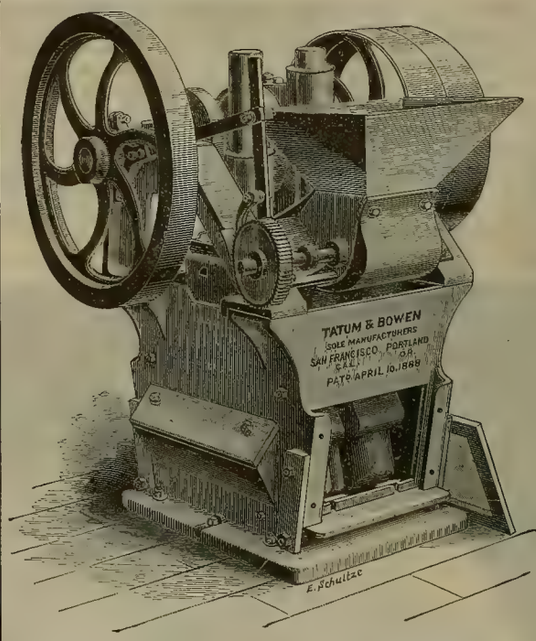
—THE—

PERFECTED DOUBLE Economic Stamp Mill.



BEST and CHEAPEST In the World.

AFTER SEVERAL YEARS OF EXPERIENCE we have finally perfected this Mill. Our principal improvement consists in oscillating the stamps by means of sleeves with universal joints, allowing the stamps the utmost freedom of movement, without tendency to bind or cramp in the working parts.

Several Mines Using Them Have Ordered Others.

WE HAVE ALSO

A NEW ROCK BREAKER.

CIRCULARS WILL SOON BE READY.

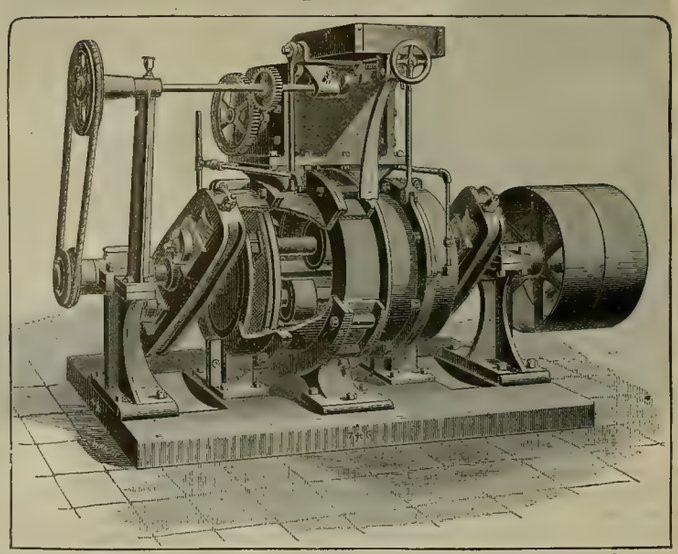
TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,

Manufacturers and Dealers in Machinery of all Kinds.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Jan. 3, 1889.

As stock-taking and the annual settlements are about over, general trade is expected to run in its usual channels. There is a prevailing opinion that 1889 will be an unusually prosperous year in all lines of trade and manufactures, based on an increasing population, extension of railroads and more general improvements throughout the coast. The mining industry also promises to be more largely developed than for several years past. Money is reported to be easier, with the banks disposed to extend liberal accommodations. In last month the regular dividends declared in this city by incorporated companies aggregated $502,850, of which sum $252,250 was disbursed by mining companies. To the above will be added at an early day in this month the quarterly, semi-annual and annual dividends of companies that do not pay regular monthly dividends. It is stated that by the middle of the month we will have a very easy money market unless a mining stock deal is sprung, but which well-informed parties hardly look for until later on in the year. While this may be the case, there is no denying that the mining-stock market is attracting considerable attention, owing to the active work going on in the leading mines listed on the two stock exchanges. The character of much of this work is kept quiet, but from all reliable information obtainable, it is very important and should result favorably before many weeks pass. As has been stated, the work being done runs toward the West or Red Lode, where the mines, following the lead of West Con. Virginia, are preparing for active work. The latest mine to begin action is the Andes, which has lain dormant for several years past. The pulp assay returns of ore crushed from the Chollar averaged the past week $21 a ton, Hale and Norcross, over $25, and Savage, over $20. It is thought that when the Mining Stock Association gets into good working order, which will probably be at an early day, the ore from the above mines as well as from the other mines will give much better returns, and outside holders of stocks be better protected. The Bodie mines are reported to be working into better position for ore extraction, as are the Tuscaroras and the Quijotoas.

It is stated by authorities in Virginia City that the Comstock mines yielded in bullion $6,353,848 last year, and since 1875, $149,999,777.

The sale day of the Sutro tunnel has been postponed to the 14th of the present month. It is reported by well-informed parties that a New York syndicate has been organized to buy the property.

SILVER—The market gained in strength up to Saturday, after which it fell off, but closes steady and firm. The available supply in this city continues light, necessitating buyers bidding well up to meet their wants. There was coined at the mint in this city last year as follows: Standard dollars, $657,000; quarter dollars $304 000; dimes, $172,000; total, $1,133,000. There was imported into this port in 1888 silver as follows: Foreign bullion, $2,386,120; American coin $133,535; and foreign coin, $390,484; total, $2,910,121. The exports by sea in 1888 were as follows: To Hong Kong, bullion, $4,572,900; Mexican dollars, $5,339,948; to Japan, bullion, $1,853,800; Mexican dollars, $180,000; to Bombay, bullion, $3,036,503; to Calcutta, bullion, $419 - 503; elsewhere, bullion, $5300; Mexican dollars, $165,335; silver coin, $44 656; total, $15,637,439. The Comstock mines promise an increase in their silver production for the next few months.

The local silver market closed strong to-day at 92¾c bid, with light offerings. London cables quote 42½d, and telegrams from New York quote that market at 92¾c.

QUICKSILVER—The market the past week ruled steady with only a fair demand. The exports hence by sea in 1888 aggregated 11 933 flasks, against 18,619 flasks in 1887. China took in last year 3758 flasks. New York 2320, and Mexico 4766. Compared with 1887, China took 153 flasks more, while Mexico took 1631 flasks less, and New York 6050 less. The receipts of quicksilver at this port for the past three years were as follows: 1888, 22,825 flasks; 1887, 28,085; 1886, 17,345.

LEAD—The market is reported quiet but steady. New York mail advices report that the upward movement there was brought about by free purchases of early options by some large operators who had bought at low prices.

BORAX—The market is quiet. The exports last year aggregated a little over 6,500,000 pounds; in 1887, 10,692,055 pounds, and in 1886, 11,733.596 pounds. The receipts at this port last year aggregated 7,321,800 pounds; in 1887, 7,532,500 pounds, and in 1886, 7,929 700.

IRON—There is nothing new to report in the market. Holders and importers are firm in their views, while consumers are offish and only buy in a hand to-mouth way.

COAL—Receipts at this port in 1888 aggregated 1,386,463 tons, in 1887 1,113,878 tons, and in 1886 1,087,690 tons. The arrivals at San Diego and San Pedro in last year aggregated 101,368 tons; in 1887, 68,996 tons; in 1886, 20,986 tons. The demand for steam coals is increasing, with the call confined to no particular section. The colder weather is producing a better inquiry for house coal. As yet there is no change in prices, although it is stated that the tone of the market is firmer.

COKE—The market continues to rule very strong under light supplies and a good inquiry. The importations in last year aggregated 25,763 tons; in 1887, 22,657 tons.

Eastern Metal Markets.

By Telegraph

NEW YORK, Jan. 3, 1889.—The following are the closing prices the past week:

	Silver in London	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 7 16	92¾	$17 20	$3 75	$21 80
Friday	42⅜	93¼	17 30	3 90	21 95
Saturday	42⅜	93 1-16	17 35	3 90	21 90
Monday	42 9-16	92⅜	17 40	3 92½	22 15
Tuesday	....	....	....	....	....
Wednesday	42⅜	92⅜	17 25	3 90	21@22

Borax was steady at 8⅞@9¾c for refined and 8@8¼c for concentrated. Quicksilver is very quiet, but lower, 58@60c being quoted. Bids for lake copper were made at $17.10@17.30; January, February and March delivery, $17.40@17.50 asked. Consumers obtain useful material at $16.50. Pig lead has worked up to $3.85@3.90, without material transfers. Six hundred tons will be sold by auction to-day. Refined petroleum is easier and a decline is expected. Barrels, $7.10; plain cases, $9.10.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, ——@——; Billiton Tin, $24.50@——; Banca Tin, $24.25@24.50; Baltimore Copper, ——@——; Oriord Copper, $16.00@16.25; P. S. C. Copper, —— @ ——; Foreign Lead $4.75@5.00; Foreign Spelter, $5.90@6.00; Antimony, Hallett's, $10.75@11.00; Cookson's, $12.50@13.50.

Mining Share Market.

The market has been quiet during the week and transactions have been few, with little change in prices. The Virginia *Enterprise* says: The electricians are still at work drying out the electric generator in the Chollar electric chamber. It has been found that the humidity in the chamber is 78 per cent, but it is believed that when once the dynamos are in successful operation they will keep themselves dry. They expect to be able to make another test run about the 1st. The mill is now running 40 stamps propelled by the surface Pelton wheel, but it requires about 300 inches of water to make her go. This quantity of water will be understood when account is taken that the California mill, under its wire-rope system of transmission, runs 60 stamps, grinding about four tons to the stamp to the Chollar's three, with only 140 inches of water. Of course the California mill uses its water three times over after it runs off from its surface wheel, while the Nevada mill uses only a surface wheel.

The Sutro Tunnel Co. are figuring upon a project to extend their tunnel through the Silver Hill and on west to the Baltimore, a distance of about one mile. With their present facilities, it is believed that the total cost would not exceed $200,000. The tunnel would strike the Silver Hill at a depth of about 800 feet, and would strike the Baltimore at a depth of about 1200 feet.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Navajo, Jan. 3, $14,000; Hale and Norcross, 2, $87,488; Con. California and Virginia, Dec. 29, $46,880; Hanauer, 29, $4830; Woodside, 29, $6450; Hanauer, 30, $2250.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but competent men.

A. F. JEWETT—Tulare Co.
F. B. LOGAN—Southern California.
H. G. PARSONS—Northern California.
GEO. WILSON—Sacramento Co.
W. B. FROST—Fresno Co.
W. W. THEOBALDS—San Diego Co.
JOHN L. DOYLE—Utah, Wyoming and Colorado.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL OF YOUR PAPER.

CORRECTION.—Mr. C. H. Aaron writes us as follows: "In my article, No. 4, on Lixiviation, second paragraph, in second column, for 'add solution of calcium carbonate,' etc., read 'add solution of calcium chloride as long as it precipitates; if the liquid still reacts alkaline, caustic is present,' etc."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING DEC. 25, 1888.

394,958.—ELECTRIC BELTS—S. Colling, Oakland, Cal.

395,046.—PIPE-WRENCH — C. H. H. French, Hollister, Cal.

395,052.—ROLLER-BEARING—R. W. Hent, S. F.

395,150.—DENTAL ENGINE—W. A. Knowles, Alameda, Cal.

394,989.—HARVESTER—J. N. Miller. S. F.

395 072.—CAR-COUPLING—F. Ott, Estrella, Cal.

395.096.—FIRE ALARM—Alex. Watson, S. F.

395,097.—CANDLESTICK—G. Werntz, Placerville, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRAIN-HARVESTER —Jens N. Miller, S. F. No. 394,989. Dated Dec. 25, 1888. The invention relates to certain improvements in harvesters of that class in which a comb projects in front and takes off the heads of the grain, while a revolving beater receives and thrashes these heads as they pass backward from the comb. The patent covers certain constructions and combinations of devices.

MINER'S CANDLESTICK. — Gabriel Werntz, Placerville, El Dorado county. No. 395,097. Dated Dec. 25, 1888. The handle portion has a ring at the rear end and the spear point for pushing into the timber may be detached and reversed so the point will project into the ring, thus shortening the candlestick when not in use so it may be carried in the pocket. There is a detachable hook also, by which it may be hung up. The candle socket has an automatic extinguisher, so that when the candle burns down low it will be extinguished. By having a jointed and detachable spear the candlestick may be made of greater length, so that there is not so much danger of the candle igniting dry wood which may be near it, while at the same time by uncoupling the parts the implement may be conveniently placed in the pocket.

BATTERY-CELL FOR ELECTRIC BELTS — Simeon Colling, Oakland. No. 394,958. Dated Dec. 25, 1888. This invention relates to that class of electric or galvanic belts in which a number of separate independent cells or batteries are connected together flexibly, the whole being attached to a suitable band which is fitted to the wearer. The invention consists in a certain novel construction of the independent cells or batteries, and the connection in series. The object is to construct in a belt of this class a cell or battery which can be readily disconnected from the adjacent ones, and can be easily taken to pieces for the purpose of renewing the parts.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

Successful Patent Solicitors.

As Dewey & Co have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

A CLUB has been organized in this city to pursue the study of Volapuk, the "universal language."

ENLARGED!

RAND, McNALLY & CO.'S

BUSINESS ATLAS,

1889.

WILL BE DOUBLE THE SIZE OF ANY OTHER ATLAS PUBLISHED.

New Size of Page, 15x21 Inches.

☞ It will contain new large scale maps occupying two pages only (no cut-up maps) of all the important States

The entire arrangement will be new, embodying the most improved methods of reference and indexing, clearly showing the location, population and commercial advantages of over 200,000 towns in the United States, Canada and Mexico.

RAND, McNALLY & CO.,
148 Monroe St., CHICAGO.

CALIFORNIA IRON YARD.

SECOND-HAND BOILERS AND OLD MACHINERY
Of every description
The Highest Price paid for all kinds of Metals.
OFFICE AND YARD: 128 and 130 Folsom St., S. F.
Telephone No 67.

H. M. RAYNOR,

No. 25 Bond St.,
NEW YORK.
ESTABLISHED 1859.

PLATINUM FOR ALL Laboratory —AND— Manufacturing Purposes.

Wholesale and Retail
Native Platinum and Scrap purchased.

HORACE D. RANLETT,

Ores, Mining, and Commission,
420 Montgomery St., S. F.
BUSINESS MANAGER OF
UNION COPPER MINE, Calaveras Co.,
NEWTON COPPER MINE, Amador Co

Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce

STORAGE

We have some extra room suitable for storage purposes, which we will let on very reasonable terms.
DEWEY & CO., 220 Market street, San Francisco, Cal.

B. E. HENRIKSEN'S
PATENT
Automatic Safety Clutch
For ELEVATORS.

Simplest, Strongest & Most Reliable.

Constructed upon Scientific Principles.
Operates and Sets Automatically and Ever Ready for Service.

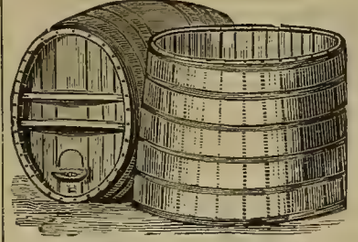
Entirely free from all springs, pawls, triggers, governors and other unreliable parts likely to stiffen, corrode or gum up.

ALWAYS IN FULL SIGHT, BUT NEVER REQUIRING ANY ATTENTION.

Has been practically tested in six actual elevator accidents and saved 51 persons from injuries and death.

SILVER MEDALS awarded by the Mechanics' Institute in 1880, 1882 and 1883. SEMI-CENTENNIAL GOLD MEDAL awarded by the American Institute of New York, Dec. 3, 1887. Apply to

B. E. HENRIKSEN, Architect.
218 Post St., San Francisco.



WATER TANKS, WINE TANKS!
CALIFORNIA WINE COOPERAGE CO.,
FULDA BROS., Proprietors,
30 to 40 Spear St., San Francisco
ALL KINDS OF CASKS, TANKS, Etc.
☞ SHIP, MINING, and WATER TANKS a Specialty. ☜

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

THE DUCKER PORTABLE HOUSES

Combine all the comforts and advantages of a permanent building with the qualities of **Simplicity, Stability, Lightness, Ease of Transportation, Quickness of Putting Up and Taking Down, Ventilation, Heating, and Facility for Cleansing.** Equally serviceable for **Contractors' Uses**, for **Sheep** and **Cattle Ranches, Mining Camps** and for **Surveyors** and **Prospectors, Hospitals, Seaside** and **Summer Resorts,** and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to have to go after. These Buildings can be especially constructed for **Hunting** and **Fishing Camps, Billiard Rooms, Photographers' Studios** and **Lawn Pavilions.** They are built in sections and are put up without the use of screws, nails or any external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time without skilled labor. Price, **$250 to $750. Thoroughly reliable and influential business men only, may communicate with this Company relative to acting as its representative.**

Address DUCKER PORTABLE HOUSE COMPANY, 32 Nassau St., New York.

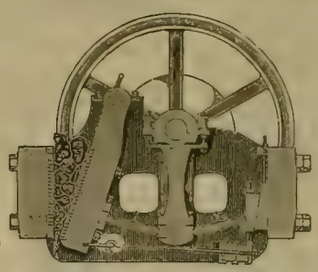
Portland, Or. Sydney, N. S. W.

PARKE & LACY,

21 and 23 Fremont Street, SAN FRANCISCO, CAL.
— IMPORTERS AND MANUFACTURERS OF —

MACHINERY

ENGINES, BOILERS, STEAM PUMPS.



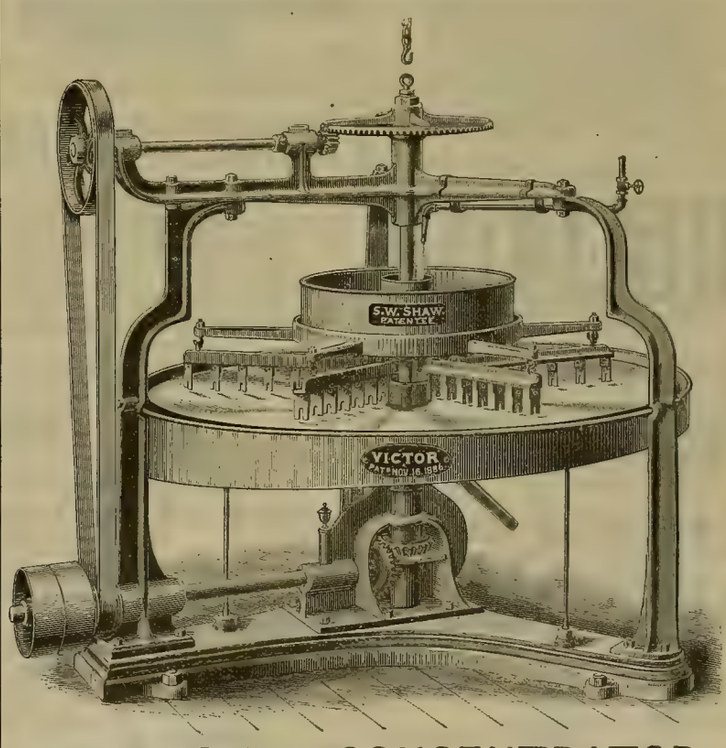
ROCK BREAKERS, PULVERIZERS, CONCENTRATORS.

GIANT ROCK BREAKER.

Westinghouse "Standard" and "Junior" Engines, Rock Drills and Air Compressors. Saw and Planing Mill Machinery, Machine Tools, Governors, Injectors, Oil Cups, and Lubricators.

BELTING, OILS and GENERAL SUPPLIES.

We are prepared to give estimates for Hoisting Works and Pumping Plants, Stamp Mills, Smelters and Concentrators.



THE VICTOR CONCENTRATOR,

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,
17 and 19 Fremont Street, SAN FRANCISCO.

LIDGERWOOD M'F'G CO.

MANUFACTURER OF
HOISTING ENGINES.

300 Styles and Sizes. 4500 in Use.

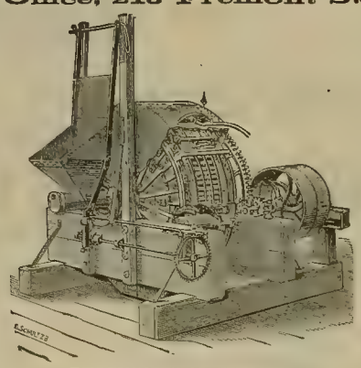
HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St., San Francisco.



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

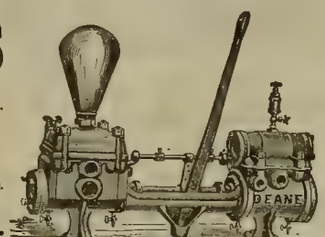
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.



DEANE STEAM PUMP.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS

A specialty. Round, slot or barred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

Also Sawmill Machinery.

EXCLUSIVE AGENTS FOR THE PACIFIC COAST OF

HEINE PATENT SAFETY BOILER and MACBETH STEEL PULLEY.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO., SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to sliming, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scraper-s, a much less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequaled by any mill now in existence.

Yours truly, D. M. BURNS, Superintendent

PACIFIC IRON WORKS

We are also prepared to **CONSTRUCT** and **DELIVER** in **COMPLETE RUNNING ORDER,** in any locality, **MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC.,** of any **DESIRED CAPACITY.**

THE GATES,

THE GREATEST ROCK CRUSHER ON EARTH!

WHAT IS SAID OF IT BY ONE WHO HAS USED IT THREE YEARS.

OFFICE OF ERNEST L. RANSOME. MANUFACTURER OF ARTIFICIAL STONE AND CONCRETE. No. 508 CALIFORNIA STREET, SAN FRANCISCO, November 9, 1888.

Pacific Iron Works—GENTLEMEN: In answer to your request for my experience with the Gates Crusher would say, that I have used one for the past three years crushing trap rock, basalt and granite for making concrete, the most of it being very hard and calculated to test severely the strength and durability of any machine.

I have crushed in that time probably not less than 10,000 tons of this material, without any repair being necessary, and without any change of shoes and dies, and, as far as I can judge, they appear to be good for as much more service.

I have had more or less experience with nearly every crusher in the market, and regard the Gates as infinitely superior to them all. In fact its efficiency, durability and capacity for work is simply wonderful. For crushing all kinds of ore, ballast or macadam—fine or coarse—nothing can compare with it. You are at liberty to refer any parties to me who may want further evidence as to the merits of this remarkable machine. Very truly yours,

ERNEST L. RANSOME.

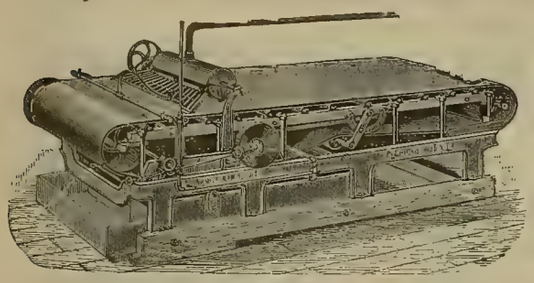
$1,000 CHALLENGE ACCEPTED,

PRICE, IVE HUNDRED AND FIFTY DOLLARS ($550.00).



THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

SAN FRANCISCO, SATURDAY, JANUARY 12, 1889.

VOLUME LVII. Number 2.

British Columbia Mines.

We had a conversation, a few days since, with Mr. Wm. Craib, superintendent of the Nicolia Mining Co., Yale district, near Kamloops, British Columbia. There are about 150 men in the district, 60 of them working for the Nicolia Co. They have no mill as yet, but are developing the mine and properly opening it. Three shafts are being sunk, the deepest of which is down 290 feet. The ore extracted is stored away for future use, as it is not intended to put up a mill until next season. When erected, it will have a capacity of 100 tons a day. The company is a wealthy one and can afford to open its property thoroughly before putting up reduction works. They are investigating the workings of the Russell process, and may use that in beneficiating their ores.

The district covers an area five or six miles long by about three in width. The ledges average about two feet, and the ores will run from $30 to $500 per ton. Some has just been worked at Luckhardt's in this city and turned out very well.

Other prominent mines in the district are the Mary Reynolds and the Star. The former of these has been shipping ores to the Selby lead works which run from $100 to $150 per ton. The ores of the district are silver, galena, and gray copper, the latter predominating. There is plenty of wood close by, and water enough for mills though there is not sufficient for power purposes.

In Kootenai district, about 200 miles from Yale district, there are some splendid prospects in gold, silver and copper, some of the copper-silver ore running as high as $3000 per ton in silver.

While there are some rich gold quartz veins in the region, the majority of the claims are silver mines. Mr. Craib has great faith in the mineral resources of the area referred to, thinking that in time it will be proved to be the most prominent mineral country on the coast. He has been ill since his arrival in this city, but is improving, and will return to British Columbia in a couple of weeks.

The Gibbs Camera.

Of late years, since the invention of dry plates, the manufacture of photographic cameras has largely increased, owing to the demand for them by amateur photographers. This demand has been met by manufacturers, who have made every effort to improve their appliances, and, as a result, many forms and styles have been put upon the market. A difficulty with most of these cameras, however, is that there are too many parts to them, and that a separate carrying-box is necessary. Mr. Wm. C. Gibbs of Oakland, who is a member of the Pacific Coast Amateur Photographic Association, has devised and made several forms of camera himself, finally inventing one which needs no separate case or box, having within itself parts which, ordinarily essential to its operation when in use, yet have the further function of completing a perfect case or box, so that the camera is self-contained. This he has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, assigning a half interest to George W. Dornin of Oakland, also a member of the association.

The engravings given herewith show the general plan of the camera, and also the details of construction and operation. Fig. 1 is a vertical section, showing the end lids open and in position for use. Fig. 2 is a perspective view showing the end lids just being opened to expose the camera ends. Fig. 3 is a front view, showing the finder support and focusing carriage. It will be seen that the back and front ends of the case, when dropped to expose the operative parts of the camera proper, serve as the supporting bed and the focusing platform respectively. The focusing carriage is arranged in a novel way and the finder is made to fold in out of the way, not being detached.

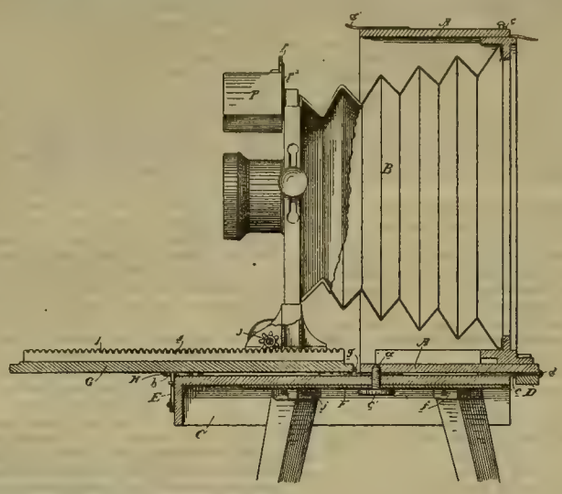

Fig. 1.—VERTICAL SECTION OF THE GIBBS CAMERA.

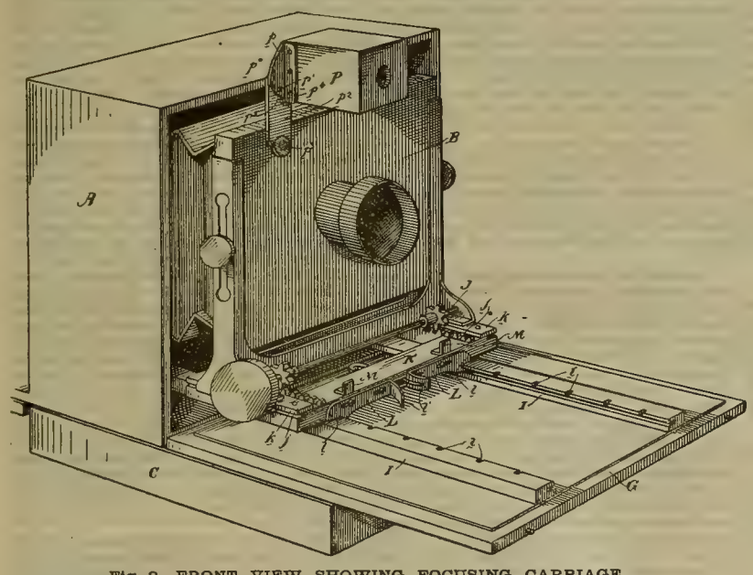

Fig. 3.—FRONT VIEW SHOWING FOCUSING CARRIAGE.

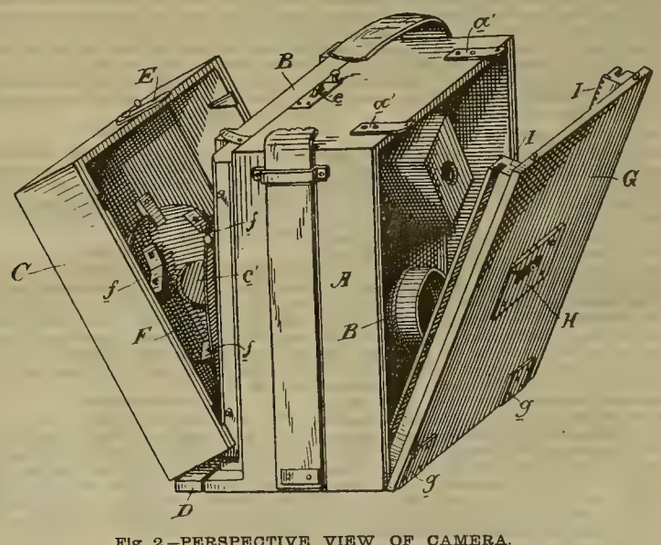

Fig. 2.—PERSPECTIVE VIEW OF CAMERA.

A is the body of the camera-box or case, consisting of a four-sided open-ended frame inclosing the ordinary parts of the camera, here represented, generally by *B*, and including on one side the ground glass, on the other the front board, the lens and its connections, and between them the bellows.

C is the back of the case or box, consisting of a flanged lid adapted to fully cover and inclose the back of the camera. This back lid is connected with the base of the body-frame by a hinged connection which will permit it to be dropped down to expose the camera back and be turned up *under* the body-frame for the latter to rest on. In the present case the connection is shown as being made through the intervention of a strip, *D*, to which it is hinged at *C*, this strip being itself hinged at *d* to the base of the body-frame. Now when the back lid is in position to cover the camera back the strip *D* lies in a horizontal position in the plane of the base of the body-frame and the back lid or cover occupies a vertical position, being secured by the engagement of a pivoted latch *E* on its top with a small catch *e* on the top of the body-frame.

In uncovering the camera back the back lid or cover *C* is dropped down to a horizontal position, turning on its hinges *c*. It does not stop here, but, the camera being lifted, this back lid is swung in down and up again, turning with the strip *D* on the hinges *d* to a horizontal position in the other direction, so that it lies under and forms a bed plate for the camera body-frame, projecting, however, forward of said frame for another purpose hereafter described.

The back lid or cover is firmly set in its position under the main box, where it serves as the bed, by a thumbscrew *c* or clamp, mounted on the lid and engaging a threaded socket *a* in the base of the box itself. This back lid is provided on its under surface with the tripod head *F*, having the usual lugs, *f*, so that this lid becomes the support or foundation for the camera when carried on the tripod.

G is the front lid of the body-frame of the camera-box or case. It is hinged to the base of the body-frame at *g*, and when in an upright position completely covers the front of the camera, being held by spring catches *a'* above. By releasing these catches the front lid may be dropped down to a horizontal position, so that

(*Concluded on page 24.*)

CORRESPONDENCE.

We admit unindorsed, opinions of correspondents.—EDS,

Amador County Mines.

EDITORS PRESS:—Ione valley, though one of the most prolific in the State, has its drawbacks, as it is in litigation between the S. P. R. R. and the Colton estate. It was originally a grant and purchased by Colton, it comprising many thousand acres that could support 3000 or 4000 families, where cattle now roam. As the railroad encourages immigration, these lands should be thrown open. In abounds in timber, gold and lesser minerals. The famous clay at Carbondale, hydraulic mines at Irish Hill, and many strong gold veins passing through the land make it one of the most valuable pieces of property in the State, to say nothing of the coal deposit.

Nowhere in Amador are there such strong croppings as 4½ miles from Ione. The ledge, 8 to 20 feet wide and some places 18 feet high, will most all prospect, and the sulphurets show a good character for the surface. There are other parallel ledges in slate and porphyry. One owned by Mr. I. W. Loomis is about two feet wide, and has milled $22 per ton. It can be traced some 3000 feet, as far as your correspondent had time to see; even the hillside pays to sluice, it being the source of Mr. Loomis' principal income. It only rests for a short time before public attention will be drawn this way as it warrants it. At Plymouth, all is again activity.

Amador

Keeps on with its usual tenor with few exceptions. The mines are all doing as usual. Many years will pass ere this little town will succumb. As the old ones pass into oblivion new ones are coming to the front. We can mention the Gover as one.

Sutter Creek

Looks in a prosperous condition, and the rebuilding since the fire has made it one of the most beautiful of mountain towns. The Wildman mine is developing greatly, to the satisfaction of the superintendent and its owners. The old Eureka days may not be far distant again. The Stewart-Lincoln and others expect good clean-ups during the winter and spring. All are well supplied with timber, wood, etc., so inclement weather will not hinder work.

The Kennedy at Jackson is running full force, and, from the happy expression on Superintendent Park's face, must be looking well.

Going south a short distance, we see a two-stamp mill pounding through the 24 hours. It is owned by three miners, who do their own work. Their mine is a paying one, though the ledge is small.

A short distance below is the New York mine. The ore is in abundance and good grade.

The Zeile is always good under able management and its never-ceasing stamps. Adjoining the Zeile mine and connecting with the famous Moore mine is a tract of land of some 80 acres belonging to Messrs. Evans and Meek Bros. Through this property three well-defined ledges pass and are opened so they can be examined. It is a rare chance for capital.

Amador Gold Mine.

Enterprise and perseverance has made this, under Superintendent Minear's administration, a mine Jackson can well be proud of. All the thousands they have paid out are as a drop in the bucket to what is to come. With their new 60-stamp mill and the mine so systematically opened, the mill can run without cessation. Few mines, if any, in the State will be able to work their ores at as low cost, and grand results may be expected.

Toward the river are many valuable properties which only need capital to make them paying, as they are developed sufficiently to allow a full investigation. Persons who have for years been interested in the Old Hardenburg are now turning their attention to the adjoining ground through which the ledge passes. It belongs to Mr. F. Sanguinetti and can be traced through his whole property of 160 acres.

Mr. Petrie of the Ilex Co., with Messrs. Tripp & Littlefield, are putting up a 10-stamp at Big Bar. The ledge in the mine is from 8 to 12 feet wide, and they will have some 230 feet of a stope, so the mine will be able to run at a very small expense. In much of the ore the gold is visible to the naked eye; everybody wishes them success. Col. W. F. Robinson owns the adjoining claim, the Cleveland, which shows an abundance of good rock.

On Esperanza creek the Zumalt Bros. are running an arastra, and each cleanup so far has been more than satisfactory.

Irishtown and Vicinity.

Messrs. Askey & Reed have completed a new ten stamp, the old five-stamp having been destroyed by fire a few months ago. The mine is a large, well-defined ledge of ore, and beyond doubt the highest grade of any mine in this or any surrounding county. It is free milling and easily worked. Beyond a doubt it will make capitalists of the owners.

Messrs. McKenzie Bros.

Have been doing a great deal of development in the vicinity, and have a very large Huntington mill, ample water-power and No. 1 ore. They expect large returns for the thousands invested in preparation; they are the owners of several claims. Some have already brought them handsome returns. They contemplate putting up large works in the near future.

Other claims in this same section only need capital to place on paying basis. At Clinton Mr. Spagnoli's mill is running on good rock from his mine. The cleanups are generally good.

At Volcano, with the exception of a mine worked by Mr. Harry Shannon of San Francisco, little is being done. He has a No. 1 property, and will astonish his friends soon. IBEX.

Calaveras County Mines.

EDITORS PRESS:—Mokelumne Hill is as well known as any town in the State, and all old Californians will remember the call when stages left Stockton and Sacramento. After the good old days of Placer, Big Bar, Middle Bar, and the numerous gulches with their varied names had ceased to pay, the town fell into a kind of Rip Van Winkle sleep, but of late, since numerous quartz mines have been developed, many of which are on a paying basis, the town has again assumed a lively aspect.

Everything was at a standstill until the copious rains started the mills and mines in full force.

In the immediate vicinity we have the Doryea mine, which has been worked the past 18 years, and has, during most all those years, been a paying investment, and from indications will be for years to come.

The Green Mountain mines, about two miles from town, are run by McSorley & Co., the shares all being owned in town. During the past 15 years this has always been a paying property and still continues so. Messrs. Fink & Co. of San Francisco are the owners of a claim at Middle Bar on which they have expended some $27,000 to thoroughly open before putting up expensive machinery. They now have a well-opened mine with a strong vein of high-grade ore which will warrant such an expenditure.

In the vicinity of from three to six miles we have the following mines drawing their supplies from "the Hill":

The What Cheer mine, which is still sinking, are putting new and larger pipe down for the mill, so now with plenty of water we shall expect good results.

The A. and B. gravel claim is sinking with eight-hour shifts, pushing their work with all speed.

At the Foot and Thompson mine at Upper Rich gulch they have graded a new road and have a new ten stamp mill in a building made for 20. Work in the mine has lately been resumed, they having an abundance of rock on hand.

The Ilex Con. Mining Co., Mr. Courtiss superintendent, has been written up fully in your columns. Some time ago on account of low water they were compelled to lay off 80 or 90 men. Immediately reports were circulated very detrimental to this mine that has spent some $350,000 in buildings, machinery and development. They happened to be at that time in very low-grade ore and the outlook was certainly discouraging. But such things will happen to all mines, particularly pocket ledges.

The McGlen is the adjoining property with good hoisting works.

Glencoe.

Messrs. Childs & Gillespie, who are the owners of the old Valentine mine, which was developed by four shafts of different depths and two incline shafts, are pushing work with very satisfactory results, making this little place quite lively.

West Point,

We will have to give in a special letter, as the mines working are too numerous to speak of separately. Lone Star, Keltz, Lockwood, Blazing Star, Water Lily, Rowe and Jenkins and Soaproot are all prosperous properties; a very large number of men are employed here, and at night the place reminds one of a frontier town by its activity.

Angels Camp.

Too much cannot be said in favor of this camp, where are located the largest mines in Calaveras county—the Nevills, Lane, Jones, Tozier, Hayward and Hobart, and the London. Most of these are dividend-paying properties, and all will be. They are equipped with the most improved machinery, as they are under able managers. Over 500 miners are employed here.

San Andreas.

The Union gold mine will assist this county in coming into the ranks of Nevada and Amador counties as a gold-producer. We may even go ahead, as quartz mining here is still in its infancy.

Sheep Ranch.

The Clarence mine has some 80 men on its payroll, with an 80-stamp mill. This is a strong piece of property, with every indication of permanency.

Our mining will not be the only attraction for the outside world, but we defy any county in the foothills of California to produce superior grapes, pears, peaches, plums, etc., than can be found in Calaveras; for health it cannot be excelled. IBEX.

QUICK WORK.—A 5000-ton iron steamship, built in four months, was launched on the Clyde a few days ago. This is thought to be the quickest work on record—a leviathan built in the time it takes a potato to grow!

Our Lumber Interests.

The past year has afforded to the lumber-mills on the Pacific Coast the longest and most profitable season they have enjoyed for many years. Quite recently, however, the prices of lumber have fallen to a very low figure, but even this has not worked any special hardship to the lumbermen, for the reason that it has greatly increased building enterprises and turned hundreds of young men in the direction of home-getting. Every family should have a home of its own. The whole State prospers from any condition of things that tends in that direction.

Sawmill men report that notwithstanding the fact that they manufactured a large amount of fencing lumber this season, they have not now on hand a sufficient quantity to supply the demands, and in several instances the mills have not had a foot on hand. Thus, notwithstanding two dry seasons, our farmers have apparently enough money on hand to improve their ranches by fencing them and building houses where none existed before.

The San Bernardino *Index* speaks of the immense amount of lumber that is being hauled into that town from the neighboring mountains, and determined to ascertain just how many mills were running, and about how many thousand feet have been cut this season. It was ascertained that there were eight mills in operation, and that their total output would aggregate 7,410,000 feet.

High up in the Sierras the mills are obliged to close down in the winter. Advices from Carson of Dec. 5th state that all the sawmills, railroads, flumes, wood and logging camps around Lake Tahoe have closed down for the season. All the men employed around the lakes have left for Carson, Truckee, Sacramento and San Francisco, where they will remain until work opens up again in the spring. The Carson & Tahoe Lake Co. sawed 25 600,000 feet of lumber in their two mills during the season, and cut 28,300 cords of wood, which has been flumed to Carson during the summer.

Puget Sound advices of Dec. 22d say that all the sawmills on the Sound, except the local mills, have shut down and will remain closed till Jan. 2d. The object is to make a "clean-up" for the year, take account of logs on hand, make estimates of the future supply of logs, and in a general way to make preparations for work next year. The past season has been prosperous, and the outlook is good.

Reports from Tulare and Fresno counties say that the lumbermen of that vicinity have had a prosperous season, and immense quantities of timber land have been bought and taken up the past season with a view to active operations in the early future. The mills belonging to the Madera Flume & Trading Co. were closed down about the last of November. Some idea of the immense amount of business transacted by the company can be gleaned from the fact that over 14,500,000 feet of lumber have been turned out by it during the season. The Soquel mill sawed 7,500,000 feet and the California mills 7,500,000 feet. Most of this lumber has been floated down the flume to Madera.

Numerous capitalists, says the Yreka *Journal*, are taking up timber land along the Klamath river in the Happy Camp section, in the southern part of Siskiyou county, with the intention of floating the timber down to the coast line, where it can be cut up and shipped by ocean to San Francisco and other seaports.

Redwood lumber is being shipped to Europe in considerable quantities. The ship India recently took a full cargo of redwood lumber for the United Kingdom. A few years ago several cargoes of this kind were sent to Europe. The last previous cargo was cleared January 24, 1887, by the Remittent, which carried 336,436 feet. The India carries a much larger cargo. Considerable business will no doubt, ere long, be developed in shipping California redwood to Europe. Large quantities have been sent to domestic Atlantic markets both by sea and overland, and with satisfactory results. Even the stumps of redwood trees have been turned to profitable account. The wood is susceptible of fine finish, and the grain and coloring make a pleasing effect. Recently (October 19th) the Norwegian bark Orion left Puget Sound for London with 456,452 feet lumber. This is the first cargo of the kind to clear from the Sound for Europe in some time.

The Humboldt *Mail* says: The Pacific Lumber Company is building a large pond, or reservoir, for holding logs about two miles above the mill. It will cover 12 acres, and will hold an enormous amount of timber.

A large shingle mill at Trinidad, Col., has been started to fill contracts for supplying several million shingles to San Francisco.

Over 500,000 feet of logs were recently tied up at Seattle by suits to foreclose loggers' liens. There were only two suits, and the amount claimed was only $129.

As an instance of quick work the Antioch *Ledger* says: The schooner Jewel recently discharged a cargo at the lumber company's wharf in time that broke the record of all former work in that line. Her cargo of 208,000 feet of lumber was discharged in 19 hours.

No more log rafts are to be permitted to go out from the Canadian seaboard forests. A fairly prohibitory duty has been placed on such enterprises at the instance of the owners of sailing vessels. This is parallel to smashing up machinery because it reduces prices and calls for less labor.

The timber-raft business has found its way into Europe. It is stated that a timber raft 700 feet long, 170 wide, carrying 170 men and worth $60,000, recently went down the Rhine; but it was nearly wrecked when passing the famous curve of the Loreiei.

The Harqua-Hala Gold Discoveries.

The Phœnix *Daily Arizonian* gives the following notes from the great gold discovery recently made in the Harqua-Hala mountains Every person returning from the district confirms the great value of the new discovery. The new camp is but three days' drive from Phœnix, and water is plentiful even in the dry season. Cochran and Davis have not yet started on their return to the camp, where they made five or six locations. A number of prospectors from Tombstone and several persons from Los Angeles are now here awaiting the abatement of the storm before starting to the new El Dorado. The mountain is about five miles in length, however, and the indications are that good mines may be discovered in any portion of it. Reports reached Phœnix yesterday that the Agua Fria was swollen so as to be unfordable, and that the Johnson-Riggen party were waiting at Elder's station until the stream should subside. They are bound for the new Harqua-Hala strike. The three owners of the original discovery are doing nothing in the way of developing their claims at present, but have realized already about $30,000, or $10,000 apiece. Parties are going to the new strike from all directions—from Yuma, Ehrenburg, Sentinel, Prescott and Phœnix. Sentinel station, on the Southern Pacific railroad, is the nearest point to the mines, but it affords neither provision, horse-feed nor teams. Besides this, the Gila river is unfordable at that point, and probably will remain so for a week or six weeks to come. After the storm subsides, Phœnix is the most available place of departure. Horses, grain and hay, supplies and provisions, are very cheap.

An enthusiastic miner writes from Harrisburg, Yuma county, to the Tucson *Star*: "I have seen a great many prospects, but I have never seen anything to compare with these. I have seen lumps of gold as big as a cup and half as big as my head. They have taken out at a low estimate $20,000 in lumps on one mine. They have a hole seven feet deep and seven feet square, and every pound that comes out will average $1 per pound. They have not struck top, sides nor bottom. Have picked up pieces of gold in going up the mountain. The dirt on the sides of the mountains will go from $1 to $10 per pan. Can find it wherever they have broken through the lime cappings. They have another mine about a mile from this. It shows up the same, and they have a big carbonate ledge on the same claim. The hole and mines show up fine. It is the biggest mine ever discovered on the coast. They say there are only about 15 extensions located."

A correspondent of the Yuma *Sentinel* is even more enthusiastic than the *Star's* correspondent. The former says: "The Gold Mountain claim is an immense body of extremely rich ore. Bowlders of float weighing from one to five tons are worth from $50 to $1000 per ton. We have picked up thousands of dollars in pure gold in pieces ranging from an ounce to over $200, the most beautiful specimens containing from $5 to $400 in gold; all this laid on the surface below the ledge, and in digging in the ledge we found the most wonderful rich ore hanging together with gold. For the last two weeks we have taken out every day very rich ore worth hundreds per ton. I have sunk down about ten feet and cut about that distance in the ore body, but found no walls yet. The Golden Eagle is also a wonderful rich mine. Cannot tell at present its full size. We have tons of ore from this mine sacked, which is worth from $500 to $1000 per ton. We have also found very rich carbonate of lead ore, running as high as 70 per cent; cannot tell at present the value of the gold and silver."

ACCORDING to the Eureka *Standard*, W. H. and S. F. Pine have applied to the Board of Harbor Commissioners for permission to build a wharf on the water front east of the east line of Carson's property. In conversation with W. H. Pine yesterday, he informed the *Standard* that it was the intention to build a new foundry and necessary building, as the present quarters are wholly inadequate to supply the present requirements of the trade, and the business is steadily increasing all the time. The wharf will be 80 feet on the water front and 100 feet deep, and a machine-shop 64x60 will accommodate all the machinery now on hand and that which is expected to arrive shortly. The foundry building will be 50x60 feet with plenty of floor. The pattern building will be two stories high, 32x40 feet. An engine is now being built with 10x18 cylinders which will furnish power. The foundry will have two cupolas, with a combined melting capacity of seven tons an hour. The contract to construct wharf and buildings has been let to H. M. Mercer and work will be commenced immediately. The improvements will cost over $7000, and the foundry when complete will be able to turn out any class of work.

De Lesseps and His Canal.

De Lesseps and his canal enterprise has for some time been recognized as one of the most picturesque figures in the world. No one thing has more largely occupied the world's attention for the past year than this great engineering effort to connect the two oceans at Panama. In a commercial point of view, it is fully equal in importance to the Suez canal. In an engineering light the work of connecting the Mediterranean with the Red sea bears no comparison to that required on the Isthmus of Panama. The Suez canal is a mere ditch through a sand plain, which was first conceived and completed some 2000 years ago. De Lesseps merely cleaned it out and created more substantial entrepots at either end. There were no engineering difficulties in the way which might not have been overcome by the merest tyro at such work.

Why even that canal should have cost $100,000,000 is difficult to explain, especially when nearly all the laborers were furnished by the enforced labor of Egyptian fellahs. Equally difficult is it to explain, especially in view of the much more magnificent engineering enterprises which have been carried to successful results in other parts of the world, why De Lesseps should have won such applause for his Suez work. The first American overland railroad, the canal and reclaiming system of Holland, the Erie canal through New York and other similar enterprises, exhibited much greater engineering skill than was called into recognition on the Isthmus of Suez. The first construction of that canal in the dim light of early history, when the world was young and science and engineering skill scarcely known, was a work of far greater magnitude than its modern renewal.

The Panama canal, neither in its conception nor in the engineering skill in its initiation, has been the work of De Lesseps. The proposition for its construction has been before the world for over 200 years, and its engineering possibility shown by actual surveys. De Lesseps has never been on the isthmus but once, and then only as the head of a junketing party. No special examinations were made, and no calculations as to the possibility, cost, or manner of the work.

De Lesseps has been simply a promoter of the scheme, without taking the trouble to give the work any serious consideration. He seems to have been peculiarly unfortunate in selecting men to let his contracts to superintend the work and to select and purchase machinery. Millions of dollars have been thrown away on machinery which, when placed on the ground at great cost, proved to be utterly worthless. Contracts have been so carelessly let as to give fortunes to the lucky contractors and pile up useless expenses against the enterprise. Stock and bonds have been sold at large discount and interest on the same paid from date, contrary to usual practice in such investments.

There has already been expended more than twice the sum which investors were assured would complete the work, and at least one-half more will still be required to finish the same. Money has been obtained under the most fraudulent assurances and expended in the most profligate manner. A large portion of this money has been drawn from people of small means who can ill afford to lose it. As the work took on a sort of semi-national character, these people, in their present calamity, naturally look to their Government to see that it is completed, so that their investments need not be an entire loss. And right here stands a lion in the way—the Monroe Doctrine—under which no European nation can be allowed to acquire any local national rights on this continent. The French Government would gladly step in and finish the work; their people demand it; but they dare not do so. They remember Maximilian and his fate. It would not do for the Government to take charge of and complete the work without establishing a government protectorate over it. That cannot be permitted by the United States.

De Lesseps' last remaining hope was taken away when Senator Edmunds introduced his late resolution into the U. S. Senate stating that this Government would look with serious disapproval upon any European government which should undertake either the control or *construction* of any ship canal across the Isthmus of Darien.

It would seem under existing circumstances that the Government of Colombia should apply to the United States for aid to complete the canal. Either some such plan must be adopted, or the canal company must raise the remaining funds required in its civil capacity. Neither the French nor any other European Government will be allowed to step in and take up the work.

Bitter denunciations are heard among the French investors in regard to what they consider the mismanagement of the affairs of the company. The most of those who have discussed the matter feel kindly disposed toward De Lesseps, commiserate the misfortune which has overtaken him, and still have hope that his fruitful brain will find some satisfactory way out of his present dilemma. The canal will most undoubtedly be completed; but in all probability the money already invested will be mostly lost. Whoever puts money into the scheme at this stage of the enterprise must be protected, whatever may befall previous investors.

Coast Industrial Notes.

THE Idaho *Register* says: Ogden parties are contemplating a flouring-mill on the Burgess Canal, about 15 miles from town. Mr. Burgess has agreed to give them all the water required. It will be a roller-mill. This will be a great convenience to the ranchers of that section of the country.

THE Gig Harbor Sawmill Co. has commenced operations at Gig Harbor, Puget sound. A boom of 500,000 feet logs has been received. Wharves will be constructed to berth eight vessels. The mill cutting capacity will be 100,000 feet daily. George Atkinson, late of the Tacoma mill, is in charge of the new enterprise.

THE Cottaneva Lumber Company are building a new chute at their shipping-place at Rockport, Mendocino Co. This chute will run from the rock at the outer end of the bridge at the same place as the old one, but will be longer, and will point in a little different direction, so as to reach deeper water.

THE Atlas Coal & Coke Company was incorporated at Tacoma Dec. 14th with a capital of $250,000. The company expects to go into the coke-making business on a large scale. It is proposed to erect 50 ovens at Wilkenson in which to prepare the coke. The Port Gordon is now on the way with 1000 tons firebrick for the construction of these ovens. The company is encouraged to expect a good demand for its product from Idaho and Montana. Formerly foundrymen and blacksmiths were about the only customers for coke, except a comparatively small quantity used in ranges. The product of the local gas companies is usually sufficient for house purposes. We get most of our foreign coke from Wales. There is occasionally a small consignment from Australia. Whole cargoes are sometimes received from Cardiff. Our imports from 1884 to 1887 were as follows:

	Tons.		Tons.
1884	10,695	1886	26,293
1885	20,611	1887	22,657

These totals show an average of 20,000 tons per annum. Our imports of foreign coke for 1888 to date have been as follows:

	Tons.		Tons.
January	3,711	July	910
February	——	August	1,443
March	1,102	September	2,322
April	1,122	October	1,162
May	818	November	560
June	1,744	December	800
Total			16,600

The light imports for the year have caused prices to rate high, especially of late, spot lots being quoted as high as $20, while for lots to arrive next year the best offers are $13 to $14. Small consignments of Puget Sound coke have come to hand from time to time throughout the past year, but the supply is certainly inadequate to the demand. The gentlemen connected with the new enterprise to be known as the Atlas Coal & Coke Co. have canvassed the field, and believe there is a good business in the manufacture and sale of coke at Wilkenson, W. T.

GOVERNOR WATERMAN is in receipt of a letter from Colonel McDonald, United States Fish Commissioner, relative to fish matters in this State, as follows: "You are of course aware that the United States Fish Commission has resumed work upon the McCloud river, with the specific object of collecting the eggs of the California salmon and hatching out the fry for distribution to the salmon rivers of your State. This work is undertaken in view of the important economic addition to the food resources of that part of the country. It is believed that this work may be conducted upon such a scale as to restore and maintain the salmon in their former abundance in all of your rivers. It is desirable, however—indeed, it is essential—that the work of the United States should be supplemented by such regulations as will permit the salmon to ascend the river in sufficient numbers to furnish the eggs for artificial propagation. This would involve the regulation of times and modes of fishing by law, and the prohibition of the introduction of sawdust and other material into the rivers, which would either directly pollute the waters, or by accumulating upon the natural spawning-beds of the fish destroy these, and make the maintenance of the fishery dependent entirely upon artificial methods. I bring this matter to your attention with a view to awakening public interest and discussion, in the hope that when the conditions for the permanence of so important a fishery are well understood your Legislature may be induced to enact the necessary laws for their protection."

THE efforts of the Southern Pacific Company to secure a good supply of water by sinking wells in the Southern California desert in the vicinity of Indio, a station on the line in San Bernardino county, have been attended with many discouragements. Little doubt is felt in the minds of the well-borers, however, that the sinking of these wells will in time be perfectly successful if the right kind of machinery be used. George Durbrow of Dalton, in the southern part of the State, has mounted an artesian plant which he thinks will render the work more efficacious than that prosecuted with ordinary boring machinery. Mr. Durbrow has charge of the Southern Pacific well-boring on the desert, and he is familiar with all the details of the work, knowing its requirements, and therefore feels well qualified to construct a machine that will prove successful in its operations. He sank one with the old machinery 756 feet and struck a stream of water that flowed 18,000 gallons an hour. Not satisfied with this, the railroad people wanted a still better flow, and ordered the well to be sunk deeper, and while that was being done the inside casing became filled with sand and has remained so ever since. Alternate layers of sand and clay were found in this well all the way down, with occasionally a little gravel. At 16 feet good surface water was reached, and at 100 feet the first flow of artesian water was struck, but this only came to within 13 feet of the surface. Indio is 20 feet below the sea level, and is considered for that reason a very good point at which to sink artesian wells.

THE North Pacific whaling fleet did only moderately well for the season of 1888. The best return was made by the steamer Orca, which reported 1700 barrels oil and 35,000 pounds bone. This steamer also made the best return in 1887, namely, 2800 barrels oil and 48,000 pounds bone. Most of the other steamers did tolerably well, the Bælena reporting 1000 barrels oil and 14,000 pounds bone. Some of the sailing vessels reported 10,000 to 14,000 pounds bone, with a corresponding amount of oil, but most of them reported less than 10,000 pounds bone. The oil and bone returned by the fleet of 1888 was consigned as follows:

Name.	Vessels No.	Oil bbls.	Bone lbs.
Pacific Steam Whaling Co.	7	5,161	79,000
Wright, Bonne & Co	9	1,282	42,200
Wm. Lewis	8	3,265	59,400
James McKenna	4	1,400	32 500
Aiken & Swift	2	1 840	26 900
J. & W. R. Wing	4	1 550	14 200
Mage & Moore	2	350	3,500
I. H. Bartlett & Son	2	550	7.500
G. Allen	1	240	4,500
J. N. Knowles	1	250	4,000
N. C. Eldridge	1	...	2,000
Order	1	215	.....
Totals	42	16,093	275,700

In addition, five of the vessels brought 14,700 pounds ivory, of which the steamer Narwhal was credited with 10,000 pounds, and the schooner Allen with 4000 pounds. Prior to 1879, most of the North Pacific whaling fleet refitted at Honolulu, but since then nearly all have come here to discharge and refit. From 1864 to 1873, both years inclusive, the receipts of whale oil at San Francisco amounted to 114,711 barrels, the largest quantity for any one year in that interval being 18,940 barrels. From 1874 to date, the fleet reporting at San Francisco has been credited as follows:

	Vessels No.	Oil bbls.	Bone lbs.	Ivory lbs.
1874	11	10,600	86.300	7,600
1875	12	16,300	157,000	25,400
1876	7	2 800	8,800	7,000
1877	20	13,900	139,600	74,000
1878	21	9 600	73.300	30,000
1879	22	17 400	127.500	32,900
1880	20	23,200	339,000	15,300
1881	26	21,300	354,500	15,400
1882	30	21 100	316,600	17,300
1883	37	13,300	160,200	23,100
1884	40	20 373	295,700	5,421
1885	43	30,143	448,075	7,066
1886	43	20,661	332,931	5,273
1887	41	32,884	603,400	550
1888	42	16 093	275,700	14,700
Totals	416	269,154	2,918,606	281,510

The fleet for 1889 has already begun to leave the port. The early vessels first cruise to the south during the winter months, heading in the spring for the Arctic ocean.

SOME improvements and novelties have been introduced in the new cable-railway system of Los Angeles. The work was begun under the presidency of John F. Crank, but a Chicago company now has control of the enterprise, though it is still headed by Mr. Crank. The system will be most complete in its various ramifications, being fully 18 miles in length. The main line will run from East Los Angeles, along Main and Spring streets, to a point beyond Washington Garden. Work is now being pushed as fast as men and money can do it, and it is likely that the lines will all be completed and cars running over them by February 15th. There are now being built in this city two pairs of engines to be used as a part of the power for pulling the cable. The engines will be of the compound type, using the steam expansively. A Chicago firm is building a third engine of the same kind, which will be used by the company. The boilers will be equipped with mechanical stokers.

EMPLOYER AND EMPLOYE.—There are certain rights existing between employer and employe, which both are bound to respect, and it is only when there is a breach in these that there is any cause for trouble between the two parties. And when once this rupture occurs, it is very apt to be widened by the feelings and words that naturally arise. The greatest cause for trouble often arises on the part of the employe; and, in endeavoring to vindicate himself, he forgets that there are others, whose rights are equally important and just with his own. More caution and less hotheadedness on both sides would often avert what otherwise proves a break in the pleasant relations that should always exist between employer and employe, and without which neither realizes or enjoys the full share of profit, which is his just due.—*Practical Mechanic.*

The English Watch Industry.

An interesting illustration of the capabilities of the English watch trade as a manufacturing industry has recently been brought to our notice. As it will serve to show our readers abroad how unfounded are the statements often made that "no such thing as an entire English watch" exists, we give the following particulars of the instance referred to: When the committee appointed by the House of Commons were taking evidence to guide them in revising the clauses of the Merchandise Marks bill of 1887, they were informed, as the public have also been so frequently told, that it was impossible to make watches in England without the assistance of foreigners, or imported parts of watches, especially complicated watches, such as perpetual calendars, repeaters and chronographs. Upon hearing this statement, Captain Penton of the House of Commons communicated with Mr. S. A. Brooks, the chairman of the London Watch-Trade Association, to verify the assertion. Mr. Brooks consulted a firm of watch manufacturers who took great interest in the Trade Marks bill, and one member of which has given evidence before the committee.

In the result Captain Penton was informed that complicated watches could be made entirely by Englishmen, and on receiving this reply he gave an order for two watches—a gentleman's and a lady's—the former to be a minute repeater and perpetual calendar, and the latter a minute repeater. The order was placed with instructions to make two of the finest watches which could possibly be produced, and of English workmanship throughout. Recently they were completed and delivered. Both have fusee-movements in massive cases. The larger is a full hunter; the other a sight or half-hunter. Both are keyless, the keyless work, repeating work and perpetual calendar having all been made by English workmen. The watches are beautifully jeweled, with finest finished, double-cup trumpet-holes to escapement, the fusee-holes being of sapphire solid stone pipe, out out square and set in steel. The cases are richly enameled with arms, crest and monogram in appropriate colors, and the lady's watch has a wreath of forget-me-nots and lilies of the valley enameled round the circle of hours outside the case, and a spray of moss roses on the dial, which shows through the opening of the sight-hunter. It would be difficult to find two more splendid and elegant examples of English workmanship, and Clerkenwell is to be congratulated that it has manufacturers public-spirited enough to take up this complicated branch of the watch trade, and thus to resuscitate one of the oldest London industries.—*English Paper.*

THE PERUVIAN NITRATE DEPOSITS.—Along the Peruvian coast, stretching for hundreds of miles, are the famous beds of nitrate of soda, which purified is saltpeter. These deposits, more profitable than silver or guano, were discovered accidentally by a vagrant Englishman named George Smith, but were not operated to any extent until recent years. Now, nitrate, having been found a valuable component of a hundred chemical forms, is in demand the world over, and millions of dollars' worth is shipped from the ports along the coast annually. Before its value was fully known, a number of far-sighted men located "claims" after the fashion in vogue in mining camps everywhere, and then the Government stepped in and forbade any further pre-emption. But the original locations cover enough of the deposit to supply the market a century or two, and to keep up the prices they have formed a pool, a monopoly combined, under which they charge from $2 to $3 per hundred weight for what costs them about 15 cents. There is apparently no limit to the stuff, the bed stretching up and down the coast for 300 or 400 miles.

RESIN ON THE BRAKE.—The Gould and Curry boys who are running cars on top have quite a grade to run on from the works to the dump. They have brakes on their cars, and ride down at a good jog, but often it is difficult to restrain the car by applying an iron brake against an iron wheel. To give more power to the brake, they have used sand, which worked pretty well, but Joe Blakely, day before yesterday, tried to improve upon sand, and stealing Zimmer's resin, he applied it liberally to the brake of his coach. Gathering an audience around him to see how it worked, he set sail for the dump. The iron heating melted the resin and made a fine lubricating oil, and Joe sailed like a shot. He struck the stopping-post and the car stopped and immediately changed its shape, and Joe went on down the dump like a mass of pork. The audience brought the pieces to town and had them carefully sewed together, and hopes are entertained that Joe will be himself again in time to accept a deputyship.—*Virginia Enterprise.*

THE San Diego *Sun* says: The Gold King mine, near Julian, is looking remarkably well. At 70 feet from the surface the vein is 12 inches wide, and the ore runs as high as $60 to the ton.

WHERE a heater is used, a pump is more economical as a boiler feed than an injector; but an injector is always preferable where there is no heater.—*Safety Valve.*

THE Carson *Tribune* says there are more idle men in Virginia City than for many years, and every business man is complaining of hard times.

TABLE OF CONTENTS.

EDITORIALS.—The Gibbs Camera; British Columbia Mines, 21. Passing Events; Academy of Sciences; Greenstone; Oil Fuel for Mining Plants, 24. Smith's Automatic Oiler; Photographic Results, 25.
ILLUSTRATIONS. — The Gibbs Camera, 21. Smith's Patent Automatic Oiler; The Inner Corona; The Outer Corona, 25.
CORRESPONDENCE.—Amador County Mines; Calaveras County Mines, 24.
MISCELLANEOUS.—Our Lumber Interests; The Harqua-Hala Gold Discoveries, 22. De Lesseps and His Canal; Coast Industrial Notes; The English Watch Industry, 23. Electricity and Plant Life, 27.
MECHANICAL PROGRESS.—Imperfections in Tin Plate; How Sheffield Cutlery is Made; Is the Planer a Necessity; Tube-Making as a Lost Art; Three Hundred Miles an Hour by Railroad; Ten-Inch Steel Target Penetrated, 26.
SCIENTIFIC PROGRESS.—Oil on the Waters as a Preventive of Fogs; The Mysteries of Vision; Terrible Volcanic Disturbance; The Duration of Lightning Flashes; When are Petroleum Vapors Explosive; Poteline; The Resistance of Snow to Projectiles, 28.
USEFUL INFORMATION. — Feather-Bone: A Peculiar Industry; A Plumber's New Trick; The Flow of Liquid Through Pipes; Varnish from Sugar; A Long Line; Draft Over Different Pavements; Use for Oily Ropes; Metallic Pens Not of Modern Invention; For Removing Old Varnish, 27.
GOOD HEALTH.—Points About Pneumonia; How to Breathe When Reading; Different Phases of "Mind Cure;" Effect of Petroleum on the Human Body; An Ill Turn, 27.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 28-9.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 32.

Passing Events.

The mining excitement just now prevailing is at Harqua Hala, not far from Phœnix, Arizona. A great many miners are leaving for the district, and very rosy reports are received concerning the mines. However, thus far only one "ledge" has been found, and the owners are trying to sell that, although they took out $20,000 in sinking a few feet.

The results of the observations of the solar eclipse of last week, so far as known, are very satisfactory, especially in the matter of photographs. During this week many of the Eastern observers have been in San Francisco, and all express themselves well pleased with the results they were able to accomplish.

The ore resources of the Con. Cal. and Virginia mine on the Comstock are marvelous. During the past two years over 300,000 tons has been extracted, producing above $7,000,000 in bullion. Notwithstanding this tremendous drain, the mine is now still yielding a daily average of 400 tons of ore, the area of which is added to by frequent new discoveries in advancing explorations.

Prof. Pickering of Harvard is here and will soon go to Los Angeles, in pursuance of an arrangement with the University of Southern California to make a study of Wilson's Peak, upon which it is proposed to construct a greater telescope than the famous one on Mount Hamilton, that under consideration to have a lens 40 inches in diameter, while the Lick lens is but 36. At Wilson's Peak, Prof. Pickering will mount a 16-inch telescope, with which he will make observations to test the conditions. He is also to find a suitable location to place a 24-inch telescope for astronomical photography.

Greenstone.

Many of our mining men use the terms greenstone and diorite as if they were totally different rock, which in many cases is misleading.

Greenstone is an old and well-known name, a translation of the German "Grunstein" and may be taken as synonymous with the French diorite. It consists of a mixture of feldspar and hornblende, and varying in texture from fine-grained compact rock in which the crystalline state of the minerals is barely discernible with a lens, to a coarsely crystalline aggregate—color dull green, varying from light to dark green or almost black.

In Mr. Frank Rutley's little work on the "Study of Rocks," under the head "Diorite Group," he says: "The term 'Greenstone,' which in its older signification embraced basalt, diabase, gabbro, diorite, etc., has subsequently been restricted in its application, and employed as a synonym for diorite. Since, however, the name greenstone is almost meaningless, it seems desirable either to discard it, or still better, to use it in its original sense as an ambiguous and comprehensive term, useful in field geology, but otherwise only admissible as an expression of comparative ignorance, such as may safely be employed in the case of rocks of a certain type, which have reached so advanced a stage of decomposition, and in which the constituent minerals are so poorly developed, that it is no longer safe or possible to hazard any opinion concerning their precise normal mineralogical constitution."

"Diabase" may be regarded typically as a crystalline-granular admixture of triclinic feldspar and augite, usually with more or less magnetite and titaniferous iron. Some of these rocks contain quartz and they are consequently divided into quartz diabase and quartzless diabase, or diabase proper. Chlorite has hitherto been cited as one of the essential constituents of the rock; but Rosenbusch very justly observes that if the chlorite matter in diabase be, as it no doubt is, a secondary alteration product, it then has only a "pathological significance," and cannot therefore rank as an essential constituent. That the viridite (chlorite, spichlorite or chloritic matter) in diabase is a product of alteration is an opinion now very generally held.

The term "porphyry" is applied by many of our mining men to nearly all igneous rocks except granite. Now the term "porphyry" without addition or qualification denotes par excellence "quartz porphyry," a rock with quartz-felsitic base, and crystals of feldspar and quartz in acid rock containing from 70 to 80 per cent of silica.

"Wache"—"Greywacke" (Ger. gruwacke) is the name given to a somewhat decomposed state of igneous rocks, poor in silica. The mass is soft, almost earthy, of a brown color, its mineralogical structure quite unrecognizable, and only to be traced by transitions from the fresh state of the original rock. Such rocks are designated "wackenitic," as wackenitic dolerite, etc.

Academy of Sciences.

The annual meeting of the California Academy of Sciences was held on Monday evening, the election being held during the same day. H. W. Harkness was elected president, defeating George Davidson, who headed the opposition ticket. The following officers were elected: H. W. Harkness, president; H. H. Behr, first vice-president; Geo. Hewston, second vice-president; F. Gutzkow, corresponding secretary; J. R. Scupham, recording secretary; I. E. Thayer, treasurer; Carlos Troyer, librarian; J. G. Cooper, director of museum. Trustees—C. F. Crocker, D. E. Hayes, S. W. Holladay, G. C. Perkins, E. J. Molera, Irving M. Scott, John Taylor.

By 8 o'clock there was a large attendance of members. Dr. Harkness called the meeting to order. The treasurer made a report of the financial transactions of the academy during the past year. The rent of the Market street property amounted to $4671, and $1183.50 was received from dues and $1200 from interest. A loan of $5000 was also received from the Lick trustees. There is on hand in the general fund $2185 04; in the current expense fund, $2936.06; Crocker fund, $751.

The librarian reported 2647 publications made during the year and 651 volumes completed.

Curator Bryant of the department of mammals and birds made an interesting report, stating that his department was in a bad condition. He had prepared a plea to sportsmen and others for fresh subjects, which, however, had not been published, because if the subjects were received there was no place for them.

C. F. Crocker, president of the Board of Trustees, also made a report, reviewing the action of the trustees in relation to the Market-street and First-avenue property of the academy and the new academy building.

After President Harkness had presented his report, in which he made a general review of the work of the academy for the year, Mr. Stevens presented the report of the Election Board. Dr. Harkness declared the regular ticket elected and the meeting adjourned.

Oil Fuel for Mining Plants.

In view of the suits instituted by the Government against mining companies in this State and Nevada to recover value for timber used by them for fuel and mining purposes, it is probable more care will be used in future as to sources of timber supply. It is possible that in some instances the privilege of cutting wood on the public domain has been abused, though there is a general feeling of indignation in the mining community at the commencement of the suits. In most cases no other fuel except wood is available in the mining districts, and nothing but wood can be used for mine "timbering," but in a few instances oil is being used for fuel. The Silver King Co. of Arizona has gone to considerable expense in this connection. In well No. 2 the main addition made last year to the plant has been the erection of a new engine, and the institution of a complete system for the transportation and consumption of crude oil for fuel. The scarcity and increasing value of wood has made the fuel question so serious that a change was imperative. Experiments in 1887 showed coal to be entirely too expensive, and attention was directed to the use of oil. The first requisite to make its use as economical as wood under the old conditions, was a condensing engine. This was obtained from Messrs. Fraser & Chalmers, being a vertical compound-condensing engine of 175 horse power, twin cylinder pattern, and Corliss gear. It was put in motion, replacing four high-pressure engines formerly in use, proving most economical, a test under conditions of disadvantage to the new engine, showing a saving of 28.38 per cent in fuel over previous consumption.

Following the completion of the engine, the necessary arrangements for the use of oil were made. At Casa Grande, the railroad point, 800 feet of trestle, with double-inclined approach, was built on embankment adjoining the main S. P. railway track. Adjacent to and below level of the trestle, two storage-tanks of combined capacity of 11,000 gallons were located. At a still lower level the transportation wagons come in and receive the oil through piping, the entire arrangement of unloading cars and loading wagons being by gravity.

The oil is carried in wagon-tanks of 1000 to 1300 gallons capacity to the mills, where they are discharged by pipe line to three storage-tanks of 14,000 gallons capacity, which are located across the creek from the mills as a matter of safety. From the storage-tanks the oil passes by gravity to a supply-tank and pump which forces the oil directly to the burners. The working of the system has been most satisfactory, and the fuel cost as low as formerly, so that the mill-work is now independent of a future scarcity of wood, and any interference from the Government in the matter of fuel.

Wood, being cheaper at the mine, is still in use, the year's consumption amounting to 3711.57 cords at No. 1 shaft, and 1008.77 cords at No. 2 shaft. The mill fuel consumed included 3441.35 cords for steam, 360 cords at the lower creek pumping station, 592.4 cords for roaster and drier work, besides 496,500 pounds of oil used the latter half of the year at the boilers.

A LARGE CASTING.—On Monday last the huge stern-post of the war vessel San Francisco was cast at the Pacific Rolling Mills. At 2:30 the furnace containing the liquid metal was tapped and 29,000 pounds was poured into the hot pot. When the stream ceased, and the huge pot was filled, it was moved along a truck until the bottom was over the mouth of the mold, when the casting was completed.

The Gibbs Camera.

(*Continued from page 21.*)

it then lies and is supported directly and firmly upon the back lid, *C*, which has been turned forward to serve as a bed, as heretofore described. In this position the front plate serves as a focusing platform. In order to hold it solidly and firmly in this position, Mr. Gibbs makes use of the pivoted latch *E* of the back lid, causing it to engage a catch in the front lid *G*. This engagement, though it may be of any suitable character, is here shown as being made by a slotted plate, *H*, with which the notch of the latch engages, and is pressed thereto by a spring-actuated toe-piece operating behind the slot. The engagement is, therefore, automatic, and the disengagement is effected readily by pressing back the latch to relieve its notch of the slotted plate.

The inner surface of the front lid *G*, which becomes the upper surface when said lid is laid down, carries the tracks *I*, upon which the front of the camera is drawn out for focusing, its adjustment being effected by means of the common device of the pinion shaft *J* and racks *j*. Instead, however, of this simple form of adjustment, Mr. Gibbs uses, especially in larger cameras, the following construction: Upon the tracks *I* is mounted and adapted to slide a carriage frame, *K*, having on each end the guides *k*, upon which the base of the front-board of the camera is mounted, and is adjusted by means of the pinion shaft *J* on the camera and the racks *j* on the carriage frame. In the inner edges of the tracks *I* are made notches *i* at intervals, and upon the front of the carriage frame are arranged the spring-controlled oppositely-working sliding latches *L*, the ends *l* of which are adapted to engage the notches *i* of the tracks in order to hold the carriage frame solidly in position. The latches are readily operated by means of adjacent thumb-pieces *l'*.

Now it will be seen that this construction provides for the primary or general adjustment of the bellows by pulling out the carriage-frame *K*, with the front board and lens, to about the focus, as near as can be judged. Then the more accurate adjustment, while focusing, is effected by the pinion shaft operating on the racks *j*. This effects a saving of time over the ordinary method, and where the work being done requires the same focus the carriage may be drawn out directly to that focus at once and held by the spring latches. *M* are safety stops on the carriage-frame for limiting the adjustment of the camera front on said frame. By thus having the tracks on the front plate *G*, the inventor avoids having a separate track-frame such as is usually employed.

P is the finder of ordinary construction used in instantaneous work, etc., for getting the image in the proper place on the plate. Mr. Gibbs' improvement in this connection consists in means for mounting it, whereby it may be turned to position for a vertical or horizontal picture. It has secured to one of its sides a plate *p*, which is pivoted at *p'* to a plate or arm p^2, which is itself pivoted at p^3 to the camera front-board. The edge of the plate *p* is cut out to form terminal shoulders at p^4, which, by coming in contact with a fixed pin p^5, in the arm p^2, limit the movement of the finder in either direction, and hold it in either a vertical or a horizontal position as it is turned on its pivot at *p'*. The turning of the arm p^2 on its pivot moves the finder down to be inclosed by the case or up above said case for use.

In a camera, the focusing of which is effected by the backward movement of the bellows, it is only necessary for the manufacturer to reverse the lids *C* and *G*, making the former the front lid and the latter the back one.

It will be seen that by the construction of the camera as described, Mr. Gibbs provides what may be termed a "self-contained" apparatus—that is to say, there is no necessity of a separate case or box. The parts of the apparatus which are necessary for setting it up preparatory to its use are parts of the inclosing box or case and have the double function described. There are no separate pieces to be mislaid or forgotten, no pieces to shake loose or rattle; but the apparatus as a connected whole is complete in itself whether in use or closed up. The construction of the "box" is such that the lens is at all times in position on the front board. It is thus in a safe carrying-

place out of danger of accident of any kind. Its permanent position causes a saving of time in setting up the camera for use. This is intended for a serviceable outdoor camera, which can be carried in a wagon, the cars, or on a boat without danger of breakage.

Quite a number of these cameras have been made here and are in use. They are very compact and convenient. The improved instrument is the result of several years' experience with cameras in outdoor work, during which time the inventor has been able to see the defects in the ordinary "boxes" and the inconveniences arising therefrom.

Smith's Automatic Oiler.

Some little time since, J. T. Smith of this city patented through the MINING AND SCIENTIFIC PRESS Patent Agency an automatic oiler for machinery, shafting, loose pulleys, wrist-pins, etc. The wool packings and spiral spring within the tube regulate the flow of oil; by the use of the thumb-screw on the top end of the tube the packing and springs within can be compressed or slackened as required, so as to supply the required amount of oil where they are used. The cups, when properly filled, will with one filling last many months. This automatic oiler feeds oil only by the revolution of the machinery. Numbers of these oilers are now in use in this city and elsewhere in mills and factories and have given excellent satisfaction, saving oil and keeping bearings cool and well lubricated. They only feed when the machinery is in motion. It is also adapted for oiling axles of trucks and all kinds of vehicles.

Several different styles of these oilers are made to meet special requirements. The cuts given herewith show some of these forms. Fig. 1 is a plain oil cup, with tube in center, the end of which is given as resting lightly on bearing or shaft. The filling in the interior represents the wool-packing and the spring, these being compressed by the thumb-screw, which regulates the supply of oil as required.

Fig. 2 is a plain oil cup with the tube on the side. This is so as to allow it to enter where the oil-hole is near some obstruction. The packingland spring are the same as in Fig. 1.

Fig. 3 shows the tube alone, with thread on top and outside, the cap screwing down with the thread on the interior of tube. This oiler is used expressly for oiling the axles of vehicles, and screws down flush with the outside of the hub. With one filling it is claimed this will oil an axle for from one to two months.

Fig. 2 *B* is glass, mounted with brass, and represents a cup to be used on a steam engine. The conical-pointed stem passes through the spiral spring and penetrates the wool packing below. The object of this is to hasten the flow of oil. In case of necessity, by turning the screw back the conical point of the stem will leave a space in the packing by which the oil flows quickly.

Fig. 4 shows a long tube with an interior compressing tube. The object of this is to conduct the oil through any length of tube to the required spot. The tube in the interior, pressed by the thumb screw above, will compress the packing in bottom of tube and regulate the flow of oil the same as though the tube was short.

Fig. 5 shows the loose pulley cup, ready for use, with thread to screw into hub of pulley, the end of tube touching the shaft, as in all other cases. The packing is the same as in Figs. 1 and 2.

Fig. 6 represents a brass engine cup with the interior arranged precisely as described in Figs. 1 and 2 or in Fig. 2 *B*. These oilers are manufactured in San Francisco by J. T. Smith & Co., 31 Commercial street. State rights in the patent will be sold or the oilers themselves can be purchased. Hundreds can be seen at work in the principal cities in California and at the mills in Minneapolis, Minn.

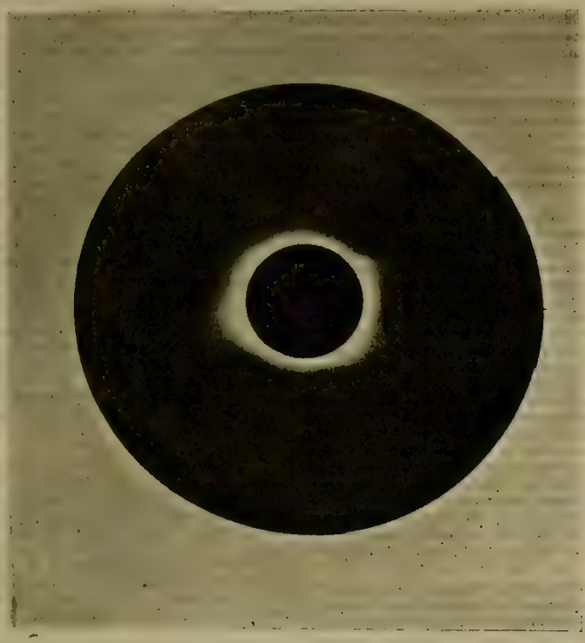
Photographic Results.

Although all the negatives have not yet been developed which were made by the photographers during the recent solar eclipse, enough have been to show that marked success has been made. The largest are those made with the 13½-inch refracting telescopic camera of the Harvard Observatory party. They are excellent and show much detail. The Pacific Amateur Photographic Association made in all 164 negatives, many of which have been developed. The largest made by any of this party were those of Mr. Burckhalter of the Chabot Observatory. His images are thirteen-sixteenths of an inch in diameter. He worked with a camera made from a 10½-inch reflecting telescope, so the plates are necessarily somewhat "fogged," but not enough to spoil them.

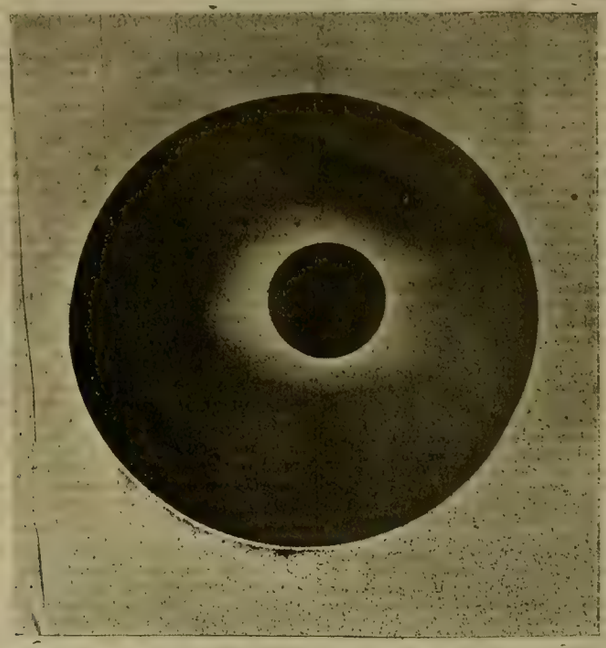
We give on this page two cuts made from prints of the corona during the total phase of the eclipse. Some detail is necessarily lost. In fact the "prints" from the negatives are by no means as good as the negatives themselves, showing less detail in every way. The long fine rays or wisps of light which show plainly in the negative are more or less lost or become confused in one mass of the prints.

Long since Prof. Langley thought that he saw with the eye that these wisps or rays of light of the corona were each formed themselves of closely-lined wisps, and he has been anxious for some proof of this. The negatives made show plainly that he was right in his theory. The outer ends of the outer corona are so fine that they scarcely show in the prints, though plain in the negatives.

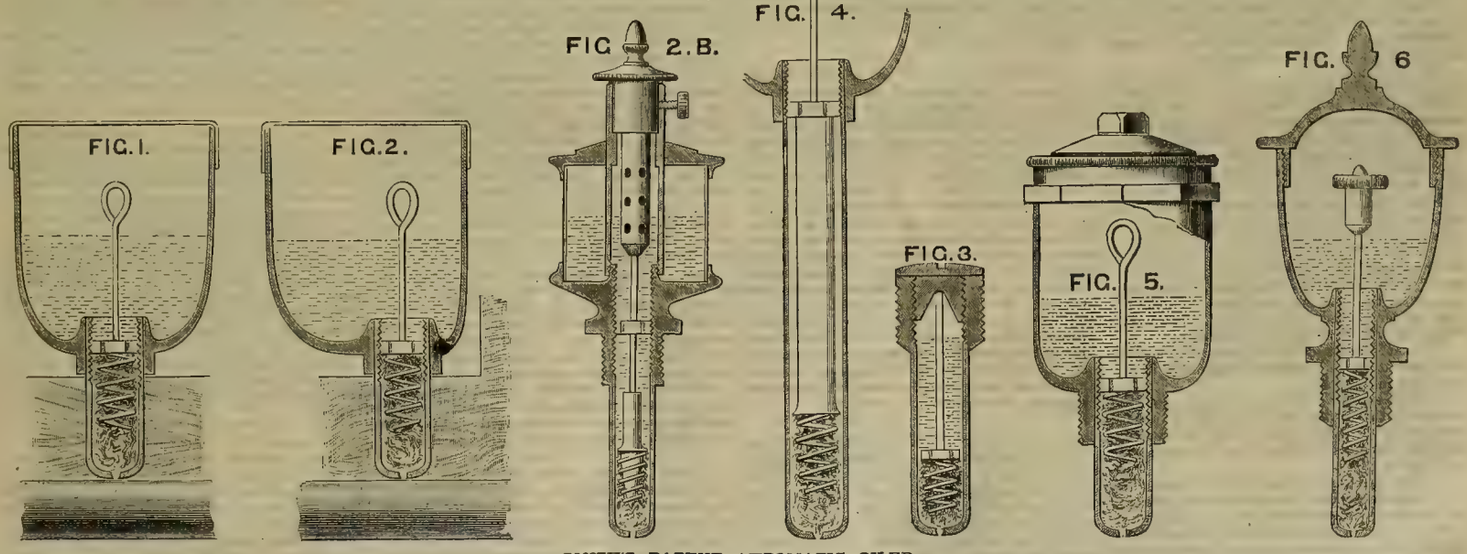
The experts in the photographic ranks conclude from their experience that the plates should be exposed for different lengths of time on inner and outer corona. That is, one that will be correct for outer corona will not be for the inner, and vice versa. The best general result will be given on a quick plate exposed for three seconds. When the comparative sensitometer tests are completed, after the occurrence of the next full moon, the exact photographic value of the light of the corona will be determined, which will be of value to future observers. Careful records of the exposure, etc., of each negative made have been kept by the observers, so that when all are collected and compared deductions can be drawn which will simplify the photographic work during future eclipses. Photography never played so important a part in an astronomical event as on this occasion.



THE INNER CORONA.



THE OUTER CORONA.



SMITH'S PATENT AUTOMATIC OILER.

THERE is talk of introducing the Russell process on the Comstock.

MECHANICAL PROGRESS.

Imperfections in Tin Plate.

All persons who are familiar with tin plate must be aware that very soon after use, and not infrequently before use, distinct black spots, as of rust, appear at various points on the surface. These spots are not only unseemly in appearance, but are points where small holes are apt to appear. These holes are sometimes infinitesimally small, but sufficient to work great damage and loss, especially in canned goods, and the importance of preventing their occurrence cannot be over-valued. It has been stated that "a plate which could be guaranteed free from black spots would command the maker's own price." It is very generally acknowledged that this defect is becoming more and more prevalent.

The cause of the appearance of these spots has long been a matter of serious inquiry. The United States being the chief consumer of tin plates, their quality here is a matter of very great importance, and the trade of this country has been especially earnest in a study of the phenomenon, but hitherto with but little satisfactory result.

The subject has recently been taken up by Herbert S. Sutton of England, who read a paper descriptive of his investigations before the late meeting of the Swansey Society of Mining and Metallurgical Industries. In that paper he says: "Considerable diversity of opinion has prevailed as to the cause of 'black spot,' one manufacturer holding it to be due to some condition in the tin used, another to the acid used in the 'pickling,' by others it has been attributed to the grease employed in the initial stage of tinning, and by some to a sort of galvanic action set up during railway and other transit of the finished plate. The opinion I have formed is that it arises from neither of these, but that it is the result of an element in the iron out of which the plate has been made."

The same writer describes the defect as follows: "A box of tin plates, after passing usual scrutiny of the assorting-room, may be sent out, properly packed in a dry box, and even with sheets of tissue paper between each plate, yet, on reaching its destination, although the journey be a short one (I know a case in which the journey was only 12 miles by rail), on being opened will often present on the surfaces of many of the plates a small spot about the size of a pin's head, and sometimes larger. As a matter of mere appearance, these markings might possibly in many cases be of little importance, but on examination it is found that they are due to the fact that the tin coating which had covered them is gone, and that a certain element upon the surface of the iron of a dark color is exposed. This is black spot. The tin being removed, oxidation of the iron soon begins, and what might have been disregarded as a mere matter of appearance soon becomes a hole, which vitiates the article wholly."

Mr. Sutton in the course of his investigations claims to have obtained the positive result that the cause of the black spot was the presence of a foreign body, which became incorporated in the iron in the course of production, to which the tin would not adhere, and was in no way superficial or upon the tin coating as has been asserted. He says: "I found this body to be of a graphitic nature, which may generally be described as a compound of carbon, silica and iron, and of a very infusible nature."

Mr. Sutton continues: "It is a known fact in metallurgy that graphite can be artificially produced, and it is certain that both in the smelting of iron ores and in the treatment of metallic iron this element *is incidentally produced*. If the graphitic element which I have indicated be the producing cause of black spot, and, further, if it be attendant upon the production of pig iron as well as in the manipulation of it for tin-plate purposes, the question fairly arises, Did it occur when cold blast iron was used? We will take the cold blast iron to be the type of the highest quality, especially if made from argillaceous ironstone. So far as I can learn, the ores produced from this class of iron are not subject to black spot." The writer winds up with the following summary:

1. That black spot in tin plates is caused by the presence of a graphitic compound in the iron forming its body.

2. That the tin coating of the plate does not adhere to the surface offered by this compound, but is merely carried over it by its own continuity, and readily breaks away by concussion or friction.

3. That the graphitic compound is producible, and no doubt often is produced in the smelting of iron ores and the manufacture of pig iron.

4. That it is also producible in the manufacture of tin plates when the pig iron employed is subjected to great heat in connection with siliceous or impure fuel.

5. That its formation is less frequent in the methods by which steel bars are made, and that when it does occur herein it is probably due to the use of pig iron in which it has been primarily produced in the blast furnaces.

THE OLDEST PIECES OF WROUGHT IRON now known are probably the sickle blade found by Belzoni under the base of a sphinx in Karnac, near Thebes; the blade found by Colonel Vyse, imbedded in the masonry of the great pyramids; the portion of a crossout saw exhumed at Nimroud by Mr. Layard—all of which are now in the British Museum. A wrought bar of Damascus steel was presented by King Porus to Alexander the Great, and the razor steel of China for many centuries has surpassed all European steel in temper and durability of edge. The Hindoos appear to have made wrought iron directly from the ore, without passing it through the furnace, from time immemorial, and elaborately wrought masses of iron are still found in India, which date from the early centuries of the Christian era.

How Sheffield Cutlery Is Made.

The Sheffield cutlery—one of the glories of England—is not made by machinery; it is chiefly made by hand. There are at Sheffield a few firms which manufacture cutlery right through from the making of steel to the finishing of tools, and employ wage-workers, and yet even these firms—I am told by my friend, E. Carpenter, who kindly gathered for me information about the Sheffield trade—let out some part of the work to "small masters." But by far the greatest number of cutlers work in their homes, with their relatives, or in small workshops supplied with wheel-power, which they rent for a few shillings a week. Immense yards are covered with buildings, which are subdivided into series of small workshops. Some of them cover only a few square yards, and there I saw smiths hammering, all the day long, blades of knives on a small anvil, close by the blaze of their fires. Occasionally the smith may have one help, or two. In the upper stories scores of small shops are supplied with wheel-power, and in each of them three, four or five workers and a "master" fabricate, with the occasional aid of a few plain machines, every description of tools—files, saws, blades of knives, razors, and so on. Grinding and glazing are done in other small workshops, and even steel is cast in a small foundry, the working staff of which consists only of five or six men. When walking through these workshops I easily imagined myself in a Russian cutlery village, like Pavlovo or Vorsma. The Sheffield cutlery has thus maintained its olden organization, and the fact is the more remarkable as the earnings of the cutlers are very low as a rule; but even when reduced to a few shillings a week, the cutler prefers to vegetate on his small earnings than to go as a waged laborer in a "house." The spirit of the old trade organizations, which were so much spoken of five-and-twenty years ago, is thus still alive.—*The Nineteenth Century.*

IS THE PLANER A NECESSITY?—AND IF SO, WHY?—The *American Engineer* asks: Why is not the planer a better machine than it is? Why has not this very essential tool been brought to that state of perfection that other great labor-saving machines have attained? Builders of them have not paid that attention to this hard-worked and tireless piece of machinery that they have to other wood-working tools. The demand for a smoother to do the very smoothest of surfacing is a want which has long been felt, and we notice that such a machine has been recently devised by the Egan Company of Cincinnati, Ohio, and exhibited at the late centennial exhibition in that city. This machine is said to work off the surface of any wood to a perfect polished surface as smooth to the touch as glass. The machine attracted much notice, and was awarded a special medal. Such a machine must prove of great service in all wood-working shops.

TUBE-MAKING AS A LOST ART.—It is wonderful how an art or system of manufacture may be lost sight of for centuries. Tube-making is now one of the most important branches of the iron and steel trades. Less than a century ago iron pipes did not practically exist in Great Britain, and yet it is undeniable that the use of pipes dates back to a very early period. In a description of the palace of Abdurrahman III, extant about A. D. 750, and situated at Zehra, in Spain, we find that metal pipes were used to convey both hot and cold water to the marble baths. A year after the battle of Waterloo iron flange pipes were cast in 2½-feet lengths, and packed at the joints with old hats. In 1811 and 1817 patents were taken out for welding barrels of firearms, and in 1824 Mr. Jas. Russell took out a patent for constructing iron tubing, but about a year after Mr. Whitehouse took out a patent for an improved system, which was the beginning of our great tube industry.

THREE HUNDRED MILES AN HOUR BY RAILROAD.—A railroad is being constructed in Baltimore, the speed upon which is expected to be 300 miles an hour. It is not for passenger travel, however, but for parcels. The cars will be driven by electricity through a tube two feet in diameter, and are expected to be perfectly under the control of the operator. If the experimental line now building should be a success, a line will be built, probably, between Baltimore and Washington.

TEN-INCH STEEL TARGET PENETRATED.—An important experiment was successfully made at the Naval Academy proving ground at Annapolis, on the 21st ult. A steel-pointed iron projectile weighing 250 pounds was fired from one of the new steel breech-loading rifled guns of the new cruiser Chicago, which penetrated a steel target ten inches thick and cut through a solid oak back. The experiment is considered as likely to have an important bearing on modern naval warfare.

SCIENTIFIC PROGRESS.

Oil on the Waters as a Preventive of Fogs.

Brand's Dictionary of Science, Literature, and Art, under the head of "Fog," says:

"Fogs in general are the consequence of the nocturnal cooling of the atmosphere. The air, by its rapid cooling, becomes surcharged with moisture, a part of which, being precipitated in the form of a cloud, gives rise to the ordinary fog. During the day the heat of the sun generally disperses the fog, because the quantity of moisture which the air is capable of holding becomes more considerable in proportion as its temperature is increased. In calm weather the surfaces of rivers, lakes, etc., are frequently in the morning covered with fog. The reason is this: During the night the air is cooler than the water; the strata of air in contact with the water are constantly heated, and become saturated with moisture. The mixture of the vapor with the air, together with its elevation of temperature, renders the air specifically lighter. It rises in consequence, and, mixing with the cold air in the superior strata, is cooled, and precipitates its moisture," etc.

In commenting upon the above, a correspondent of the *Scientific American* says:

It is obvious that the above explanation applies equally to the giving off of visible vapor —the "smoking," as it is commonly called, of hot water when standing in any uncovered open vessel.

Now, in this case, as I have found by experiment, though no doubt any practical scientist could have assured me of the result in advance, it needs but a small quantity of oil poured upon the "smoking" water to arrest at once the process of its visible vaporization.

Reasoning from this fact, I should suppose that there might be other uses for pouring oil upon the water than the quieting of the waves. I take it for granted that the fogs most dangerous to navigation are precisely those still fogs due to sudden though slight changes in the relative temperatures of the water and air, which are illustrated upon a small scale in the "smoking" of hot water in an open basin, and which can be prevented or stopped by the use of oil.

Again, if oil is effectual to prevent the vaporization of water, why may it not have a possible most valuable use in river or seaport settlements, to arrest the spread of malarial diseases, and even of yellow fever?

THE MYSTERIES OF VISION.—Emil Sorel, in *La Nature*, says: "There are days on which, in certain weather, and despite the curvature of the earth, the distance of visibility is doubled, or more than doubled. This phenomenon is explained to us by a well-known law of physics. If we throw a coin into an empty vessel, it will be hidden by the edge of the latter, at a certain distance; but if we fill the vessel with water, the coin will become visible. We have here a case of refraction, such as is explained in elementary works on physics. Every one also knows the theory of the mirage put forth by the celebrated Monge, who explains the phenomenon as due to a diminution of the air's density in contact with the superheated earth. A contrary theory will explain the mirage at sea. While the sun is making the atmosphere intensely hot, the sea and the strata of air in contact therewith remain relatively cold, and these strata become superposed in the order of their density. A luminous ray emanating from the sea will pass from one stratum into another of less density, there will be a refraction, and an object beneath the horizon will be seen above it. This theory supposes two conditions, to wit, a heating of the atmosphere, while the sea and the earth remain relatively cold, and a calmness of it to permit its strata to become superposed in the order of their density. It is precisely when these two conditions are fulfilled that the phenomenon of the mirage occurs. On such days ships rise instead of descending in measure as they recede. As the horizon is perceived by direct visibility, a ship is finally seen above the horizon as if it were suspended in the air. It is the famous 'phantom ship,' familiar to sailors—a visible ship in its natural upright position. If atmospheric conditions were favorable, a second ship would be seen above the first, etc. Certain mariners worthy of credence have assured me that they have seen as many as seven superposed ships.'

A NEW PROCESS for the rapid generation of hydrogen is described in a recent impression of the French journal *La Nature*, which appears to be well worth the attention of those interested in the subject. From the account of the process referred to, the purpose of the invention is presumably to generate the gas for the inflation of balloons for military uses. It is as follows: We are informed that Messrs. Majert and Richter have devised, had constructed, and successfully experimented with, at Berlin, an apparatus that does away with the inconveniences of former processes. The hydrogen is obtained by heating a mixture of slaked lime and powdered zinc, the carriage of which on a campaign is rendered easy by inclosing it in tin cartridges. The water of the slaked lime is decomposed by the zinc, and, as a result, there is obtained a pure gas, free from arseniated hydrogen, which is so dangerous to man, and from sulphuric acid, which is so injurious to the balloon. The apparatus for producing the gas is heated by any combustible whatever. It is in the form of a small locomotive, and is easily drawn by four horses. In front, there is a seat for two men, which can be removed in a minute and be replaced by a chimney. The fire is started, and in six minutes the cartridges are red-hot. As soon as this temperature is reached, the cartridges are introduced into the retort, and five minutes afterward the production of hydrogen goes on normally. With 120 cartridges, about 390′ per hour are obtained. A military balloon of ordinary dimensions can, therefore, be inflated in three hours.

TERRIBLE VOLCANIC DISTURBANCE.—Scientists are not done with the study of the great volcanic disturbance at Krakatoa in 1883. The long-looked-for report of the scientific commission which investigated the great volcanic eruption of Krakatoa in 1883 has at last made its appearance, and it seems strongly to confirm the theory that the famous "red sunsets" of that time were caused by the canopy of dust and steam thrown up by the tremendous convulsion of nature. So great was the explosion of the burning mountain that the noise was heard over one-thirteenth of the total surface of the earth. At Bavaria, 30 miles away, buildings were wrecked by the concussion. In Ceylon, 2000 miles away, a sound as of heavy guns was heard. At Rodriguez, nearly 3000 miles away, it was distinctly heard, like the roar of distant artillery. The sea wave caused by the upheaval was perceived as far away as the English Channel, while a great atmospheric wave swept three times from Krakatoa to the antipodes and back again. Fully 1⅛ cubic miles of rock were hurled into the air, some fragments reaching a hight of 17 to 23 miles. It is not difficult to believe that enough of this dust and vapor were wafted to this side of the world to produce the beautiful phenomena that were the wonder and delight of every observer of the sunsets. And yet it is but reasonable to suppose that this was but a mild phase of volcanic energy when compared with that which so often must have shaken the earth and sea during the great volcanic period which occurred about the time that man first made his appearance on the earth.

THE DURATION OF LIGHTNING FLASHES.—It is well known that the lightning flash, or the spark between the terminals of an influence machine, exists for so short an interval of time as to be beyond measurement by any ordinary means. But notwithstanding the acceptance of this knowledge the peculiarities of some of the flashes photographed have been supposed to be due to the camera, or the sensitive plate, being at the time in a state of vibration. To test this line of thought, Mr. James Wimshurst, according to *Engineering*, has made a dark slide for his camera, in which is fitted a train of clockwork carrying a disk, upon which is an arrangement for holding the sensitive plate. When all is complete for photographing a flash the clockwork is wound up, the sensitive plate then rapidly acquires great velocity, which at the maximum reaches 2500 revolutions per minute, and with the plate rotating at this speed the spark is photographed. A photograph taken under these circumstances in no way indicates movement in a sensitive plate, for the photograph throughout its length is as sharp and as clear as though the plate had been at rest. The experiment is interesting, for it not only shows the infinitely short existence of the spark, but it also shows that chemical change in the sensitive film takes place in an equally minute interval of time.

WHEN ARE PETROLEUM VAPORS EXPLOSIVE?—Since the recent explosion of a petroleum vessel in Calais harbor, experiments have been made to determine what proportion of petroleum vapors mixed with a given amount of air will form explosive compounds. In mixing ordinary illuminating gas with air it is found that one part of gas to eight of air gives the most violent explosion, and with the vapor of the volatile portion of petroleum nearly the same observation is made. With one part petroleum vapor to five of air no explosion takes place. With six parts of air there is a feeble explosion, and with from seven to nine parts a very violent one. With 12 parts of air the detonation is still violent, but with 16 parts it becomes feeble, and with one part vapor to 20 of air there is ordinarily no explosion.

POTELINE.—This is the name of a mixture of gelatine, glycerine and tannin, to which sulphate of barium, or of zinc, may be added, and which may be colored by vegetable colors. It may be kneaded while warm. When cold it may be used for numerous purposes. It can be turned, filed, bored, polished, and can be used for hermetically sealing bottles, etc. The proportion of ingredients varies according to the uses. For sealing bottles, of course, it must be used liquid. Potel, the inventor, uses it with success for preserving meat, by applying it liquid, at a temperature of 50° to 60° C.—*Jour. de Ph. d'Als.-Lorr.*

THE RESISTANCE OF SNOW TO PROJECTILES.—In Norway it has been discovered that snow offers a considerable resistance to projectiles. A colonel had a snow-trench 2 meters 50 centimeters thick built, and three shots were fired at it from a distance of 33 meters. The balls only penetrated to the distance of 1 meter 20 centimeters, and were found entirely shapeless.

USEFUL INFORMATION.

FEATHER-BONE.—Among the various substitutes for whalebone that have been introduced, the latest is what is termed feather-bone, made from the common feather or quill of the chicken, goose, turkey, etc., the larger ones only being used, especially such as are thrown aside by the feather-duster makers. In this process, the quill is first stripped of its plumage, which latter is saved and used for making mattresses, and then run through a small machine, consisting of two rollers, a knife splitting it in the center, the pith being next removed by a small rasp-like wheel. The quill now passes to a machine comprising two sets of fine circular knives running together, by which it is slit into small sheets, the length of the quill; these are taken to the winder, a small funnel-shaped machine with winder attached—a sort of thread spool at the mouth of the funnel—on which the quill shreds are wound together in a compact roll of one-sixteenth to one-eighth of an inch in diameter In this condition it is used to produce the bone, three or more being wound together by a similar machine, except that, instead of being singly wound, the winding is doubled by having two winders running in opposite directions. These are then stitched together lengthwise between the cords, by means of a common sewing machine, making it very compact and fine.

A PECULIAR INDUSTRY.—Under the above head a current paragraph gives the following particulars of the product of the castor bean: The oil is especially adapted for lubricating all sorts of machinery, clocks, watches, etc ; and it is an excellent lamp oil, giving a white light far superior to that of mineral oil, petroleum, rapeseed, linseed, and all other oils, whether vegetable, animal, or mineral; it also gives very little soot, and, all things considered, has been pronounced the cheapest oil known. All the great perfumers of London and Paris use castor oil for the manufacture of golden oil, so well known for its property of keeping the head cool, and the skin and its pores, as well as the roots of the hair, soft and open. The oil is used for textile fabrics to fit them for dyeing or printing, for which purpose the Indian dyers and printers invariably employ it; and it is one of the best oils for dressing tanned hides and skins of all kinds, on account of its imparting to them such a degree of strength, durability, tenacity, and beauty. From the oilcake, in addition to its other uses, a gas is obtained which gives a superior light, some of the stations on the East India railway being illuminated in this way. The oil dissolves completely in alcohol, and this, incorporated with a solution of copal, makes a varnish which, it is said, is very useful in polishing all kinds of first-class furniture, carriages, picture frames, cloths, canvas, etc.

A PLUMBER'S NEW TRICK.—The *Sanitary News* describes a plumber's new trick, which has been first discovered in Milwaukee, but may be known elsewhere, so that architects and inspectors will do well to be on their guard against it. In Milwaukee, as in many other towns, all soil pipes put up in dwelling-houses must be tested by filling them with water. A certain firm, knowing that a defective pipe had been used, contrived to plug it with clay, so that the water applied for testing it did not enter the pipe at all. It is not stated how the inspector happened to find out this ingenious deception, but plumbing inspectors become wonderfully expert in observing suspicious indications, and the offending firm was reported and punished by having its license revoked until the defective pipe should be replaced by a new one. Most persons will say that the revocation of the license ought to have been made permanent.

THE FLOW OF LIQUID THROUGH PIPES.—A cylindrical pipe flowing full, discharges less than the same pipe when only filled through a segment whose arc is 281° 30 minutes by 2.5 per cent, while the velocity is less by 9 5 per cent, the hydraulic inclination being the same. The full section discharges less, and also with less velocity, in other forms of pipes as well as in cylindrical. The scouring power of circular pipes flowing full is therefore less by nearly 10 per cent than that of the same pipes filled through an arc of 281° 30 minutes, a new element to be considered in the arguments for and against circular pipe sewers.

VARNISH FROM SUGAR.—The *Scientific American* advises the use of a varnish of sugar. This is made as follows: Dissolve equal parts of white and brown sugar in water to a thin syrup, add alcohol, and apply to hot glass plates. The film dries very readily, and furnishes a surface on which it is perfectly easy to write with pen or pencil. The best ink to use is India ink, with sugar added. The drawing can be made permanent by varnishing with a lac or mastic varnish.

A LONG PIPE LINE.—The completion of a pipe line from the Lima oil-fields to Chicago and the successful transportation of oil through a line 200 miles long with the propulsion of one mammoth pump, is regarded as a triumph of engineering skill and enterprise.

DRAFT OVER DIFFERENT PAVEMENTS.—Mr. Rudolph Hering, C. E., is authority for the statement that the load which one horse can draw on an asphalt pavement will require two horses on the best Belgian block, three horses on ordinary Belgian block, five and one-fifth horses on good cobble-stone and seven and four-fifths horses on bad cobble-stone.

USE FOR OILY ROPES.—The old oily ropes gathered up around oilmills, etc., are now utilized in the manufacture of heavy manilla paper, such as is made into bags for grocery-stores. Cables that have been used in boring an oil well are considered especially valuable. The collection of these worn-out ropes throughout the oil regions of Pennsylvania and Ohio has become quite an industry among the representatives of paper manufacturers.

HANDLE KEROSENE, benzine and gasoline by daylight only. Where gasoline is stored, see to it that there is ventilation from beneath, as the vapor from it, which is heavily explosive, is heavier than air, and will not ascend, but must be allowed vent below. If these precautions are observed closely, the danger of fires from these inflammable fluids will be reduced to a minimum.

STEEL WIRE MATS, a new article in metallurgical industry, are fast coming into use. They are made from steel wire, with steel frame and steel braces, all perfectly galvanized, and are wear and weather proof, are self-cleaning, require no shaking, and by the slightest scrape, snow, ice, mud, clay and water are wiped out of sight.

METALLIC PENS NOT OF MODERN INVENTION. At Acosta a Roman metal pen has been found. It is a bronze pen slit in exactly the same fashion as the present steel pen. The Dutch invented a metal pen in 1717, but it was not until many years later that the hand-screw press, which made the first cheap steel pen, came into use.

FOR REMOVING OLD VARNISH.—A mixture for the removal of old varnish has been patented in Germany by a Mr. Meyer. It is obtained by mixing 5 parts of 36 per cent silicate of potash, 1 of 40 per cent soda lye, and 1 of salammoniac (hydrochlorate of ammonia).

CASTOR-OIL LEAVES, fresh from the plant, bruised or rubbed in the hands, and then stuffed tightly into a stiff boot or shoe and left to remain for 12 or 24 hours, according to the character of the leather, will render the same quite supple—so it is said.

A GERMAN is reported to have invented a paper that resists the action of both fire and water. Asbestos, aluminum, sulphate, chloride of zinc and resin soap are the ingredients.

THE largest carpet in the world has been on exhibition at the Cincinnati exposition. It contains 2700 square yards.

GOOD HEALTH.

Points About Pneumonia.

According to a medical contemporary, Dr. Gouverneur L. Smith of New York has just given some interesting and startling facts in regard to pneumonia. Dr. Smith points out that the disease is becoming worse every year, increasing rather than decreasing, both in the number of cases and the percentage of mortality. The statistics of the Pennsylvania hospital show that the mortality from pneumonia there advanced from 15¼ per cent in 1847 to 31 per cent in 1886. Similarly, in the New York hospital the ratio of mortality from this disease is more than double what it was in 1878. Thirty or forty years ago it was regarded as serious, but it did not excite anything like the alarm it does to-day. Dr. Smith is rather inclined to believe that the medical art, instead of progressing in its treatment of pneumonia, has actually gone back, and holds that the old methods of treating the disease at the time it was less deadly have been abandoned for methods more finical, but less efficacious.

Symptoms of Approaching Pneumonia.

Dr. J. B. Johnson writes in the *Medical Summary* as follows:

The approach of pneumonia is not always without warning. There are usually certain feelings or sensations of the body which tell, with greater or less certainty, that an attack is beginning. An individual, for a day or two prior to the actual invasion of the disease, feels badly in a general way. These bad feelings consist of a chilliness of the whole body, and if his clothes be at all damp with perspiration he feels cold and uncomfortable. He is feverish, and yet it seems impossible for him to get warm. This feverishness is attended with great chilliness, which increases when he is exposed to a draft of cold air.

As evening approaches all these bad feelings are increased, and when night comes on he has pains in his back and limbs, accompanied by a slight cough and unnatural frequency of breathing, with unusual quickness of the pulse and a feeling of uneasiness or oppression about the chest. His sleep is disturbed by chilliness, restlessness and unpleasant dreams. The warmth of his bed and bed-chamber may cause a slight cessation of his bad feelings, and in the morning, feeling better, he goes out attending to his business, only to have all his bad feelings return with increased force at the approach of the coming night.

Should he heed the warning implied by the return of his bad feelings and confine himself to an equal temperature of about 65 degrees, and partake of copious drinks of hot tea, coffee or milk, he may possibly avert an attack of the disease. But, unfortunately, he is apt to neglect to do this, and his going about is only arrested by an actual invasion of pneumonia, which usually comes on in from one to three days.

HOW TO BREATHE WHEN READING.—M. Legouve tells the anecdote of Talma watching the actor Dorival from the prompter's box until he had discovered his secret, which consisted in always taking a fresh breath before the last one was quite exhausted, and in doing his best to conceal the beginning of each phrase by starting whenever he could on an a, e or an o—"that is to say, at the point where the fact of the mouth being already open makes it possible to take breath lightly without the action being perceived." Again, Delle Sedie, the celebrated singer, could run up and down the scale in front of a lighted candle without the flame wavering. "How is this done?" It is because he employs exactly the quantity of breath needed to carry the sound of the notes. If you or I were to try it we should simply waste our breath. In the chapter on "Pronunciation" M. Legouve insists, and the point can scarcely be too much pressed, on the value, the absolute need, in fact, of clear articulation as opposed to mere exertion of voice. This he illustrates by a story of Bouffe when he was playing Pere Grandet in the "Fille de l'Avre." When he came to the most touching scene of the piece, when the old miser finds that he is robbed, the actor began to scream out the words as he was accustomed to. At the end of a few minutes the sound died away on his lips, and he was compelled to continue in a murmur. What happened? That he was a thousand times more true and more touching than before, because he was obliged to make up for weakness of voice by force of articulation. It is true that one cannot speak without a voice, but voice alone has so little to do with diction that there are readers, orators and actors to whom the very extent of their voice is a drawback. Unless they are skilled in articulation the volume of sound devours the sense.

DIFFERENT PHASES OF "MIND CURE."—Now that all forms of mental healing are much talked of and largely adopted, it might be well for the public to know that the disciples of the different schools resent the common practice of outsiders bulking them all under the head of "mind cure." Mind enters into each one, to be sure, but in different forms and through different doors. They who practice "Christian science" draw healing force from the Infinite Mind, and consider their own minds as at most a mere telegraph line through which the vivifying power reaches the patient's mind. Plain "mind cure" works by the operation of the healer's individual mind on the subject, and partakes of what is known as mesmerism or hypnotism. "Faith cure" and "prayer cure" are one and the same, both relying upon faith to override disease. If any one doubts that the healing of disease by mental methods is going on briskly in this city, let him drop into the offices of some of the best-known practitioners and see the collection of patients waiting hour after hour in order that each may get a treatment. Nine o'clock is the hour for beginning the business of healing. An hour before that, six and eight patients are in readiness to get their slice of life and health as drawn from the infinite source of all life and wholeness. From that time on until the office closes at night it is never empty, and most of these reach a point when they declare themselves healed.—*New York Press.*

EFFECT OF PETROLEUM ON THE HUMAN BODY.—A German physician has recently issued a report of his observations on the effects of petroleum on the human body. The facts on which his conclusions are based have been gathered during extensive travels in the American petroleum districts. He found that a skin disease was very prevalent among the workmen who were employed at the wells, and on closer examination he concluded that the disease especially attacked those who were engaged with the heavier and more inflammable oil. Numerous cases were discovered of large quantities of petroleum having been swallowed, with the result of violent affections of the stomach, kidneys, and nervous system. In one case where a glassful of petroleum had been drunk, the greatest difficulty was experienced in preventing the patient from falling asleep, an eventuality which is especially fatal in such instances. Symptoms of poisoning could also be traced after a lengthened period of inhalation of the vapor, but the symptoms were only noticeable when the subject was in a bad state of health.

AN ILL TURN.—The people at large are too ignorant, too much afraid of pain, too unwilling to deny transient enjoyments or to be governed by hygiene, to pay physicians for wisdom if they tell them they need nothing but cleanliness, exercise, and moderation. They turn to the quack, the patent-medicine bottle, the paregoric, Jamaica ginger (another name for spiced rum), patent gas, or any one of the thousand ways of trying to escape the penalty of continuing to act as though nature's laws were a fraud. —*Christian Advocate.*

Electricity and Plant-Life.

From time to time, of late years, says the *Scientific American*, experiments have been made of the effect of the electrical light on flowers and plants, with results seemingly the same, to wit, feeble efforts of some plant to prolong their periods of bloom into the night and then premature decay. One has only to study their actions, as observed, to conclude that even plants need rest, or to be more precise, they seem to thrive best under the conditions which Nature has imposed—the period of darkness and the period of the light which is heat as well, or else that the family of plants, as they now are, sprung from these exact conditions, and will not thrive without them. It is the nature of some flowers, as every one knows, to open at one period of light and close at another; of others to open only at night and close before or at the moment when the orb of day tops the horizon. So strictly do some of these follow their unwritten laws, that floral clocks have been constructed, so that one may step out into his garden, of a bright day or clear night, and learn the time by the condition of bloom on the floral dial.

Prof. Wollney of Munich, satisfied by experiment that electrical light will not advance or improve plant growth, recently tried the effect upon them of the current itself. We quote the following, being the means employed and its result:

He "took patches of ground 12 feet square, separated by boards penetrating the earth to the depth of a foot. In one case he applied two earth plates and interposed five earth cells; in another he inserted an induction apparatus; and in a third, a plate of copper at one side and a plate of zinc at the other side to form a natural battery. Peas, potatoes, carrots, etc., were planted on these and other patches; but the electricity, whether of high or low potential, seemed to have either no influence or a bad one upon their growth."

Plants being full of sap, and sap a fairly good conductor, every fiber must have been reached, and, so far as the professor was enabled to perceive, the only effect of the current was to provoke a perturbation on the protoplasm.

Waste in Power.

With high-speed machinery and shafting driven at 300 turns per minute, it takes but a small resistance to waste a large amount of power. A load of only ten pounds on a three-foot wheel will call for one-horse power from the coal pile, and a light belt left dragging on the pulley will offer more than ten pounds resistance. The Emerson power scales were recently applied to a pulley where the belt when thrown off and hung up out of the way would rest on a short arc on the driving-wheel, and it was found that this pulley required more power than was used on the machine it drove when the belt was in motion. Leather has a wonderful clinging tenacity, and wherever it is allowed to drag on the framework or guide-bars, or in some of the belt-holes when the bolt gets slack, more or less power will be absorbed, though the wear of the belt may not be noticeable. We have seen the set-screw of a pulley slip and draw the shaft along in the bearing till one of the larger wheels rested against a floor beam, the rim cutting into the wood and the beam, making use of the friction brake in absorbing power till the line of shafting was brought into place. Belts that have been overstretched by having more to do than they are able to manage are not apt to run true on the pulley, and where the faces of the wheels are no wider than the belt they must not run very close to the framework, as the projecting edges of the belt may strike and offer a large amount of resistance. When there are indications of frictional resistance by the room becoming filled with the fumes of belt grease, there is a chance for some one besides the fireman to make a saving in coal, if it is nothing more than to remove the oiler's ladder that is grinding its way into the space between the fly-wheel and brickwork.—*Exchange.*

The *Safety Valve*, in commenting upon the above subject says: "If a belt be thrown over a stationary pulley and one end loaded with 100 pounds, it will be found that on an average it will take 400 pounds on the other end to make the belt slip. There is no certainty about quantity, however. Under exceptionally favorable circumstances of belt and pulley, it may take 1000, and under very unfavorable conditions it may slip with only 200 pounds.'

BLAST FURNACES THERE AND HERE.—Of the 877 blast furnaces in Great Britain, 425 were in blast two months since, and 452 were out. On the same date 298 furnaces, with a capacity of 126,082 tons per week, were in blast in the United States, and 296 were out, with a weekly capacity of 82,147 tons per week.

THE ELECTRICITY in a flash of lightning would seem from a careful scientific observation to be much less than is generally supposed. Prof. Kohlrausch has recently estimated that quantity. He finds that from 7 to 35 flashes would be required to keep an ordinary incandescent lamp alight for an hour.

A TALKING NEWSPAPER, or a daily composed of phonographic records, is the latest idea with which the New York *World* credits Mr. Edison.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VALPARAISO.—*Dispatch*, Jan. 5: The Huntington roller-mill at this mine is giving good work. In two weeks 104 tons of rock were crushed. The last cleanup netted over $1500.

DRYTOWN CON.—The work on this property is moving along steadily. They will haul their pipe next week and put it in place at once. The directors will meet in a few days and give the contract for the water-hoist. They will push work to all possible speed and expect to see the bottom of the 300-foot shaft in about three months, where there is a 5½-foot ledge of ore that did pay $1.70 per ton in free gold and 1½ per cent sulphurets that are worth $90 per ton, at the last working 12 years ago. From the surface down to the 250-foot level the ore averaged $10 per ton and the sulphurets worked over $100.

NEW YORK MINE.—This mine, which is southwest of Jackson about three miles, is looking well. The superintendent, Mr. Anderson, showed us some rock this week which looks good. This mine is worked by a tunnel which is in 426 feet, with a depth of 200 feet from the surface. The ledge is 20 feet wide and all of the rock is good milling ore. Four men are kept constantly at work. As soon as the wet season is over a large mill will be built on this property.

READ & ASKEY.—The new 10-stamp mill at the Read & Askey mine was started last Monday morning, on good ore from north tunnel. The tunnel is now in 300 feet and shows a ledge from four to five feet wide. The rock will average about $15 per ton. The McKenzie mill is idle and will so remain for about two months. Lack of water is the cause of the standstill.

GOVER.—They turned the water into their new pipe Saturday, which leaks like a sieve. It will take some days to get the joints sufficiently tight to carry enough water to run with. The mill has closed down to make the connection, and will start up Sunday. They will turn water on the hoist in about two weeks.

OVERPLUS.—This mine is idle for a few days, as Mr. Goodman is in San Francisco. The ore is very hard, and the mill was closed down one-third of the time for repairs. The last 10 days' run turned out $1000 in free gold and sulphurets.

COSMOPOLITAN.—They are still pushing the east crosscut ahead; face of drift is hard slate; the ore body cut is 35 feet wide. The south drift is in 45 feet, the face is soft slate.

NORTH STAR. — It is reported that they have stopped sinking the winze on this property, and are driving the tunnel south as before with good indications.

COSMOPOLITAN MINE.—The shaft is down 500 feet, and a crosscut 38 feet and is not through to the hanging-wall. There is a good outlook for a mine.

NORTH CAROLINA.—They are still taking out ore and filling up the mill. They wish to get 250 or 300 tons ahead of the mill before starting.

ALPI MINE.—The company organized to work this mine has been incorporated.

Calaveras.

INDIAN CREEK.—Calaveras *Prospect*, Jan. 4: From Indian Creek we learn that a large spring of water was struck in the lower level of the Esmeralda mine, causing the temporary suspension of work in that level and filling the shaft for more than 100 feet. The spring has now greatly decreased and, once the accumulated water has been hoisted out, will be easily taken care of. A number of promising prospects are being found in this locality, notably two locations by George Hengen and one made by Maroc, the Australian. Some of the rock from one of Hengen's claims is remarkably rich in free gold for rock that is not pocket.

MURPHYS.—Cor. Angels *Record*, Jan. 1: There is little mining news at present. The usual amount of prospecting is being done, but no new developments are recorded. The Norfolk company continues to prosecute its work with vigor, adding a few men from time to time as they have room for them.

Fresno.

BITUMINOUS COAL.—Fresno *Expositor*, Jan. 2: "Yes," said Thomas E. Hughes this morning, "we feel very much encouraged over our coal developments in the Coast Range. We have had five men prospecting for coal for several months and we have succeeded in locating three well-defined veins which promise an abundance of fuel. The largest vein is five feet thick, the next three feet, and the smallest 16 inches. It is bituminous in its nature and strongly resembles the Seattle coal, only I think it is a better heat-producer. That has not yet been determined. We are prospecting now to see what is in the range. Our company stands ready to assist in building a railroad across the country to the coast. We are ready at any time to give $30,000 toward the construction of such a road." Mr. Hughes showed a specimen of the coal. It was hard, of very bright color, and no amount of hand friction would soil the fingers. An unlimited five-foot vein of bituminous coal in the Coast Range opposite Fresno means everything for the people of this fertile section. In conversation with another member of the company he stated that the vein was well defined and promised handsome yields. As soon as the weather settled so they could get into the mountains, it was probable a large force would be put to work getting out the fuel.

Inyo.

GOLD ORE.—Inyo *Independent*, Jan. 5: For some time past Isaac Hitchcock and his brother-in-law have been at work opening up a mine in the Alabama hills near Lone Pine. They now have a quartz ledge opened about 200 feet. The ore carries gold and copper. Worked in an arastra the ore is said to yield $60 per ton in gold. It carries a high percentage of copper. Some parties at Independence are interested in the mine. It is intended to ship a carload of ore to Dayton to be worked for the copper and see if it will pay to continue the shipment.

BORAX.—Trudo, McAfee and Carson have Indians at work making a road from Saline valley up to Cerro Gordo. The object in making the road is to reach a borax deposit in Saline valley and bring the borax to Keeler. The length of the road from the borax swamp to Cerro Gordo is about 18 miles; from Cerro Gordo to Keeler the distance is nine miles. The road crosses the Inyo range of mountains. The borax is described as being very extensive.

BEVERIDGE.—Tom McDonough heard a few days ago that parties were taking rich ore out of his mines over in Beveridge. He has gone over the Inyo mountains to see what was going on. Mr. McDonough usually comes in from his mine in the winter and stays in the valley until spring, not leaving any one at the mine.

Los Angeles.

A FAILURE.—Newhall *Times*, Jan. 5: It now seems as if the Cora Belle Mining Co. is defunct. Several attachments have been levied on the machinery at the mine, and the land will be levied on next week. We will not attempt to give the reasons for its failure, for if the reports we received from the mine were correct, it must have been bad management that caused it.

Mono.

A NEW OUTLET NEEDED.—Homer *Mining Index*, Jan 7: A connection should be made between the May Lundy and Great Sierra wagon-roads. This will give Mono county another outlet, a short cut through Lundy and Tioga to railroad, cheaper fares and freights, and at once open up one of the richest and most extensive mineral belts in the State, the grandest scenery of the Sierra, and by far the largest forest of sugar-pine timber on this coast.

LOCATIONS.—Comparatively few locations were made in Homer district last Tuesday. Time was when they would have been numbered by the score.

OLD DIGGINGS.—But one claim was located in Old Mono Diggings on New Year—the Northern Light, formerly known as the Bulwer. It is situated immediately north of the Rattlesnake mine, on the same lode. Paul Wallenberg was the locator.

GREAT SIERRA.—Wm. P. Onkst, superintendent of the Great Sierra, has left at this office samples of ore from the Golden Crown mine, Mount Gibbs, averaging $480 per ton, silver. Some portions of this ore assay more than $1000 per ton. The vein from which this was taken is eight feet wide, with ten inches of rich ore in the center.

San Bernardino.

ORO GRANDE.—San Bernardino *Index*, Jan. 2: A gentleman who arrived from Oro Grande yesterday, says the camp is quite lively. There are about 200 men at work at the limekilns, in the quarries and in the mines. The four limekilns are kept running to their full capacity night and day and for the 24 hours turn out about 275 barrels. The mines are working a large number of men and some good ore is being taken out. The ten-stamp mill is at work night and day on ore from the mine of Horace Adams, which is located about six miles east of Oro Grande. The ore is of high grade, and is paying well.

Shasta.

LOWER SPRINGS.—Cor. Shasta *Democrat*, Jan. 2: J. Penrose and John Walton are working on the old Walton & Vickers mine. They are getting $6 a foot for sinking a shaft. This mine is located about 200 yards from the old Shasta road, on the right-hand side coming up. The Wiser boys have not sold out yet, but still continue to keep going. They have a nice ranch which is well worth the price they ask for it. Their place has many good ledges on it which go with the farm. They have a mine called the Spanish Ledge, which shows up splendidly in free gold. Mr. Holly is the possessor of another lump of gold, which weighs $52.31. Mr. White is still progressing on his mine. He is very confident that he will "strike it rich" and we believe he will. Mr. Frick is taking out good rock west of Miller's on the Ida May mine.

Sierra.

FOREST CITY.—*Mountain Messenger*, Jan. 5: Mott and Cadman have been taking out some rich dirt lately, up on Kanaka creek. Their last cleanup netted $100 per man for the week's work. They have four men employed. J. Pearson has struck good pay down Kanaka creek not far from the Red ledge.

BUFFALO.—The owners of the Buffalo quartz mine, Hog Canyon, are pushing things with a rush and have just completed their ten-stamp mill. All buildings and track are finished, and two gangs of miners are taking out quartz on the north and south sides of the creek. The Buffalo company are anxiously waiting for water to crush rock, when, shortly, we may expect returns that will gladden the hearts of the shareholders.

Siskiyou.

SCOTT BAR PLACERS.—Yreka *Journal*, Jan. 2: The placer claims in this vicinity, with the exception of that of Martin Andrews on the Klamath, have generally been paying well this fall and winter.

Tuolumne.

BUCHANAN.—Tuolumne *Independent*, Jan. 5: The Buchanan mine commences the new year under most favorable auspices. The chlorination furnace is working night and day, to the satisfaction of the company, under the direction of Mr. A. Maltman. The mill is running to its full capacity. Sinking has been resumed from the 700-foot level. A new ore chute has been discovered, which promises to be richer and larger than the present one. Mr. Stephen Moore, one of the most experienced and best known mining men on the coast, has been appointed sup't. J. T. Murnan resumes his former position in charge of the office, and Thomas McGovern looks after the store. In a few months the Co. will have more men on the pay-roll than at any previous time. Everything moves like clock-work, and improvements of value, which reduce the cost of working—a progressive economy—are being continually adopted as mining science stamps upon them the seal of success.

NEVADA.

Washoe District.

CROWN POINT. — Virginia *Enterprise*, Jan. 3: Have stopped the 700 No. 3 west crosscut and resumed work in the south drift, which was advanced 29 feet. The face is a mixture of quartz and porphyry.

HALE & NORCROSS.—On the 500 level the north drift is now extended 100 feet and continues in good ore. Are advancing stopes in this body in ore of good quality. On the 600 level the west drift has passed through two feet of rich ore. Its face is now in low-grade ore, quartz and porphyry. On the 1300 level have started an upraise 100 feet south of the shaft. This upraise is in fair-grade ore. From the station on this level have started a drift north, which is advanced 10 feet. During the week have hoisted 1053 tons of ore, and have shipped to the Mexican mill 1062 tons, and have milled 1135 tons. Average battery assays were $24 per ton. Have bullion on hand and previously shipped this month amounting to $87,488.53.

SAVAGE.—On the 400 level the main west drift has been advanced 16 feet, making its total distance from the shaft 315 feet. Are extracting ore from the stopes in the north and south drifts on this level. On the 500 level the main west drift has been extended 23 feet, making its total distance from the shaft 235 feet. The last 10 feet of this shows some stringers of good ore. Are extracting ore from the east crosscut; also from the old stopes and the south drift on this level, and from Nos. 2 and 3 crosscuts on the 600 level. During the week have hoisted 488 tons of ore, and have shipped to the Rock Point mill 333 tons and have milled 355 tons. The battery assays average $17.04 per ton.

SEG. BELCHER.—The south joint, 1100 drift, is out 291 feet, having advanced 48 feet during the week. Monday a clay wall was struck, and through it has been found a body of quartz which penetrated four feet. It is running southeast and northwest, and dipping about 60 degrees to the east. The quartz yields some fair assays, but is low in grade on the average. It is hardly possible that this is the same quartz which was prospected in the 1300 raises.

BEST AND BELCHER.—On the 300 level the north drift started 25 feet west of the winze has been advanced 14 feet; total length, 104 feet. Formation porphyry, with streaks of quartz. In the incline winze at a point 50 feet below the 300 level, east crosscut No. 2, started 25 feet north of east crosscut No. 1, has been advanced 16 feet. Formation, porphyry and quartz showing some value.

CONFIDENCE.—The raise from the 1200 to connect with the 1100 level is up 125 feet, 20 feet having been added during the week. The top of the raise shows ore of fair quality. The south drift on the 1300 level is in 34 feet, 17 feet having been added during the week. The vein shows quartz giving low assays. Shipped 100 tons of ore daily; average battery samples, $28.46.

BELCHER.—The 200 north drift advanced 22 feet since last report, and is now out 310 feet from the shaft. The face is in porphyry mixed with low-grade quartz. The 150 drift to meet it advanced 30 feet and struck an old drift in a fair condition, leading into the Crown Point and Belcher line.

JUSTICE.—The raise above the 490 level is up 57 feet, having advanced 13 feet since last report. The top of the raise shows two feet of milling ore. The west drift on this level is out 246 feet. The 370 level station is completed, and a north drift has been started from it.

IMPERIAL.—No. 1 crosscut on the 1100 level is out 88 feet, 7 feet having been added during the week. Stopped work on this crosscut and started No. 2 crosscut 100 feet north of No. 1, and advanced it four feet, the face showing vein material.

ALTA. — Have received over $25,000 from the running of concentrates at the Reno Reduction Works in December. The new plan of amalgamation and concentration is very satisfactory. The mine looks well.

GOULD AND CURRY.—On the 200 level the north drift 100 feet from the top of the upraise from the 300 level has been extended 33 feet; total length, 153 feet. Formation, hard porphyry.

YELLOW JACKET. — Shipping daily 100 tons of gold-bearing rock to the Santiago mill, and prospecting in upper levels.

CHALLENGE.—Shipped during the week 130 tons of ore daily to the Brunswick mill; battery samples, $28.46 per ton.

BALTIMORE.—Still drifting on the 350 level, and saving ore taken out for reduction.

CHOLLAR AND POTOSI.—There is merely progress to report in the work of exploration.

ALPHA.—Drifting north and south on the 500 level.

BULLION.—Still sinking the winze below the 640 level.

ANDES.—Drifting on the 240 and 350 levels.

Bullion Hill District.

ARRANGING FOR A BOND.—Eureka *Sentinel*, Jan. 5: Mr. Cassidy has been endeavoring to bond the Silver Gray mine of Bullion Hill district, Lander county. The Silver Gray is the property of Dave Cozzens of Battle Mountain. It is said to be one of the best mines in that section. The ledge is well defined and the ore of high grade. The parties had about agreed upon the terms of the bond at latest accounts. The figures are understood to be well up toward a hundred thousand.

Eureka District.

A GOOD ASSAY.—*Sentinel*, Jan. 5: Spots and blotches of heavy galena have been met with from the very start in the new Diamond tunnel. A sample of it sent over to Mr. McIntosh, at Salt Lake, assayed 59 per cent lead and $127 to the ton in silver. Of course it is only important as showing that the lime is highly mineralized at that point. To this extent it is very encouraging. Indeed every person who has seen the Diamond bonanza believes that it is one of the most valuable discoveries ever made in this district. Three or four months' work may tell an important tale for the future of this camp. The work going forward in the Diamond this winter is about the only thing doing here that gives any promise of lifting the old town out of the dumps.

Pioche District.

BONDED.—Pioche *Record*, Jan. 2: Thomas McMahon has bonded to S. T. Godbe, for six months, the Half Moon, Columbia, Rainbow and War Eagle mining claim, situated in this district, about three miles west from town. The consideration mentioned in the bond is $15,000, of which amount $1000 was paid in cash. The claims adjoin the Chisholm mine and a good body of ore is exposed to view, the work of developing which will be continued by McMahon during the existence of the bond, unless stopped by a consummation of the transaction and full payment of the amount, which may occur.

YUBA.—The work of development at the Yuba steadily progresses, every week showing up the mine in a better light. Drifting progresses on the 11th and 12th levels to determine the extent of the ore body on the strike of the vein at those points. The extent of the ore is not exactly known on any level from the 8th to the 12th, though it is developed for over 200 feet on some of them. The ore at the bottom of the 12th level drift is exceptionally fine, and sinking on it will be commenced in a day or two. From lack of teams and also on account of bad weather, the shipments of ore the past week are light.

Safford District.

STILL IMPROVING.—Eureka *Sentinel*, Jan. 5: The *Sentinel* has word that the late find in the old Onondago mine is still improving. Supt. George O'Briter has great faith in the property. The winze which is being carried down below the tunnel level is showing exceedingly well in high-grade ore, a good deal of which goes above $200 to the ton. There has been a marked change in the appearance and character of the ore as depth is attained. It is now thought that the water level is about reached where the ledge assumes a more compact form, as well as being of higher grade. No shipments of ore are being made for the winter.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Jan. 5: East crosscut from north drift, 250-foot level, extended ten feet.

COMBINATION SHAFT.—The new hoisting works have been completed. Sinking will be resumed in the bottom of the shaft.

NORTH BELLE ISLE.—South intermediate from No. 1 winze, 300-foot level, extended four feet; face shows a good width of ore.

GRAND PRIZE.—400-foot level: Crosscut has been extended 20 feet. Formation has been more favorable for making progress the past few days.

FOUND TREASURE.—Branch drift, 150-foot level, has been extended five feet; total, ten feet. The ground is very heavy and requires large timbers.

NAVAJO.—The upraise opposite the shaft on the west vein, 150 level, extended seven feet, still showing a fair width of ore. The stopes above the 350-foot level are looking well. Everything about mine and mill running smoothly.

NEVADA QUEEN.—North drift, 450-foot level, has been advanced 20 feet, showing some spots of mineral in the vein, and looks more favorable than heretofore. The stopes are yielding some good concentrating ore; 100 tons hoisted during the week. Chloride stope above the 100-foot level is narrow, but good ore. The concentrator has been running steadily and doing good work. The cold weather interferes with the running, but not enough but what it has been kept going steadily. Concentrations are clean and show well.

COMMONWEALTH.—100-foot level: North intermediate drift is being timbered. West intermediate drift: A winze has been sunk ten feet following a seam of good ore. 150-foot level: Upraise from No. 3 west crosscut has extended up eight feet. Assays from the top of raise give returns of $55 per ton.

Tybo District.

DIMICK.—Belmont *Courier*, Jan. 2: Work goes on as usual in the Dimick mine. The ore encountered in this mine is of a good grade.

ARIZONA.

VARIOUS CAMPS.—Arizona *Journal-Miner*, Jan. 2: Talk is that the Etta mill will start up soon again. Louis Himmelreich went out to-day to Copper Basin to erect the new smelter for that company. A smelter will probably be erected in Big Bug early in the spring, for the reduction of ores from that district. The Crowned King Co. has closed down for a short time, to add pans and settlers to its reduction plant. The United Verde has temporarily closed down on account of bad roads. The rumored sale of the United Verde copper mines to W. A. Clark has been confirmed. Frank Dolph, manager of the Oro Fino placer mines on the Hassayampa, says there is plenty of water there for washing out gravel at present. Sam F. Powell writes from the lower Hassayampa that new strikes are being made every day in the district discovered by him some time since, and a big camp is expected to be located there within a year. The main shaft on the Congress mine was sunk during the past year to a depth of nearly 600 feet. Six other shafts have also been sunk on other claims owned by the company, aggregating in all 630 feet of work, the deepest shaft being 225 feet. They have also run levels aggregating 1300 feet, but have done but little stoping. From the above workings they have shipped over 600 tons of ore, aggregating in value over $100,000, while it is estimated that the dumps contain 5000 tons of second-class ore, which will average $50 per ton. I. T. Stoddard of the Oro Bella Mining Co. says the company had its sawmill in operation cutting lumber for its new mill. He says the mines are looking splendid. Quite a large body of high-grade ore was encountered last week in one of their openings. F. M. Murphy returned last evening from a trip to Lynx creek and the head of the Hassayampa. He says there is a large amount of water in the former stream at present, while at the divide at its head he found 18 inches of well-packed snow. This is good news for the mining interests of that section, as it will furnish an abundance of water for placer mining all along the creek, and will also enable the Lynx creek hydraulic works, the greatest producer of placer gold in this section, to have water for a long run this season, which means the production of several thousand dollars.

COLORADO.

SALE.—Georgetown *Courier*, Jan. 3: A sale of Leavenworth Mountain group of lodes was completed on the last day of the old year. The group consists of the Good Hope, Lebanon, Big Blue and Midas lodes, one-half of the Silver Dale tunnel, No. 4 lode, and one-half of the Silver Dale tunnel,

owned by George L. Sites. The purchasers are George Crawford of Pittsburg, Penn., and H. H. Warner of Rochester, N. Y. The consideration was $49,000. The Astor Alliance group of mines was sold at sheriff's sale last Saturday and bid in by G. W. Hall for $19,900. This was the nominal sum necessary to satisfy some debts held against the property. The company will doubtless redeem. In the first place this group was fairly flooded with watered stock. The properties of the Clear Creek Mining and Improvement Co. were sold under a judgment in favor of J. Warren Brown for some $10,000 on Saturday. It is to be hoped that the Clear Creek, the Republican and the Lebanon properties will be consolidated and thoroughly explored by one central system of development. These mines embrace the entire south slope of Republican mountain from the Pay Rock properties to the south line of Georgetown. All have yielded rich mineral in large quantities, and with the large mill now contemplated and a union of working forces, this property will be as great in dividends as it is in size.

IDAHO.

THE HUB MINE.—Wood River *Times*, Jan. 2: The Hub mine, near Era, continues to show better with every foot of development work done upon it. Most of the work the past season has been done with a view to open the property and work it economically. A good hoist has been put in place and other improvements made, and preparations completed with a view to sinking an additional hundred feet this winter, and driving 200 or 300 feet of drifts. A short while back the owners began shipping ore in order to lay in their winter supplies. The teams take ore to Nicholia and bring supplies back. They have only hauled about $5000 worth so far, but this will suffice for the present. In extracting this shipping ore, some 350 to 400 tons of 60 to 80-ounce ore was taken out and thrown over the dump. The work done indicates that the workings are in the top of an ore body that must be both rich and extensive. If this be demonstrated this winter, a mill will be erected in the spring.

THE CHARLES DICKENS. — Ketchum *Keystone*, Jan. 5: We learn from parties over from Custer county that the London syndicate, which, as the Charles Dickens Company, purchased the controlling interest in the Charles Dickens mine some time ago, have now obtained complete ownership of that property. When the company was organized and the purchase first made, some of the original owners did not take stock, and debenture bonds were issued to them to secure their interests. Not long ago a suit on the mine in the interest of these bonds was commenced. To avoid litigation and to obtain full possession of the property, the company purchased those debentures themselves. This is a matter of great importance to Bonanza, as well as to the company, for this valuable property has lain idle over a year on account of trouble with parties holding these debentures, and now it is understood that Mr. Treweek, the manager, intends to begin active operations in the spring for fully developing the mine, which fact will give new impetus to mining in that locality. The company is now known as the Dickens-Custer Co., the Dickens and Custer properties having been consolidated nearly a year ago. The company has been running its 30-stamp mill since February, and turning out about $30,000 per month in bullion. They have been running on Lucky Boy ore, which for the month of November averaged $51.11 per ton. The ore in this mine improves with depth, and in the new winze from the lower tunnel, they have gone down 40 feet, through solid ore all the way. A piece was brought into Bonanza a short time since, weighing 80 pounds, which assayed 77 ounces in silver and $100 in gold per ton.

EVOLUTION DISTRICT.—Wardner *News*, Jan. 3: The Polaris mine, owned by W. B. Heyburn and L. Matheson, is a property of which but little mention has been made of late, although more work has been done on it than any other mine, outside of the extensively developed properties of the South Fork. It has a tunnel to a distance of 600 feet, two crosscuts running north and south, each one extending 100 feet, a winze sunk to a depth of 100 feet with 125 feet of drifting on same, besides numerous stopes. Work is steadily progressing and from the quality and quantity of ore in sight this mine should rank among our best ore-producers. It is conveniently located and has the advantage of a finely graded road three miles long connecting with the railroad and built at a cost of $3000.

HUNTER CONCENTRATOR.—Work on the erection of the Hunter 100-ton concentrator is being pushed with energy; the structure is now roofed and the machinery is being put in place as rapidly as possible. Most of the plant is on the ground and the remaining portions are en route to Mullan. The concentrator will be run by water-power, the air-compressor by steam, and the entire works will be lighted by electricity. Mr. Storr, superintendent of constructions, will be ready to turn the mill and all work under his control over to the company by February 15th.

MONTANA.

THE JAY HAWK.—Montana *Mining Review*, Jan. 2: The Jay Hawk Mining Company, in the Jay Gould district, have their machinery on the ground for a ten-stamp mill, which will be put up and set at work as soon as the weather will permit. The air compressor, running Burleigh drills, is now at work in the tunnel, which is 1400 feet long.

IN GOOD DEMAND.—Lead ores are in good demand now, and the bidding for them by the rival establishments spirited. Small shipments are going forward to the Montana company's smelter or the Helena smelter every day.

THE LITTLE BONANZA.—Work is progressing on the Little Bonanza lode, in the Helena district, but some difficulty is being experienced with surface water in sinking, which in the absence of a pump is difficult to overcome, although the contractors think they may be able to finish the 20-foot contract with the limited facilities at hand. Only three feet of additional depth has thus far been secured, but the vein shows a big improvement, some ore being already in sight, and increasing in quantity with every foot of depth.

PLACERS.—Boulder *Age*, Jan. 3: It is reported that the Mitchell gulch placer mines have been placed under bond and that a wealthy company will take hold of the mines next season and make extensive developments. The Minah mine is under examination by various experts preliminary to a sale. The price is said to be three-quarters of a million dollars, and it is said that if the next report of the expert is favorable, the sale will be perfected. Rumors of the sale of the Elkhorn Mining Co.'s property have been current for some time, but nothing definite has yet been given out, though it is evident that negotiations for the sale of the mill and mines are in progress.

NEW MEXICO.

BENNETT. -Rio Grande *Republican*, Jan. 7: The Bennett mine starts up with a force large enough to take 35 tons of ore from the mine daily, and one who has seen the mine lately will not doubt but it is capable of producing more ore than that.

LOST MINES.—In the Organs there are, scattered at various points along the range, a number of spots where the Mexicans in early days have erected their primitive smelters, and the ruins still exist. It is said that ore of very high grade is found near them, different from anything ever discovered in the camp, and it is thought that it comes from some point in the mountains and will yet be found.

OREGON.

PLACER STRIKE.—Bedrock *Democrat*, Jan. 1: So often is it reported that "rich strikes" in quartz or placer have been made here and there that the public have learned to give these rumors but little credence from the fact that too frequently it occurs that these reports are originated by over-zealous and imaginary persons and have no foundation in fact. It often happens, however, that there is more "truth than poetry" in some of the reports sent out and we are led to believe that the "rich strike" which heads this column is worthy of belief from the fact that responsible persons assure the reporter that it is true from personal observation. The strike in question was made a short time since on Powder river, south of Sparta, and near the old quartz-mill, but the knowledge of the existence of rich gravel deposits in this locality was kept from the public until those on the "inside" had perfected their locations. This done and now the news is given to the world. The principal locators on the ground are Messrs. O. S. Buckland, E. E. Clough, Henry Wilkinson, Wm. Ainsworth, Jay Guy Lewis, and others who have taken up the entire ground for miles in length along Powder river from the old mill south. Our informant tells us that four Chinamen in the employ of O. S. Buckland in one week's time took out upward of $1600 and that nuggets weighing as high as $30 had been found. The excitement at Sparta over the rich finds is intense and it is said these mines are the richest ever discovered in Eastern Oregon. The location of these mines for working is excellent, as plenty of water can be had from Powder river. That these rich gravel deposits should have lain uncovered and unmolested by the pick and shovel for all these years, while the gulches a few miles north are worked out, is a mystery, but it is one of those unaccountable happenings for which no explanation can be offered.

UTAH.

THE NEW LAST CHANCE.—Salt Lake *Tribune*, Jan. 3: The English company owning the New Last Chance mining property, at Bingham, have cabled Mr. Theodore Bruback to take charge of the property and push work on it. Yesterday he went to Bingham and set teams to hauling coal to the new concentrating-mill; took a look through the mine and returned to the city in the evening. He will get a force of men at once and have the mill running in a few days. There is a large quantity of concentrating ore ready to run through the mill, and it is proposed to keep the machinery and mine at work steadily after once starting. Mr. Bruback will give the property his attention for the present, and if he can find time away from his railway business, will continue to manage it. He expects to extend the San Pete railway down the valley and get in all the new mileage he can this year.

FRISCO AND COPPER GULCH. — A Happy New Year struck the town of Frisco and Copper Gulch for the first time in five years, happy because a new enterprise that would give employment to many this winter had been inaugurated. The French Copper Co., now known as the Comet Mining and Smelting Co., have nearly completed their smelting plant, which is a model of neatness and adaptability. Mr. Carl Henrich has charge of the smelting part, Mr. Jones the construction. While the management of the mines is in the hands of the Morrensen Bros., Professor Sebillot has charge over all. The Massachusetts mine, now owned and being worked by this company, has a fine showing of copper ore. A new tunnel is being driven into this mine which will strike the ore body at great depth and expose large bodies of copper ores of a good smelting quality. Near by and adjoining this mine is the Quartize No. 2, now owned by Gen. Solomon of Salt Lake, which shows a large body of copper ore. There are also a number of copper claims further to the northeast, owned by James Hedges. In Lober canyon are the Broadway mine, Niagara, Cambria and a number of other claims that have a good showing of copper; in fact, there is lots of copper ore existing all through San Francisco district, which only needs capital and muscle to develop it.

PARK NOTES. — *Record*, Jan. 5: The Russell leaching process is doing most satisfactory work at the Marsac mill. Rather slow progress is being made now in driving the Ontario's big eastern drain tunnel, because of the soft ground encountered. The Woodside tunnel is being pushed with vigor, and the contract will be completed in a couple of weeks. It will tap the ore body at depth and open up a vast amount of stoping ground. It is now asserted that the reorganization of the Sampson company will be perfected in about a month under the name of the Alliance Mining Co. Heavy shipments of first-class ore would be made from the Crescent mine now if the roads were only in condition for hauling by sleds.

ORE AND BULLION SHIPMENTS. — During the week the Mackintosh sampler received 58,160 pounds of Ontario ore, 214,400 of Daly and 909,790 of Woodside leasers' ore; total 1,182,350 pounds. Last Monday the Ontario shipped 43 cars of bullion containing 23,839.79 fine ounces of silver. Twelve bars of Daly bullion, 12,045 fine ounces of silver, were shipped from the Marsac mill last Monday.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Jan. 10, 1889.

The past week showed a slight improvement in general trade, due chiefly to more settled weather. It is confidently asserted that the spring trade will be the largest on record, owing to light stocks with the trade and extended rains in all parts of the State inspiring a more confident feeling among all classes. The money market, not only here but in all leading centers on the coast, is exhibiting a remarkable ease for so early in the month of January. In this city large sums are being disbursed in dividends and on interest accounts. This is tending to create more ease, which is very materially aided by stockbrokers, who usually borrow large sums of money, not only reducing their accounts, but the majority having a cash balance to their credit. It is claimed that this condition will not likely be changed for a few days yet, or until stocks begin to show more activity in an upward direction. This is expected in the near future, or soon after the Sutro tunnel is sold, which will probably be on next Monday, and the new reorganized company take possession. The new company, it is understood, consists largely of Eastern capitalists. From the various mining districts, the mines of which are listed on the two stock exchanges, information is of a most flattering character, with every probability of important developments being made within the next few weeks. From the private mines in this State and adjoining States and Territories, the advices continue of a very favorable character, with an active season looked for.

SILVER—The market held steady at 92⅞@93c up to Monday, when an advance was established in sympathy with an upward movement abroad. The obtainable supply of silver bullion in this market is light, and as there is a good demand, buyers are compelled to pay from ½ to ⅝c on ounce above New York quotations. The silver-producing mines are not, as yet, turning out as much bullion as was expected, but the outlook is said to be favorable for a gradual increase from now on. Sales of silver were made in this market at 93¼c on Monday and 93⅜c on Tuesday. Yesterday, Wednesday, buyers bid 93⅛c in sympathy with a decline at the East and also abroad. Silver shaded off to-day in London to 42½d and in New York to 92⅞c. In our market 92⅞c is bid, although an advance, it is claimed, would be paid on this price.

QUICKSILVER—The market is very active for both home and export. China is drawing more freely. This coast's mines are said to be taking more than at this time in 1888.

LEAD—The market is lower, with a weak tone at the close. For March and April delivery, pig lead has been sold at 4⅛c.

TIN—Pig tin is weak and lower. The demand for spot parcels is slow. Tin plate on spot is dull, but a revival of the inquiry is looked for in next month. For March and April delivery, prices are reported to be steady.

BORAX—The market is without essential change.

IRON—There is nothing new to report. Ironworkers and foundrymen look for quite an active season, but as yet they are not disposed to anticipate their wants. Considerable work has been and is being figured on by the foundrymen, but as yet very little active business has followed. The market for iron is reported to be quiet but firm.

COKE—The market is very strong for spot parcels, under limited supplies. Consumers, at the high prices, buy sparingly.

COAL—The market for spot parcels is claimed to be firm for both steam and household. Importations continue quite free, with more Rocky mountain coals coming to hand. The coast collieries output continues large. Australian coals for shipment in April and May are offered at $7.25 a ton.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Jan. 10, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	92⅜	$17 25	$3 95	$21 80
Friday	42½	92⅜	17 30	3 90	21 85
Saturday	42½	92⅛	17 30	3 90	21 85
Monday	42 11-16	93⅛	17 35	3 87½	21 90
Tuesday	42 11-16	93⅛	17 35	3 87½	21 85
Wednesday	42 9-16	93	17 40	3 85	21 80

Borax is firm, with a stronger feeling. Lake copper was quiet and sold nominally at $17.15@17.25. For the first three months of the year 1888 the output was 54,275 tons; in 1887, 47,633 tons. Eight hundred and thirty tons of pig lead was sold by auction at $3.85½@3.86, and in regular market at about $3 90. Petroleum is lower than for a long period. Barrels, $7@6.90; plain cases, $9.

Mining Share Market.

Mining stocks were more active during the latter part of the week than has been the case for some time, a large amount of stock changing hands at an advance. Tuesday's Virginia *Chronicle* says: Unless the Carson river flow should be materially impeded by freezing, the Con. Cal. and Virginia Co. will take out sufficient bullion the present month to cover operating expenses and pay a dividend in February.

The following mining companies had cash on hand Jan. 7th: Alpha, $22,771; Alta, $40,906; Andes, $17,142; Belcher, $3998; Best and Belcher, $8661; Benton Con., $96,564; Bulwer, $5016; Bodie Con., $47,973; Bullion, $37,099; Caledonia, $14,226; Con. California, $191,076; Con. Imperial, $21,491; Confidence, $67,136; Crocker, $2579; Del Monte, $4756; Exchequer, $13,313; Found Treasure, $1161; Gould and Curry, $3105; Hale and Norcross, $14,612; Independence, $2825; Julia, $691; Justice, $15,000; Lady Washington, $24,508; Locomotive, $2560; Mexican, $8855; Mono, $21,056; Navajo, $38,869; Ophir, $26,663; Overman, $6480; Scorpion, $1094; Standard, $1614; Silver Hill, $12,542; Silver King, $70,000; Sierra Nevada, $10,783; Summit, $1830; Syndicate, $9056; Utah Con., $12,229; Weldon, $2035.

The following mines were in debt January 7th: Belle Isle, $1268; Challenge Con., $700; Chollar, $2661; Crown Point, $1604; Commonwealth, $57,314; Con. New York, $1262. Grand Prize, $32,597; Holmes, $2799. Kentuck, $946; Nevada Queen, $6312; North Belle Isle, $34 094; Peerless, $5637; Peer, $6110, Potosi, $10 270. Occidental, $6623; Savage, $49,376; Seg. Belcher, $31,056; Union Con., $4347.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JAN. 1, 1889.

395,616.—CARBURETOR—H. J. Dykes, Berkeley, Cal.

395,618. — CORK EXTRACTOR—Geo. Edwards, Berkeley, Cal.

395,433.—BEVEL GAUGE—M. O. Godding, Monrovia, Cal.

395,621.—DRIED-FRUIT CLEANER—John Harrel, Plymouth, Cal.

395,443.—CONDUIT ELECTRIC RAILWAY—B. Jennings, San Jose, Cal.

395,448.—PILE—R. B. Markle, Westport Cal.

395,449.—GAS APPARATUS—J. A. McCollum, Riverside, Cal.

395,401.—GREASE EXTRACTOR—W. D. Nelson, S. F.

395,344.—FURNACE—J. P. Oliver, Oakland, Cal.

395,340.—COUGH MIXTURE A. M. Poe, Lakeport, Cal.

395,587.—VINEYARD CULTIVATOR—C. Rebman, Napa, Cal.

395,349.—MOWER—Redfield & Hansbro, Glendale, Ogn.

395,460.—OIL-FEED FOR LAMPS—C. Sieghold, Salinas, Cal.

395,680.—ROTARY BOLT—G. Summerton, S. F.

395,411.—CATAMENIAL SACK—Emma A. Wiley, Los Angeles, Cal.

395,642.—WIRE SPLICER AND CUTTER—H. V. Wulbecke, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PILE.—**Robert B. Markle, Westport, Mendocino Co. No. 395,448. Dated Jan. 1, 1889. This novel construction for piles consists in building up a pile of boards or strips with intermediate layers of a preservative compound, the strips being so placed with relation to each other that the edges and sides of all the strips, except the outer ones, are inclosed and protected by the preservative compound. The outer surface may also be coated with any suitable compound; or, if left unprotected, the insects can only burrow into the thickness of this exterior coating, not being able to penetrate the intermediate compound placed between this and the next interior layer of strips.**

WIRE SPLICER AND CUTTER.—**Henry V. Wulbecke, S. F. No. 395,642. Dated Jan. 1, 1889. The object of this new and useful implement is to twist the overlapping ends of wire to form the splice and to cut off wire when necessary. It consists in a stock having a novel head forming a bearing by which the implement is journaled or pivoted upon the body of the wire, and having on the side of said head a curved guide for receiving the free end of the opposing wire and twisting it around the first wire on which the head is journaled. It consists further in a handle having a cutting blade pivoted to it for the purpose of clipping off the ends or other portions of the wire.**

ROTARY BOLT.—**Geo. Summerton, S. F. No. 395,680. Dated Jan. 1, 1889. This is an improvement in bolting machines for flour and other materials, and is especially designed to provide a more effective shaking and bolting motion of the apparatus, and an adjustment of the parts. This is effected by peculiarly arranged hangers from which the bolt shaft is suspended, with cams and springs to produce the proper oscillation without deranging the rotary motion, and mechanism whereby the movements are steadied, and the amount of shake is limited and adjusted so that the rate of travel of the material through the bolt is controlled.**

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Cons. California and Virginia, Jan. 5, $91,735; Hale and Norcross, 5, $87,488; Confidence, 5, $17,000; Overman, 7, $7540; Eureka Con., 7, $27,800; Peerless, 7, $8650; total for December $14,535; Mt. Diablo, 7, $5901; Blue Bird, 5, $33,280; Alice, 5, $26,312; Lexington, 5, $35,104; Butte & Boston, 5, $33,200; Moulton, 5, $106,240; Navajo, 7, $12,000; Hanauer, 3, $2000; Woodside, 3, $6600.

THE New York *Times* says editorially: **It is reported in Boston on credible authority that the copper syndicate has very recently closed a contract with J. B. Haggin, owner of the Anaconda mine, for two years, with the privilege of extending it for 12 years.**

E. E. EYRE, President. JOS. H. GRAHAM, Vice-Pres. & Manager. G. M. PINCKARD, Sec'y.

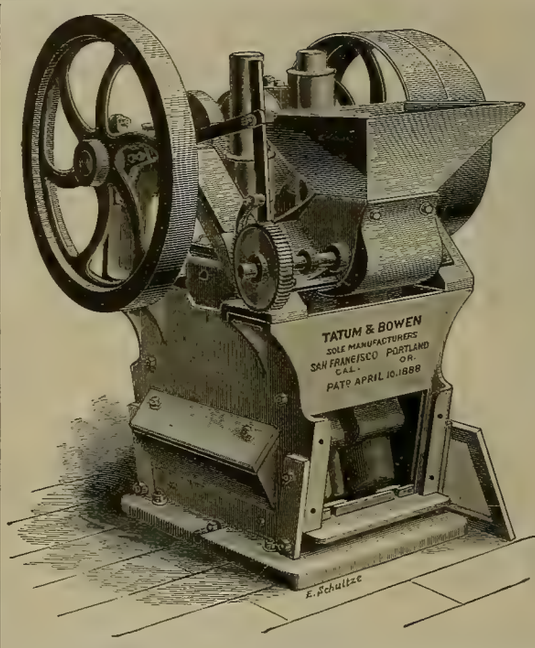
San Francisco.



—THE—

PERFECTED DOUBLE Economic Stamp Mill.

BEST and CHEAPEST

In the World.

AFTER SEVERAL YEARS OF EXPERIENCE we have finally perfected this Mill. Our principal improvement consists in oscillating the stamps by means of sleeves with universal joints, allowing the stamps the utmost freedom of movement, without tendency to bind or cramp in the working parts.

Several Mines Using Them Have Ordered Others.

WE HAVE ALSO

A NEW ROCK BREAKER.

CIRCULARS WILL SOON BE READY.

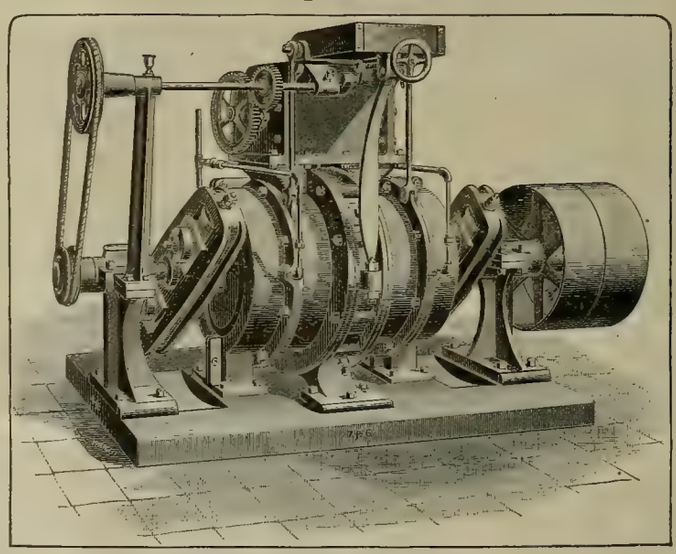
TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,

Manufacturers and Dealers in Machinery of all Kinds.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

STURTEVANT MILL.

This Mill as a Crusher and Pulverizer is without rival. Is in operation in eading smelting works and mills.

SEND FOR CATALOGUE AND TESTIMONIALS.

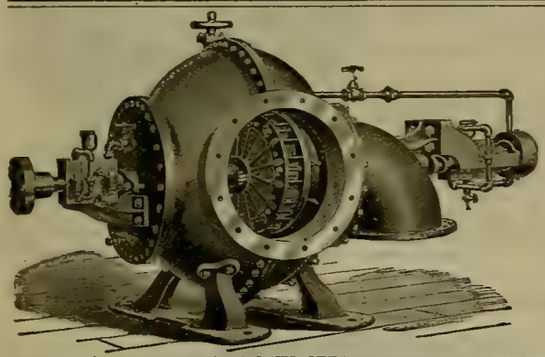
UTAH OFFICE—SALT LAKE CITY, UTAH.



JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO., Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

ENLARGED!

RAND, McNALLY & CO.'S

BUSINESS ATLAS,

1889.

WILL BE DOUBLE THE SIZE OF ANY OTHER ATLAS PUBLISHED.

New Size of Page, 15x21 Inches.

It will contain new large scale maps occupying two pages only (no cut-up maps) of all the important States The entire arrangement will be new, embodying the most improved methods of reference and indexing, clearly showing the location, population and commercial advantages of over 200,000 towns in the United States, Canada and Mexico.

RAND, McNALLY & CO., 148 Monroe St., CHICAGO.

The BUYERS' GUIDE is issued March and Sept., each year. It is an encyclopedia of useful information for all who purchase the luxuries or the necessities of life. We can clothe you and furnish you with all the necessary and unnecessary appliances to ride, walk, dance, sleep, eat, fish, hunt, work, go to church, or stay at home, and in various sizes, styles and quantities. Just figure out what is required to do all these things COMFORTABLY, and you can make a fair estimate of the value of the BUYERS' GUIDE, which will be sent upon receipt of 10 cents to pay postage,
MONTGOMERY WARD & CO.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A F. JEWETT—Tulare Co
F. B. LOGAN—Southern California.
H. G. PARSONS—Northern California.
GEO. WILSON—Sacramento Co.
W. W. THEOBALDS—San Diego Co.
JOHN L. DOYLE—Napa Co
J. C. HOAG—San Francisco.
J. G. H. LAMPADIUS—San Francisco.

THE Southern Pacific Company has purchased Stone's coal mine in Slack's canyon, Monterey county, for $75,000.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Lesler, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 94 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Secy.

DIVIDEND NOTICE.

The German Savings and Loan Society,
526 California Street.

For the half-year ending December 31, 1888, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on Term Deposits, and four and one-fourth (4¼) per cent per annum on Ordinary Deposits. Payable on and after Wednesday, January 2 ,1889.

GEO. TOURNY, Secretary.

FOR SALE.

The Empire Foundry and Machine Shop in the city of Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., etc., will be sold on easy terms. A first-rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address
R. HOSKIN, Marysville.

Assessment Notices.

Lord of Lorn Gold and Silver Mining Company. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Gold Hill Mining District, State of Nevada.

NOTICE is hereby given, that at a meeting of the Board of Directors, held on the 19th day of December, 1888, an Assessment (No. 4) of Ten (10) Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 313 California street, San Francisco, California. Any stock upon which this Assessment shall remain unpaid on the 21st day of January, 1889, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday, the 11th day of February, 1889, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

L. G. HARVEY, Secretary.
OFFICE—313 California St., San Francisco, Cal.

STOCKHOLDERS' MEETING.

OFFICE OF
The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, San Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 18, 1889, at 3 o'clock P. M. By order of the Board of Directors.

J. M BUFFINGTON, Secretary.
OFFICE—Room 11, No. 303 California Street, San Francisco, California.

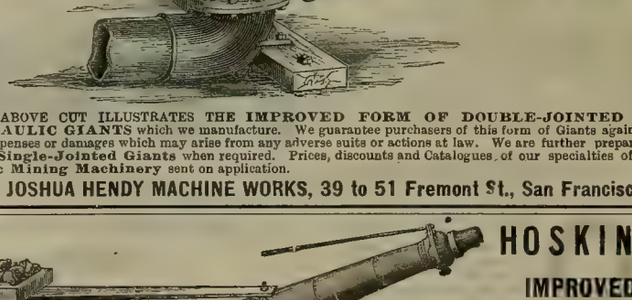
DEWEY & CO.'S

Scientific Press **Patent Agency.**

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish **Single-Jointed Giants** when required. Prices, discounts and Catalogues of our specialties of **Hydraulic Mining Machinery** sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

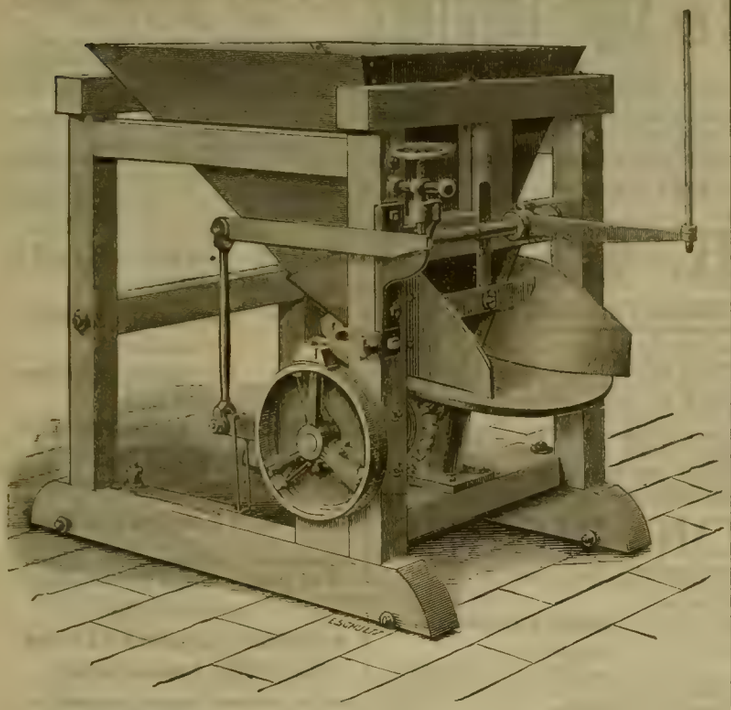
HOSKIN'S
IMPROVED
ONE-JOINTED
HYDRAULIC MACHINE.

The statement of Mr Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. **R. HOSKIN, Empire Foundry, Marysville, Cal.**

—THE—

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised**, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

THE DUCKER PORTABLE HOUSES

Combine all the comforts and advantages of a permanent building with the qualities of **Simplicity, Stability, Lightness, Ease of Transportation, Quickness of Putting Up and Taking Down, Ventilation, Heating,** and **Facility for Cleansing.** Equally serviceable for **Contractors' Uses,** for **Sheep** and **Cattle Ranches, Mining Camps** and for **Surveyors** and **Prospectors, Hospitals, Seaside** and **Summer Resorts,** and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to change location. These Buildings can be especially constructed for **Hunting** and **Fishing Camps, Billiard Rooms, Photographers' Studios** and **Lawn Pavilions.** They are built in sections and are put up without the use of screws, nails or any external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time without skilled labor. Price, **$250** to **$750. Thoroughly reliable and influential business men only,** may communicate with this Company relative to acting as its representative.

Address DUCKER PORTABLE HOUSE COMPANY, 32 Nassau St., New York.

Portland, Or. **Sydney, N. S. W.**

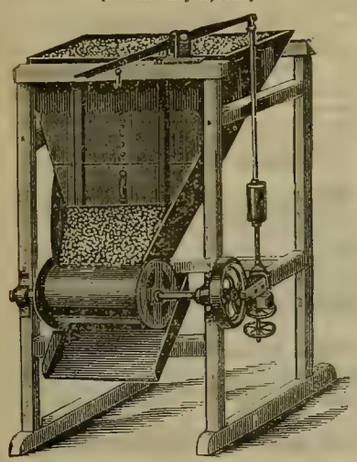
THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

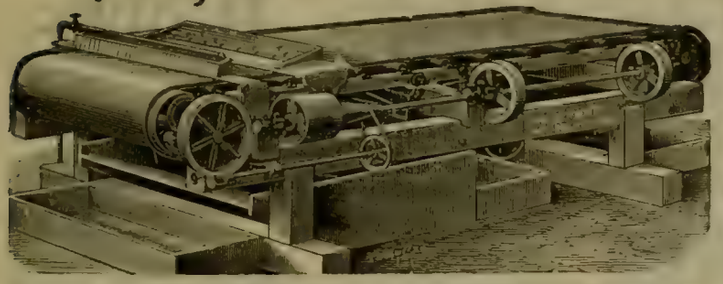
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS ($575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

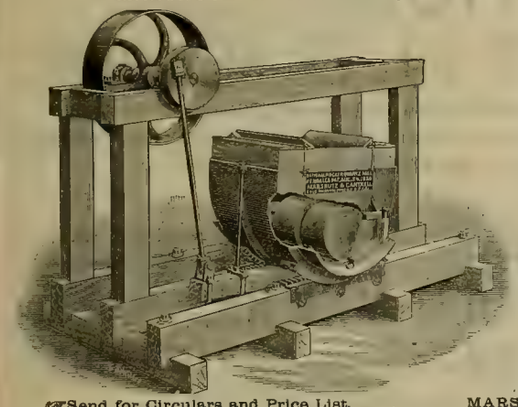
—MANUFACTURERS OF—
Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.
AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

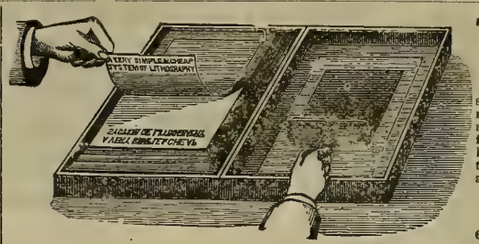


The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.



THE "ECLIPSE"
Copying Apparatus.

One thousand copies in black. No special pen, no special paper, no stencil required. The "Eclipse" reproduces the natural handwriting so exceedingly faithful that in most cases "Eclipse" circulars have been taken for ordinary written letters. Specimens and circulars on application.

FELIX F. DAUS & CO.,

54-INCH BY 16 FEET STEEL BOILERS IN 2 SHEETS.

STEAM USERS, ATTENTION!

The engraving represents our standard 54 in. x 16 ft. Boiler. These boilers are made of homogeneous STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are supplied with a small hand hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 54 inches diameter by 16 feet, with 46 3½ inch tubes; Shell, 5 16; Heads, 7-16.
1 Steam Drum, 36 inches diameter by 72 inches long.
1 Breeching.
1 Smokestack, 30 inches by 60 feet, Nos. 12 and 14 Iron.
300 feet galvanized strand for Guys.
1 C. I. Front, complete.
1 Foundation Plate for front.
1 Set Grate Bars for coal or wood.
1 Back Bar Bearer.
1 Ash Cleaning Door and Frame.
1 Back Arch Plate.
1 Set Binder Braces and Bolts for Brickwork.
1 Stand for back end of Boiler.
1 Steam Gauge and Syphon.
1 Glass Water Gauge, complete, with column and 3 Gauge Cocks.
1 Safety Valve.
1 Stop Valve.
1 Feed Valve.
1 Blow-off Valve.
1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds. Total weight of Boiler and fixtures, 17,000 pounds.

☞ BOILERS ON HAND READY FOR SHIPMENT. ☜ SEND FOR CIRCULARS.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

SAN FRANCISCO, SATURDAY, JANUARY 19, 1889.

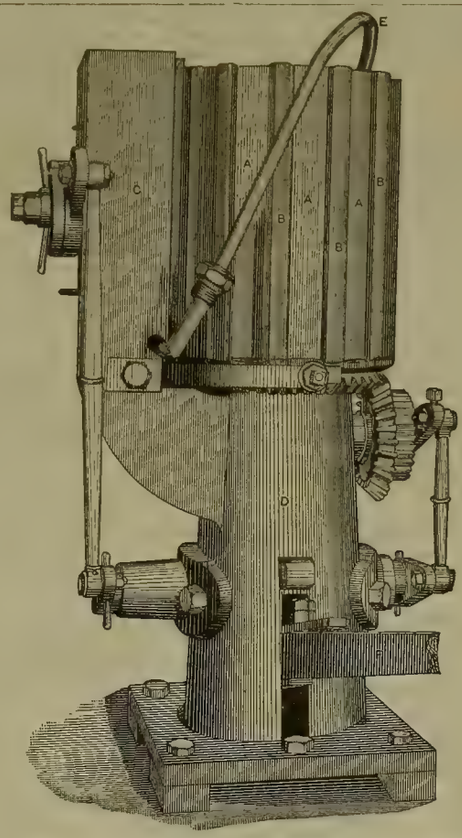
VOLUME LVII. Number 3.

The Sutro Tunnel.

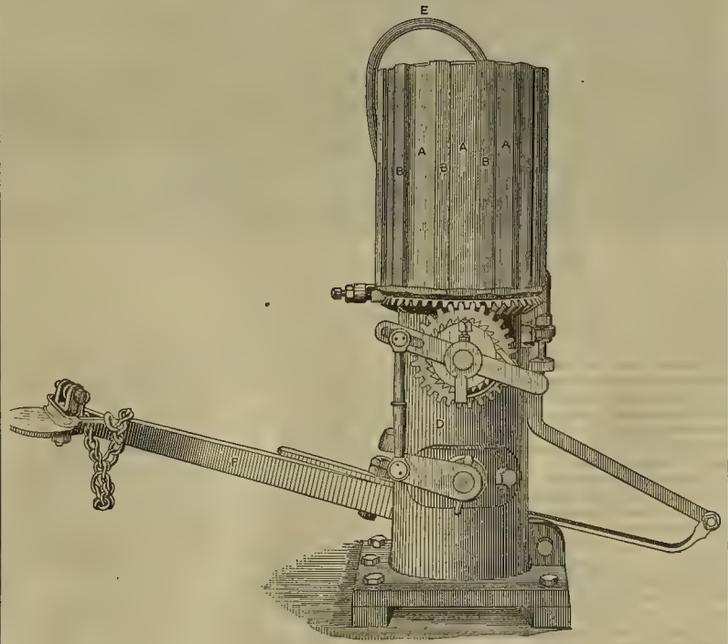
The sale of the Sutro tunnel, Virginia City, Nevada, under a decree of foreclosure granted by the United States Circuit Court at Carson City, Nevada, took place on Monday, January 14th. The property was bid in by Judge Henry C. Dibble for the Union Trust Company of New York, for the sum of $1,325,000. It is understood that the purchase was made in the interest of the old shareholders of the Sutro Tunnel Company, to whom it will be reconveyed. This sale, it is supposed, marks a new era of general prosperity for the mines at Virginia City, particularly so if the company pursues a more lenient course toward the mining companies whose properties are benefited by the tunnel. The royalty charged by the tunnel company of $1 a ton on all ore extracted, crushed or sold, yielding in bullion $40 a ton or under, and twice that amount on all ores yielding over $40 a ton in bullion, has, no doubt, been a serious drawback to a much larger quantity of ore being extracted and crushed. With the royalty reduced fully one-half and the cost of milling also reduced, about every mine on the Comstock can be advantageously worked, by which the tunnel company's revenue will be largely increased. Last year the income derived from royalty on ore extracted and crushed was nearly $300,000 and the total expenses incurred only about $80,000, leaving a very handsome net income—over 15 per cent a year interest on the cost, $1,325,000. It is claimed by mining experts and other authorities that there are on the lodes drained by the tunnel many billion tons of low-grade ore which can be made to pay a profit provided the royalty and cost of milling are reduced.

Aside from the royalty charge on all ores extracted that are crushed or sold, the Sutro Tunnel Co. has independent rights which will unquestionably make the property very valuable, not the least of which is that by Act of Congress, the company has the right to purchase all mineral veins within 2000 feet on each side of the tunnel, "cut, discovered, or developed" by it. This is the more important when it is understood that the right of way extends westerly for about seven miles from the mouth of the tunnel to and beyond the Comstock lode. In pursuance of the original object of the company, it is the intention to commence at an early day the extension of the tunnel to the west, toward the new mineral zone, now known to exist west of the Comstock lode. In doing this it will pass in a horizontal direction, at a depth of 3600 feet, the summit of Mt. Davidson. At this great depth many theories advanced concerning the veins or lodes at Virginia City will either be confirmed or disproved. This assertion has special reference to the depth, extent and richness in mineral ore of the veins found on the west side of Mt. Davidson. Shafts sunk on these veins showed them to dip eastward, and as depth was acquired, they were found to be widening and growing richer in gold.

ALVAN G. CLARK, the most famous maker of telescopic lenses in the country, was in the city this week on his way to Los Angeles to confer with the authorities of the University of Southern California with regard to making a 40-inch lens for a telescope, to be placed on Wilson's peak. He has just fitted up an instrument with a 20 inch lens at Denver, Col. He anticipates no trouble in making a 40 inch lens. Mr. Clark will visit the Lick Observatory while in California. He says that when last here he kept a record of the final tests made with the Lick lens, and out of five nights spent at Mt. Hamilton, four were infinitely better for astronomical observations than any one out of 70 nights spent in similar tests in Cambridge.



ROTARY MACHINE FOR MAKING SILVER INGOTS.



SIDE VIEW OF ROTARY INGOT MACHINE.

Silver Ingot Melting.

The method of making silver ingots at the mint at New Orleans is different from that employed at other mints in the world, the main distinguishing feature being the rotary ingot mold, which, though not a recent improvement, is comparatively unknown. There are four silver-ingot melting furnaces, standing in sets of two, and one crane and one ingot machine serves two furnaces. The appliances were described to the American Institute of Mining Engineers by F. F. Claussen, the assayer in the mint.

On a cast-iron platform 4½ feet by 8 feet in front of the furnace and 2½ feet above the floor, stands the rotary ingot machine shown in the accompanying engravings. The machine consists of a hollow vertical revolving cylinder of cast iron with slots, *AA*, cast on the outer circumference 12⅝ inches long, 1⅝ inches wide, and a half-inch deep, separated by lugs, *BB*, ⅝-inch wide extending the full hight of the cylinder. The slots are open at the top and outer side, and when closed by the block *C* form the molds for the standard silver-dollar ingots. The cylinder for this size of ingot has 12 molds on its circumference. It is supported by a cast-iron standard, *D*, and revolved by a gear-wheel bolted to its base.

The cast-iron block *C*, which closes the molds, has a motion to and from the cylinder of one-quarter inch. Both cylinder and block are kept cool by a half-inch stream of cold water *E* constantly flowing through them. This cooling is rendered necessary by the strong tendency of silver-copper alloys to segregate, and can only be partially overcome by cooling the ingot as quickly as possible after casting. The machine is operated by a foot-treadle.

The workman presses down the treadle, which first retracts the block from its position in contact with the lugs on the cylinder, where it has been left during and after the pouring of the preceding ingot; then rotates the cylinder one-twelfth of a revolution, bringing one of the molds on its circumference exactly opposite the block; then locks the cylinder in place, and finally releases the block from its retracted position, and allows it to be forced (by means of powerful steel springs) firmly against the lugs on the cylinder. So close a joint is obtained that no silver escapes through it, and only a slight feather-edge forms on the ingot after a cylinder has been in use for months. The silver is now poured into the open top of the mold, where, owing to the cooling by water, it immediately sets. The cylinder is again revolved as before, and the ingot at a dull red heat is exposed to view. This ingot remains in the mold until the third or fourth succeeding ingot is poured, when it is removed and placed in a cast-iron box.

The advantages derived from the use of the rotary ingot machine are obvious. Only four large furnaces are required, instead of a large number of small ones; the number of workmen required is also greatly reduced; and the weight of each melt is increased to an average of 8600 standard ounces, while by the hand-mold method the limit appears to have been reached at 3000 ounces, and the average weight by that method was about 2600 ounces.

THE Wellington coal mine strike has ended, the men having decided that all who could secure work should take it.

CORRESPONDENCE.

We admit unindorsed, opinions of correspondents.—EDS.

Debris and Tule — A Word for the Miner.

EDITORS PRESS:—I see that the Hydraulic Mining Commission is to meet this month, and I feel it my duty to say something in favor of the miner. In the years 1851–3 I traveled over all the debris section, and I was familiar with the different ranches on Bear river and the Yuba. Both rivers had very rich bottom land; farmers did well in summer, but the ground was so low that it was an accident if they got their stock out in the fall before the floods came down and carried houses, barns and stock into the bay. I know of one ranch that was served this way three years in succession. Then there was J. Bareham's place at the mouth of Bear river—he never could stay there through the winter, and stages had to abandon the Sacramento and Marysville route at the first heavy rains. Then there was a strip of tule from the American river to Fremont, from five to fifteen miles wide, and stretching from Suisun bay to the Buttes, all covered with water, besides many thousand acres on the Feather river, that were worthless, except in the driest part of the season. Marysville grew to be quite a city and you could see from 20 to 30 six and ten mule teams, and half as many pack trains loading every day.

This was all before hydraulic mining commenced.

Ten years after this, hydraulic mining was in full blast and run up to 1880. In the meantime the ranchers, fruit-growers and vegetable men were all getting rich. Marysville and Oroville were the most lively towns in the State; everybody was raising grain, hay and fruit to send to the mountains, and in every way prosperity reigned. But since the mines have shut down everything is dead; fruit is fed to the hogs, there is no demand for hay and grain in the mines, and Marysville has but one big team now where she used to have 20.

I will admit that the debris has done some damage to some farmers, but those men have lost all that they can, for their land, as well as thousands of acres of debris land, has been sold for taxes to lawyers, and they are the ones that have kicked more than any one else. The land as it is now makes splendid farms. The debris has filled all the low and uneven places along the Yuba, Feather and Bear rivers and all the tule between the American river and Fremont, besides filling a long way out toward Knights Landing, in some places eight feet deep; and I have always contended that there have been ten acres made where one has been spoiled.

There are plenty of farmers to-day whose land has been sub irrigated by the raising of the river-beds, so that they grow much better crops than they ever did before, but they have no market for what they do raise.

Now in "the fifties" I have seen the Sacramento valley full of water from mountain to mountain, when steamboats went all over the valley gathering up stock that had sought refuge on haystacks and people in trees and on house-tops. Then and there many a man wished there was a pile of debris around his house high enough to save his stock from floating down stream, when Sacramento had one little dry spot and Marysville had none less than six miles off.

Now, I believe that there are millions of acres of tule that could be made the finest agricultural land in the State, if proper care could be taken in depositing the debris in the low-lands by opening canals through the valleys, as is proposed by a late company organization to drain the Sacramento valley, so that private individuals can be benefited. This company will ask Congress to appropriate from $5 000,000 to $8,000,000 to defray the expense. Now, why have not the miners a better right to ask similar appropriations for a deposit for their tailings?

We are boasting of California's great mineral wealth, and sending grand specimens to foreign exhibitions, and making a great blow about it, and at the same time serving injunctions and keeping a vigilant watch over the miner, to see that he shan't work the mines. But, mind you, the miner has been at work for 15 or 20 years trying to open his mine. Knowing that it is rich, and that he has a fortune before him, he has worked early and late, through mud, rain and snow, to form companies to bring in water—some 10 miles, some 30 miles—to wash his ground, while his family has scarcely had the necessaries of life, and his children have gone barefooted in snow, eking out a miserable existence, awaiting the time they should have a fortune; and for fear of losing their claims, they had to buy their mining land from Government. Then, after all this, when they are ready to realize their anticipations, the Government—the very one that should have been their friend—says: "You shan't work your mines." I ask you how intelligent, law-abiding men and women feel at such treatment at the hands of their own Government.

Now these are facts; the miners are even willing to impound their debris; but no! you shan't even do that, when farmers have bought their tailings and are even fighting for them, doing as at Quincy. But no relief can be had. Now here is a wrong that should be righted; and it can be done by our Government carrying the debris down into the tules and making canals with plenty of openings, so that the current will eddy through and the mud will settle in the tules, and in due time the low grounds outside of the canals will be filled up to high-water mark. And this very same land, to-day worthless, will be one of the garden spots of California, and the miner who has survived will be made happy, and I hope independent. There is a wrong existing, and it should be righted by our Government.

For myself, I am not interested in hydraulicking, but am a quartz-miner and fruit-grower.

Petaluma, Jan. 10, 1889. A SUBSCRIBER.

On a Method of Assaying Copper.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

Some few years ago I briefly described in the columns of the PRESS a determination of copper in the form of xanthate, which was not quite correct. I then supposed the copper xanthate to be a cupric basic salt containing theoretically 32 95 per cent of copper, or empirically, by my experiments, 33 per cent. I have since ascertained that it is a cuprous compound, containing 34 85 per cent of copper, according to the formula given in Roscoe & Schorlemmer's chemistry.

When potassium xanthate is added to a cupric solution, the copper is reduced from the cupric to the cuprous state, and xanthic acid is oxidized, forming an oily liquid, which, being insoluble in water or aqueous solutions generally, remains entangled with the yellow, cuprous xanthate from which it is but imperfectly removed by washing with alcohol, in which it is soluble.

It was owing to this substance, which I supposed to be free xanthic acid, that I could not get my precipitate to contain more than 33 per cent of copper, even by washing it with alcohol, and as 33 per cent agreed practically with the formula for a basic cupric xanthate, I was led to adopt that erroneous view.

While the volumetric assay, as described in my handbook of assaying, Part III, can be made with accuracy in the ammoniacal cupric solution, the gravimetric determination requires that the copper be reduced to the cuprous state previous to the precipitation, in which case the oily matter is not produced.

My first attempts at obtaining a purely cuprous (*ammoniacal*) solution did not succeed; there was always some copper in the cupric state, and, consequently, always some of that troublesome oily matter. The best result I could get in this way was 34 44 per cent of copper in the precipitate, and that by a troublesome alcoholic washing. I have now succeeded perfectly by means of a different solution.

The copper is first brought into the state of an ammoniacal solution free from silver, lead, antimony, tin, bismuth, barium, strontium, iron and manganese, by easy means which are too well known to need description. The liquid is then rendered faintly acid by means of sulphuric or hydrochloric acid. Sodium sulphite and sodium thiosulphate (hyposulphite) in crystals are then added and dissolved until the liquid, in the absence of chromium, is perfectly colorless and quite clear. The object of using the sulphite is to dissolve any sulphur which may be liberated from the thiosulphate. If cadmium is present there may be a white precipitate, but this dissolves on addition of more thiosulphate. If chromium is present the solution will not become colorless, but if thiosulphate is used liberally and the liquid smells of sulphurous acid, the copper will be all reduced to the cuprous state, and on the addition of solution of potassium xanthate, which should not be too weak, in slight excess, will be completely precipitated.

The precipitate must be collected on a counterpoised filter, well washed with pure water, which is better if warm, dried on the water-bath and weighed on the filter. I prefer to wash, at last, with alcohol, as the precipitate then dries much faster.

Zinc, cadmium, manganese, if not entirely removed previously, chromium, arsenic, alumina, lime and magnesia do not interfere. Nickel and cobalt are precipitated with the copper; the former can be washed out by ammonia, the latter not. Hence, if cobalt is present in the assay the copper must be precipitated by iron, or otherwise, from the first acid solution, and then redissolved and determined.

My results in experimenting on pure copper are almost absolutely exact, and I am convinced that the method is as accurate as electrolysis, while more rapid and less troublesome in presence of arsenic, etc.

A solution of potassium xanthate can be kept in dark-colored or opaque bottles for a few weeks without decomposition. The crystals are stable and may be dissolved as required for use.

THE new chloride camp near Lake Pen d'Oreille is said to be one of the most promising in the Cœur d'Alene district. One of the veins has been bonded for $250,000. There are 100 prospects already located, and considerable excitement prevails.

THE Pacific Rolling Mill Co. has sued the Mission Transfer Company for $159,872.78 damages for the alleged breach of contract entered into in May, 1887, to furnish a quantity of crude petroleum.

The State Mining Bureau.

In his message to the Legislature, Governor Waterman has this to say concerning the State Mining Bureau:

Among the institutions of the State which aim to give information of a practical kind is the Mining Bureau. The objects contemplated by the Legislature in establishing the Bureau differ somewhat from those of any other institution in the United States. While recognizing the value of scientific research, the legislators concerned themselves more about the details of practical mining, and in defining the duties of the State Mineralogist indicated unmistakably the direction to which they desired his time and attention to be principally given.

The failure of the old Geological Survey to supply one volume of the economic geology of the State was a great disappointment and undoubtedly, in a measure, led to the refusal of the Legislature to make further appropriations to continue that survey, and in consequence the work was discontinued at a time when its continuance might have led to an authentic report on the subjects most sought for by the people.

The State Mineralogist is in no way incumbered by the Act creating the bureau. He may consistently go ahead with the work where the old survey left off, if sufficient funds are placed at his disposal, and I think such provision should be made.

Gold-mining should receive the fostering care of the State and the encouragement which it deserves. Until recently little or no attention has been paid to the fact that many valuable deposits of minerals other than the precious metals occur abundantly throughout the State undeveloped and not applied to any use, the existence of which has been made known through the efforts of the Mining Bureau.

We continue to be supplied with many crude minerals from foreign markets, notwithstanding they are largely distributed throughout the State, and materials manufactured from minerals continue to be imported which could be made at our very doors.

The collection of ores and minerals in the museum of the State Mining Bureau at San Francisco is a feature which proves the importance of the institution. It is arranged in a manner most convenient for the inspection, examination and comparison of the ores and minerals.

The economic ores and minerals exhibited can stand comparison with any other collection in the United States, and as a whole it is invaluable to the scientist, the miner and the student.

Since the last session of the Legislature, the State Mineralogist has submitted his seventh and eighth annual reports. The first is chiefly confined to the deposits of coal, petroleum and asphalt in the State. The eighth report is a comprehensive presentation of the mining being carried on in the State, and of the localities of many valuable economic minerals, and is replete with much-needed statistics and suggestions.

While on this subject, your attention is called to an Act amending the Act of April 16, 1880 (see Stats. 1885, p. 217), by providing for the appointment of a board of trustees to direct and control the affairs of the Bureau. Section 8 provides as follows: "The Board of Trustees may, with the assistance of the State Mineralogist, prepare a special collection of ores and minerals of California, to be sent to any world's fair, or exposition, at which they deem it desirable to display the mineral wealth of the State."

The importance of exhibiting our mineral wealth at the exposition to be held at Paris is generally recognized. The policy of making a special appropriation to the trustees for that purpose has been considered, and I give it my recommendation.

The Silver King.

The election of officers of the Silver King mine, Pinal county, Arizona, resulted in a victory for the Nevada bank people as against the Eastern stockholders. The directors are, W. S. Lyle, C. H. Fish, J. B. Low, H. H. Noble, and B. A. Barney.

At a subsequent meeting of the Board of Trustees H. H. Noble was elected president, Chas. H. Fish vice-president, Jos. Nash secretary, and Wm. S. Lyle general manager. Randolph Adams was elected superintendent. The secretary's financial statement was as follows:

Receipts—January 1st. Balance on hand, $27,924 30; sales of bullion during the year, $101,319 20; sales of concentrates, $441.713 58; assessment No. 1, $50,000. Total, $620,957.08.

Disbursements—Assaying, $456; expenses, $8127.66; law, $1505; insurance, $797.15; interest, $1946 45; freight, $19,605.74; merchandise and supplies, $41,028.99; superintendent's drafts on account of mine and mill, $531,206.19; balance cash on hand, $16,283.40.

On hand, 110,000 ounces of silver.

Liabilities—Superintendent's drafts unpaid, $18,147.76; merchandise account unpaid, $478.60; labor on mine (estimated) $11,000. Total, $29,626.36.

JOHN HOSKING, superintendent of the Plumas Eureka mine, died recently of pneumonia.

THE pay-roll of the Comstock mines for December amounted to $224,387.

The Legislature of 1889

Convened at Sacramento on Monday, 7th instant. The Senate was called to order by the president pro tem., S. M. White, of Los Angeles, who delivered an address eulogizing the late Gov. Bartlett and Senator Chandler. Mr. White was subsequently elected permanent President of the Senate, and Robert Howe of Sonoma Speaker of the Assembly, both being Democrats. Following are the Senatorial and Assembly districts and the counties constituting them, with the P. O. addresses of the members:

THE SENATE.

DIST.—NAME.	COUNTIES.	POST OFFICE.
1–Frank McGowan, *R*	Humboldt, Del Norte	Eureka
2–J. M Briceland, *D*	Trinity, Siskiu, Shasta, Shasta	
3–M. H. Meade, *D*	Modoc, Plumas, Lassen, Sierra	Logansville
4–A. F. Jones, *D*	Butte	Oroville
5–E. M. Preston, *R*	Nevada	Nevada City
6–A. Yell, *D*	Mendocino, Lake	Ukiah
7–Thomas Fraser, *R*	Placer, El Dorado	Placerville
8–John Boggs, *D*	Tehama, Colusa	Colusa
9–F. S. Sprague, *R*	Yolo, Napa	Woodland
10–E. C. Hinshaw, *D*	Sonoma	Bloomfield
11–G. J. Campbell, *R*	Solano	Vallejo
12–F. H Greely, *R*	Yuba, Sutter	Marysville
13–F. R. Dray, *R*	Sacramento	Sacramento
14–A. Caminetti, *D*	Amador, Calaveras	Jackson
15–F. C. DeLong, *R*	Marin, Contra Costa	Novato
16–F. J. Moffitt, *D*	Alameda	Oakland
17–W. F. Dargie, *R*	Alameda	Oakland
18–M. W. Dixon, *D*	Alameda	Harrisburg
19–J. W. Welch, *D*	San Francisco	670 Harrison
20–T. J. Pinder, *D*	San Francisco	321 Broadway
21–W. O. Banks, *R*	S. Francisco, 1419½ Washington	
22–J. N. E Wilson, *R*	San Francisco	1812 Pacific
23–W. H. William, *D*	San Francisco	115 Fifth
24–P. J. Murphy, *D*	San Francisco	29 Russ
25–J. E. Britt *D*	San Francisco	403 Eighth
26–T. H. McDonald, *D*	San Francisco, State Pg office	
27–John E. Hamill *D*	San Francisco, Stevenson B'ldg	
28–J. R. Spellacy, *D*	San Francisco	2529 Bryant
29–B. F Langford *D*	San Joaquin	Lodi
30–A. J. Meany, *D*	Merced, Stanislaus, Tuolumne	Merced
31–A. W. Crandall *R*	Santa Clara	San Jose
32–E. B Conklin, *R*	Santa Clara	Santa Clara
33–Joseph D. Byrnes, *R*	San Mateo, Santa Cruz, S Mateo	
34–Geo. C. Goucher, *D*	Mariposa, Fresno, Alpine Mono	Fresno
35–Thomas Flint, Jr., *R*	San Benito, Monterey, Hollister	
36–John Roth, *D*	Tulare Inyo Kern	Woodville
37–E. H. Heacock, *R*	S. L Obispo, S Barbara, Ventura	Santa Barbara
38–S. M. White, *D*	Los Angeles	Los Angeles
39–J. E. M. Coma, *R*	Los Angeles	Pomona
40–W. W. Bowers, *R*	S. Diego S. Bernardino, S Diego	

THE ASSEMBLY.

1–John McVay, *D*	Del Norte, Siskiu, Crescent City	
2–J. G. Murray, *R*	Humboldt	Eureka
3–G. Williams *R*	Humboldt	Ferndale
4–T. W H. Shannahan, *D*	Shasta, Trinity	Anderson
5–James J. K ayes, *D*	Modoc, Lassen	Bieber
6–H. K Turner, *R*	Plumas, Sierra	Sattley
7–A. P. Matthews *D*	Tehama	Tehama
8–C H Porter, *R*	Butte	Biggs
9–L. L. Burwell, *D*	Butte	Oroville
10–J C. Campbell, *R*	Colusa	Colusa
11–J. H. Seawell, *D*	Mendocino	Ukiah
12–C. M. Crawford *D*	Lake	Upper Lake
13–D. A. Ostrom, *D*	Sutter, Yuba	Wheatland
14–Joseph Sims, *R*	Nevada	Nevada City
15–J. I. Sykes, *R*	Nevada	Grass Valley
16–John Davis, *R*	Placer	Auburn
17–Henry Mahler, *D*	El Dorado	Coloma
18–W. M. Petrie, *R*	Sacramento	Sacramento
19–E. C. Hart, *R*	Sacramento	Sacramento
20–L. H. Fassett, *R*	Sacramento	Florin
21–L. B. Adams, *D*	Yolo	Woodland
22–F. L. Coombs, *R*	Napa	Napa
23–F. B. Mulgrew, *D*	Sonoma	Healdsburg
24–J. W. Ragsdale, *R*	Sonoma	Santa Rosa
25–Robert Howe, *D*	Sonoma	Sonoma
26–J. A Mullaney, *D*	Solano	Benicia
27–J. F. Brown, *R*	Solano	Bingham ton
28–J. W. Athe ton, *R*	Marin	Novato
29–Thomas Mulvey, *D*	San Francisco	320 Beale
30–J D. Long, *D*	San Francisco	16 Hubbard
31–T. J. Brannan *D*	San Fran.	International Hotel
32–John Staude, *D*	San Francisco	815 Pacific
33–W. E. Dinan, *D*	San Francisco	5 Jane Place
34–E. J Reynolds, *D*	San Francisco	1315 Jackson
35–H H. Dobbin, *D*	San Francisco	125 Silver
36–C. H. Kiernan, *D*	San Francisco	836 Mission
37–Thos. Scarry, *D*	San Francisco	432 Clementina
38–D. S. Regan, *D*	San Francisco	215 Seventh
39–John McCarthy, *D*	San Francisco, 329 Golden Gate	
40–E. Murray, *D*	San Francisco	10 Col Square
41–H C. Dibble, *R*	San Francisco	Nevada Block
42–E. S. Salomon, *R*	San Francisco, Stevenson B'dg	
43–L. L. Ewing *R*	San Fran.	Fourth & Townsend
44–H. M. Black, *D*	San Francisco	598 Mission
45–H. M Brickwedel, *R*	San Fran.	Fourth & Townsend
46–J mes Reavy, *D*	San Francisco	13½ Freelon
47–G. W. Burnett, *D*	San Francisco	616 Shotwell
48–P. C. Maher, *R*	S. Francisco, 637 Twenty-third	
49–L. J. Franks, *D*	San Mateo	Redwood City
50–James A. Hall, *D*	Santa Cruz	Watsonville
51–Joseph McKeown, *R*	Alameda	Alameda
52–Wm Simpson, *R*	Alameda	Alameda
53 M D Hyde, *R*	Alameda	Oakland
54–E. S. Culver, *R*	Alameda	Oakland

What Confidence Will Do.

The Nevada City *Herald* finds it necessary now and then to rap the knuckles of the croakers in that town, "who stay by hot stoves and walk the principal streets." It says: There are shirkers and workers in every community. There are birds of evil omen among the feathered race, and there are prophets of evil among men. The different impressions a stranger gets by conversing with citizens of a place is a pretty good criterion to judge of the citizen. The doubtful, faithless individual will convey the idea to others and probably give them the same impression he possesses. On the other hand, the hopeful man—the man who believes in moving things by personal effort—will convey his opinions and belief to all he comes in contact with. It is this kind of men that give life to a town. It is this kind of men that cause booms to take place in communities. Every prosperous place has a majority of such men. They are hopeful, confident and energetic. Their influence and example inspire others with the same feeling. The principle holds true in mining, as well as in other business. One hopeful man has raised Grass Valley from a comparatively dead mining camp to one of great prosperity. It will be conceded that when Mr. Bourne decided to take hold of the North Star and Empire mines, Grass Valley was not very prosperous. The mines themselves had been abandoned as worthless, but Mr. Bourne's faith induced him to invest his money, believing that with great depth he would be rewarded for his outlay. The facts proved that he was correct in his conclusions. His energy and hopefulness has borne fruit and the whole country around Grass Valley is now considered a good field for investment. Bourne's success has made every idle mine in Grass Valley district valuable. Men will now take hold of abandoned properties there who would not have looked at them before. The confidence of one man will inspire confidence in a dozen. Confidence makes a town, while want of it ruins one.

THE Oro Fino mine, El Dorado county, will soon start up its new 20-stamp mill. The mill cost $37,000, and is a very fine one.

Claims and Prospects.

There is a vast sight of difference between a mining "claim," a "prospect," and a "mine," and it would be money in the pockets of many a claim-owner in Homer district if they would learn this difference, get right down off their "high horse" and sell their numerous little piles of stone and pick scratches at from $20 to $1000 the claim, according to the prospect. The price of a farm bears some relation to the amount of improvement made upon it, and its other advantages in the way of location and other natural surroundings; but the most costly and splendid improvements will not make a farm of a lava bed, nor will a "claim" nor any amount of "blowing" make a mine, nor even a prospect, of side and end monuments and a paper notice of location.

A "prospect" is another thing, and is valuable according to the lithological and other conditions surrounding it—chiefly the trend, dip, strength and width of the ore body and the character and quality or grade of ore. But it requires labor and sometimes a great deal of it to show up a prospect—and even labor will not show it up unless it has first been prepared by nature's laboratory in the silent centuries of the past.

The Eastern people have adopted a very good test of the comparative or probable value of a prospect that is offered for sale. They will not look at nor listen to a person offering a mere claim or location; and they argue, and rightly, too, that if a man has a prospect that is worthy of their attention he has acquired it, not by discovery or accident, but by development, and their test of his faith in his own property is, did it justify him in making, at least, an attempt to develop it? If not, they will have nothing to do with it. And the Eastern people are right.—*Homer Mining Index.*

THE Plumas County Mining Committee asks the miners of that county to furnish it as soon as possible with detailed statements showing the amount of ground worked by them, the amount of water used and the length of their water season, together with any other information which might prove of value in the pending investigation of the debris question.

Rich Finds.

Wonderful stories are being told of a gold strike in Arizona. Thousands of dollars of free gold was found on the surface and tons of ore are reported which will run very high. As a result of these fascinating tales many are flocking to the scene of the strike, a few to be successful, but the great majority to fail in the attempt to gain sudden wealth. This, at least, has been the case in mining strikes without end. We can call to mind the excitement which existed when the Homestake was discovered at White Oaks, in the winter of '79 and '80, and the newspaper reports which brought an army of men into the country. Old Jack Winters was bringing out boulders filled through and through with yellow, wire gold, from a 10-foot hole on the hillside, and as specimens went East, adventurous men flocked in until the mountains were teeming with them. Then Jack "cleaned out" his pocket and the army took the back trail. A few, however, stayed; many more came in the course of years, and White Oaks is now a noted mining camp of the world. Then there was our own rich gold strike in the Organ mountains. The glowing descriptions of Pat Breen's "find," made six years ago, which at the time occupied columns of the *Republican*, read like fairy tales. A single shot left the bottom of a shallow hole yellow with the precious metal; large pieces of pure gold, not interlaced in the rock as at White Oaks, but in nuggets, were brought by swift messengers to Las Cruces to announce the find. Pat sold half of his mine for $12 000. After a time when gold couldn't be picked from the dump by every visitor, the excitement died out. Breen's mine is yet to be thoroughly developed, and, like at White Oaks, ore of probably lower grade but better bodies will be found with depth.—*Rio Grande Republican.*

THE Santa Fe *New Mexican* says: Santa Fe county leads in exporting the treasures of the earth. At present Santa Fe county is shipping out hard and soft coal, coke, charcoal, iron, turquoise, silver, lead, copper, zinc, stone, lumber and gold. Shipments of the latter have been going on continuously for more than 100 years.

AN EXTINCT VOLCANO.—At a point in Mexico, about 100 miles north of El Paso, there is a lake of molten, black volcanic glass, which seems to have been agitated at the moment of cooling into ragged waves of fantastic shapes. These lava waves or ridges are from 10 to 12 feet high, with combing crests. This lava flow is about 40 miles long from northeast to southwest, and from 1 to 10 miles wide. For miles on all sides the country is the most desolate that can be imagined. It has been literally burnt up. It consists of fine white ashes to any depth which, so far, has been dug down.

BUTTE COUNTY ORES.—At the recent Citrus Fair at Oroville a small mineral exhibit was also made. The gold quartz from the Golden Buzzard mine, near Inskip, Butte Co., exhibited by S. M. Morgan, was exceptionally rich. A representative of the MINING AND SCIENTIFIC PRESS learned from Mr. Morgan that he is running a tunnel which will strike the ledge 75 feet from the surface. There are two tunnels that reach the vein, and the richest specimens were obtained in the lower one. The vein is decomposed quartz and the gold is so coarse and free that it can be separated from the rock by hand with any sharp instrument. McMillan Bros. & Hurlton had on exhibition 20 specimens of gold and gold quartz from the Hurlton mine, 14 miles east of Oroville, that were much admired, and pronounced by experts as fine as any ever seen in Oroville.

THE "GRIZZLY GIANT" OF MARIPOSA GROVE.

MISS FLORENCE A. DENSMORE, late principal of the New York Woman's Institute of Technical Design, is now in this city, with the view of establishing a similar institution here. Her own work will be to form a normal class for the purpose of training young women to act as teachers in such an institute. They will be taught the best methods of instructing pupils in industrial drawing, modeling, designing, and the mechanical arts.

IN the Agra district, between Shingle Springs and Placerville, El Dorado Co., mining matters are very active.

CHIEF ARTHUR of the Brotherhood of Locomotive Engineers is on a visit to this city.

Passing Events.

The Harqua-Halla mining excitement in Arizona has received a little "set-back," by reports of people who had visited the district and do not believe it is as rich as represented. The views of an observer are given in another column.

The Los Burros gold mines in Monterey county are again attracting some attention. Many people did not believe any gold mines of importance would ever be found in the Coast Range, but some of the claims at Los Burros show very well for the work done.

All the smelting furnaces at Eureka, Nevada, have been closed down in consequence of the suits commenced by the Government against the miners for cutting the "scrub pines" for fuel.

The gold ledges at Texada island, B. C., are causing some local excitement, and when spring opens the claims will be systematically developed.

To-day is the anniversary of the discovery of gold in California. A statue to Marshall, the discoverer, has been completed and is being placed in position at Coloma, near the spot where the first nugget was found.

The Sutro tunnel was sold this week under a decree of foreclosure, and the miners on the Comstock hope for some improvement in terms under a new management.

Gold in California and Australia.

Speaking of the monument now being erected to the memory of James W. Marshall, certain of our cotemporaries severely criticise the manner in which the gold-finder when alive was treated by the State of California, contrasting such treatment with that extended by the English Government to Hargraves, the discoverer of gold in Australia. While it must be admitted that our treatment of Marshall was decidedly shabby, it can hardly be claimed for him that his merits as a discoverer equaled those of the Australian. The Marshall gold find was the result of sheer accident; that of Hargraves of intelligent observation followed by diligent and successful search. All the merit that can be claimed for Marshall in this connection is that he did not, when he first noticed these little pieces of strange-looking metal, pass them by, giving them no further heed, as many men under like circumstances would have done, thereby postponing very likely the grand discovery of gold in California for many a day, and consequently that in Australia as well. Gold had been found and placers worked in a small way at different places in California long before the find at Sutter's mill occurred. But of this Marshall was ignorant, wherefore he must be credited with whatever of thoughtfulness his action on that occasion implies.

With his Australian compeer it was quite different. He had resided in New South Wales many years prior to the gold find there. The country was reputed to be auriferous, samples of gold bearing quartz having been obtained at several places and even quite a large nugget picked up by a shepherd named Macgregor somewhere in the Wellington district. As early as 1844 Sir Roderick Murchison, the distinguished English mineralogist, while traveling in Australia, observing the auriferous indications, had expressed the opinion that valuable gold-fields would some day be found in that region.

Incited by the reported gold discoveries in California, Edward Hammond Hargraves, an English settler and sheep-raiser in New South Wales, left that country in the month of July, 1849, for San Francisco, where he arrived in October of that year. Proceeding to the mines, he spent the winter working in the placers about Jamestown, Tuolumne county.

The following spring he returned to San Francisco, and while there wrote, under date of March 5, 1850, to a friend of his, a merchant in Sydney, expressing the opinion that there existed a gold region within 300 miles of that city, this opinion being based on the resemblance which that country bore to California. So firmly was Hargraves convinced of this, that he would, as he tells us, have at once set out on his return to Sydney, with a view to exploring the region mentioned, only that his funds being low, he did not care to go home empty-handed.

After tarrying in San Francisco several months, he returned to the "diggings," going this time to the northern mines, where his luck improved. First he went to Foster's Bar, on the Yuba, but being unable to secure a claim there, proceeded eight miles further on to what he calls "the Slate Ranges," where he remained till the first of November, his earnings meantime having averaged about 1½ ounces per day.

Being now in funds and having fully resolved to go back to Australia and prospect for gold, he came down to San Francisco, and a few days afterward set sail for Sydney, New South Wales, which place he reached early in January, 1851. On arriving there he explained to his friends the cause of his early return, stating his fixed purpose to set out at once on a prospecting expedition, all of which they treated with derision.

The locality he desired first to visit, and one he had been in 18 years before, was on the Lewes Pond creek, near Guyong, about 300 miles in the interior. Setting out on the 5th of February, he reached that place in good time, finding to his great gratification that his recollections of it had not deceived him. There was the red earth, the siliceous gravel, the quartz veins and other geological features all so like what he had seen in California. He felt that he was in a gold-bearing region, a fact that he was not long in demonstrating. Taking a pick, a trowel and a pan, he proceeded to scratch away the top earth from a schistose dyke that ran across the creek, after which he filled his pan with gravel, and washing it in a water-hole near by found in the bottom a small piece of gold. Following up this trial with several others, nearly all gave a like result, and thus was the long-suspected existence of placer deposits in Australia first established by a practical test, this having occurred on the 12th day of February, 1851. Hargraves made a note of the event, which was afterward given into the keeping of the Colonial Secretary to be preserved as evidence of the day on which it happened.

Before going back to Sydney, Hargraves, desiring to ascertain something as to the probable extent of the placers, visited the Macquarie river, Mitchell's creek and other localities, distant 60 to 75 miles from Guyong, at all of which he found gravel that prospected well in gold. He also dispatched two men to the Wellington district, 100 miles away, who reported the existence of a promising gold-field in that direction.

This accomplished, the successful prospector hastened back to Sydney, and putting himself in communication with the Colonial Secretary, acquainted him with the nature of his discoveries, offering to disclose their localities on condition that the public authorities would award him, in the first instance, the sum of £500, leaving it to the Government to give him such additional compensation as the importance of the discoveries might seem to warrant. To this offer the Secretary made answer that any remuneration for the discovery of gold on Crown lands must depend on its value, the amount to be fixed by the Government after such value had been ascertained.

Acting on this suggestion, Hargraves imparted to the authorities full information on the subject, all of which being made public, an intense excitement, followed by a great rush for the mines, at once ensued. Having been begun, one gold-field after another was discovered, and there being already many inhabitants in the country, the mines became rapidly populated, the output of Australian gold for several years thereafter nearly rivaling that of California. At its next session, the Legislative Council of New South Wales awarded the gold-finder the sum of £10,000, deducting by way of discount the £500 he had already received. The amount, though not large, was princely compared with the paltry monthly stipend Marshall received from the State of California, and which, having been grudgingly paid for a short time, was afterward withheld altogether. While Marshall was not, as a discoverer, entitled to the same consideration as Hargraves, he still merited something at the hands of this rich commonwealth which, having once voted him a pittance, might very properly have continued the same, inasmuch as the recipient, before this gold find, had already rendered the State some service.

MR. J. B. HAGGIN has been interviewed concerning the report that the copper syndicate would make another contract concerning the product of the Anaconda mine. He was not at all communicative relative to the status of negotiations between himself and the syndicate, but did not deny that negotiations are under way looking to a renewal of the contract.

THE crank shaft of the Chollar hoisting engine broke on Tuesday, and one cylinder head blew out while the cage was being brought to the surface. The cage was stopped by brakes and no further damage resulted.

A STRIKE has been made in the Wildgoose mine in Jumbo district, Nevada. A sample of ore assayed $339.25 to the ton, mostly gold. A development has been made 160 feet below the surface.

GAS COAL.—The S. F. Gaslight Co. paid an average price for coal in 1888 of $7.63 per ton. The average price paid in commercial circles was $10.50. The company laid about 20 miles of new mains last year.

ASSAY COMMISSION. — The President has named the Assay Commission to test the coinage for the present calendar year. The California member of the commission is A. J. Bowie of San Francisco.

THE U. S. Geological Survey asks for $350,000 to make surveys and locate reservoirs for water storage to irrigate arid portions of the West.

The State Mineralogist's Report.

We received this week from the California State Mining Bureau the Eighth Annual Report of the State Mineralogist, Wm. Irelan, Jr. There are upward of 900 pages in the volume and numerous illustrations of mines and mining appliances. By the Act approved March 9, 1887, providing for the support of the bureau for the 39th and 40th fiscal years, the sum of $60,000 was appropriated, and the Act provided that at least 50 per cent of this appropriation should be used for geological field-work. In accordance with this, as many assistants have been employed in the field as the appropriation would allow, and it is mainly the results of their work that form this volume.

While we have only been able to glance at the headings of the chapters and the general features of the report, the casual examination leads to the opinion that it is of more practical value to our mining community than any which have preceded it. Less attention is paid to minerals and more to mining, as should be the case, since the museum itself gives all the necessary ocular information concerning the minerals and a mere catalogue is of little general interest.

To each county of the State a special chapter is devoted, giving an account of its mineral resources and its mines, mills, etc. There are also special articles as follows: "On Milling of Gold Ores in California," by John Hays Hammond; "Notes on Hydrometallurgy of Gold and Silver," by C. H. Aaron; "Lithology of Wall Rocks," by Melville Attwood; "Building Stones," by A. Wendell Jackson; "Drift Mining in California," by Russell L. Dunn; "Notes on Western Lead Smelting," by W. S. Keyes; "Water-Wheels," by F. F. Thomas.

In addition, there are chapters on the Russell Process, U. S. Patents in California, Water Rights, Mineral Resources of the State, and Natural and Artificial Cement. There is also a tabular statement of the quartz-mills in the State and of water-wheels used in different counties, all of which, with the reports of the State Mineralogist and the trustees of the bureau, form the report as a whole.

Probably the most important chapter in the book is that by Mr. Hammond on "Milling of Gold Ores in California," a subject the bureau should have long since thoroughly worked up, and which the editors of the PRESS have been urging upon the officials for some years. Even now there remains much available information to be collected, and it can only be gathered by systematic work in the field and personal investigation of all the mills of the State. A great deal appears to have been collected as to milling practices by the mineralogist's assistants the past season, and this is shown in the tabular statement of mills by counties, giving name, power, number, weight, and drop of stamps, tons crushed, and number and kind of screens, but the mineralogist has not drawn any generalizations or conclusions from the data thus compiled.

In the county chapters, each of the prominent mines is described and the developments noted, and the information seems to be so full that there can scarcely be complaint that any locality has been neglected. The information ought to be, and probably is, very correct, as it has been gained, not from letters or hearsay, but by personal examination, and will be valuable to any one interested in mining matters.

Altogether, the report is a satisfactory one, and is really a new departure in such matters. It shows conclusively that the legislative proviso that certain money should be spent in field work was a wise measure, since it has been the means of collecting information and data hitherto unavailable, except in scattered newspapers and other publications. The official report may be obtained by any miner or other citizen applying for it, and no charge is made, the State paying for the work. Although the principal mining done in California is for gold, this is the first one of the many reports published by State officials that ever gave that branch of the subject any special attention. This time the gold mines and mills are given the prominence due them, the bulk of the report being devoted to their consideration. The State Mineralogist and the trustees of the bureau can congratulate themselves in having brought together much practical information, and they ought, after this, to have no trouble in getting appropriations to continue the work so well begun.

The Discoverer of Gold.

To day, January 19th, is the anniversary of the discovery of gold in California, Marshall having picked up the nugget in the tail-race of the Sutter mill, January 19, 1848. The event was one which brought California prominently before the attention of the people of the whole world, and ultimately led to the settlement of the Pacific Coast by citizens of the United States. Thousands of people flocked into California in a few months, and a State was built up in a wonderfully short period, scarcely paralleled in the history of the world.

The people of this State have erected a statue to the memory of James Wilson Marshall, the discoverer of gold in California, and it will shortly be dedicated with appropriate ceremonies. We give on this page a cut showing the figure of Marshall, as it stands on the pedestal. The whole statue stands 40 feet in hight, the base being decorated with suitable tablets. It was designed and made by F. Marion Wells, under the direction of a Board of Commissioners appointed by the State. We publish this as a rough sketch only, intending to give a photo-facsimile as soon as the statue as a whole is ready to be photographed.

There has lately been made an attempt to change the date of the discovery from the 19th to the 24th day of January, such proposed change being based on an entry made in a diary kept by Henry H. Bigler, one of the hands employed under Marshall, and who was at work on or about the mill when the gold find occurred. As we have already in these columns given our reasons for rejecting the Bigler version of this matter, we need not here further discuss the subject.

This statue occupies the summit of a gentle eminence a short distance west of Coloma, the site of the Sutter sawmill, in the race of which the first piece of gold was found. Overlooking the famous mill-race and the early home of Marshall, the locality has been well chosen, it being here also that the mortal remains of the "gold-finder" repose.

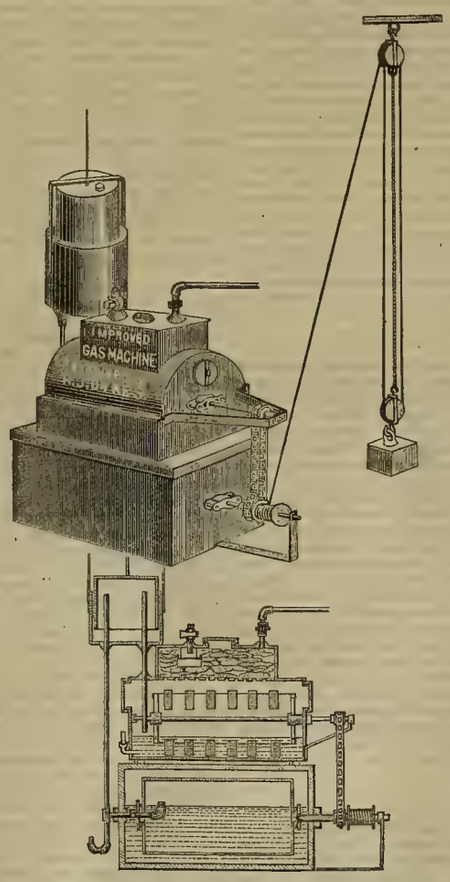
THE FIGURE ON THE MARSHALL STATUE.

An Improved Carburetor.

Hugh J. Dykes of Berkeley has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved carburetor or automatic gas machine. The patent covers one of that class of carburetors in which air is forced into contact with volatile liquid hydrocarbons or oils, whereby it becomes saturated with inflammable vapor and may be conducted through pipes to burners. The invention consists in a rotary frame mounted within a casing containing the liquid hydrocarbon or oil, said frame carrying an absorbent material —such as strips of lampwick—which by the rotations of the frame are necessarily immersed in the body of oil and withdrawn saturated to give forth to the air in said chamber their inflammable vapors. It also consists, in combination with the cylindrical oil-casing or reservoir in which the air is carbureted, of a superposed feed-casing communicating along the center of its base with the oil-casing, and having the edges of its sides depressed to form receptacles for the oil.

The engravings on this page show a general view and section of the machine. By connecting the cylinder of the air-pump with the wick-carrying frame of the carbureting chamber their operation is made independent, whereby, when the capacity of the pump is increased, the operation of the wick-frame is also increased and the increased volume of air is provided for. The aerometer regulates the supply of air and when weighted requires an increase on the weight power for operating the pump cylinder.

The whole machine, it will be observed, is compact in construction and is available for operation in any situation. The depressions in the feed-casing hold enough oil to keep the absorbent material thoroughly saturated. The motion of the cylinder of the air-pump communicates rotation through the endless chain and sprocket pulleys to the frame in the shell, so that the wicks of the frame are brought around successively and immersed in the oil held in the shell, and as these wicks rise from the oil thoroughly saturated therewith they present an extended surface capable of giving off rapid evaporation, and thus give to the air their inflammable vapors, by which this air, rising from contact with the oil body partially carbureted, is completely carbureted, and passing up through the aperture and through the absorbent material in the casing, is relieved of any excess of hydrocarbon vapor, and finally is discharged through the pipe into the burner connection. These machines are in use in several places in this city, as well as in Berkeley, Woodland, Los Angeles, and in Tombstone, A. T. They are manufactured in San Francisco by the inventor. The well-known Cliff House uses these appliances for both lighting and cooking.



DYKE'S AUTOMATIC GAS MACHINE.

The Legislature.

Now that the Legislature has made all the usual appointments, the introduction of bills has commenced.

Assemblyman Sims of Nevada county has presented a bill appropriating $150,000 for the maintenance of the State Mining Bureau.

Among other bills is one by Simpson providing that the rate of wages on public work to cost over $10,000 should be fixed on the basis of the Labor Bureau's statistics of prevailing labor laws.

In the bills introduced in the Assembly the State Prison jute interests are well provided for. In all $502,500 is appropriated for additional machinery and buildings at San Quentin and Folsom, and in addition the revolving fund for the purchase of jute is increased to $100,000.

Among the Senate bills introduced is a bill by Britt, providing that the stationary engineers of San Francisco shall advise the Governor to appoint three examining engineers and a secretary, who shall appoint other examining engineers in every county of the State. The secretary is to get $4 a day and engineers $5. This Board of Examining Engineers is to license engineers of portable and stationary steam engines and boilers.

There is also a bill by McGowan making it a misdemeanor to empty sawdust or explode giant powder in any of the waters of the State.

Camminetti has a bill establishing an industrial training school for youths in every city and county, and providing an appropriation therefor.

Labor Commissioner Tobin has succeeded in obtaining the favor of the Assembly Committee on Labor and Capital for the bill compelling employers to keep properly ventilated workshops, and to provide seats for saleswomen who now stand all day. Also for the bill prohibiting the employment of children of tender years in factories.

Assemblyman McCarthy introduced a bill which provides that municipal governments shall have the power to establish and operate water works.

The Senate Committee on Mines, Drainage and Mining Debris are: Meade (Chairman), Preston, Greely, Langford, Dray, Murphy, Roth and Brice land.

The Assembly Committee on Mines and Mining Interests are: Mahler, Tulloch, LaGrave, Reavis, Gardner, Davis and Coleman.

There is an Assembly Committee also on Agriculture, Mining and Mechanical Arts as follows: Tulloch, Burwell, Reavis, Frank, Atherson, Hersey and Williams.

A Proposed State Debris Commission.

As is well known, a Government Commission is now at work on the debris question, and it is now proposed to have a State Commission also. We are informed that a bill will be introduced during the present session of the Legislature, of which the following is the text:

An Act to create a commission to examine and investigate the conflict between the mining and farming interests and to report thereon.

The people of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. The Governor of the State of California is hereby authorized and directed to appoint a commission for the purpose of making a thorough examination and investigation of the mining-debris question in the State of California for the purpose of ascertaining whether some plan can be devised whereby the present conflict between the mining and farming interests can be adjusted and the mining industry rehabilitated, and for the complete examination of the non-navigable watercourses of the State, affected by debris, with a view of determining what, if anything, can be done to protect such streams and the arable lands adjacent thereto from injury from mining debris without interfering with the business of mining.

SEC. 2. That commission shall consist of five members, two of whom shall be representative farmers, two shall be representative miners, and the fifth member shall be a competent civil engineer.

SEC. 3. Said commission shall, upon the completion of its work and before the first day of November, 1890, make a full report of its examination and investigation, and of the results thereof and its conclusions thereon to the Governor of the State of California, and shall, as part of such report, make such recommendations upon the subject of such examination and investigation as said commission shall deem proper.

SEC. 4. Said commission shall have power to appoint a secretary who shall receive a salary of one hundred and fifty dollars per month during the time that such commission desires his services. The engineer appointed upon such commission, as above provided, shall receive a salary of three hundred dollars per month. The salaries of the secretary and of said engineer, together with the actual expenses of the commission, shall be paid by the State out of the General Fund.

SEC. 5. This Act shall take effect from and after the day of its passage.

SCIENTIFIC PROGRESS.

Remarkable Volcanic Eruptions.

Next to the great Krakatoa eruption, which occurred in August, 1883, to which reference was made in these columns last week, the eruption which destroyed the peak of Sho-Bandai-san, Japan, on July 15th last, will rank as the most gigantic and most disastrous upheaval of modern times. Partial accounts of the eruption have already been published, but they all fail to give that explanation of the phenomenon which patient and scientific investigation on the scene of the disaster alone could afford. That explanation has now been furnished, and is contained in the report of two highly trained Japanese specialists of the Imperial University of Tokio. The two scientists have embodied the results of their investigations in their report, which is given in the form of a paper read before the Seismological Society of Japan on October 11th. As they carried on their investigations under highly favorable circumstances, their paper is full of interest for the student of natural science.

The peak that was destroyed on July 15th is, or was, one of a group of four conical mountains, forming the walls of an old elevated crater basin, and rising to a hight of some 6000 feet above the sea. Stratified volcanic rocks, the fruits of many successive eruptions, apparently of prehistoric date, are found on the slopes. But, though Japanese records often speak of fire and smoke and poisonous vapors issuing from Bandai-san, the latest known active eruption took place 1081 years ago, and all that remained to warrant the mountain's retention in the list of live volcanoes were a few solfatara in and near the old crater, which from time immemorial has given off steam. On the morning of July 15th this condition of tranquillity was suddenly and violently disturbed, first by a mild preliminary earthquake, followed very soon by a second and prolonged shock of fearful violence. A dense volume of dust rose to the hight of about 4000 feet, accompanied by a succession of 15 or 20 violent explosions, attended by sharp flashes of lightning and a final ejectment of molten lava, preceded by an immense volume of steam and bluish-gray dust (volcanic ash), reduced to a fine powder by the violent mechanical disintegration of the rocks ejected.

This fine dust rose to an altitude of about 15,000 feet and spread out fan-shaped to the leeward, covering upward of 1000 square miles of land and reaching the seashore 62 miles distant. Near the volcano this dust covered the land about six inches deep, while at the sea coast it presented a mere film of dust. The noise of the explosion was distinctly heard 30 miles to the windward and 60 to the leeward. Fully 27 square miles of territory were covered by huge rocks and heavy masses of solid matter to an average depth of many fathoms. All of this prodigious amount of matter was ejected within the very short period of about ten minutes. It should be stated that a considerable amount of this ejected matter consisted of the peak itself, which was tossed in gigantic masses high in the air to fall upon the adjacent slopes and plain.

Steam, the well-known chief agent of most earthquake phenomena, was very apparent on this occasion. The great volumes of steam that must be generated whenever, from any cause, subterranean waters are brought into contact with the molten interior, expand and fill up the rock fissures. If not deep enough down, or if lacking sufficient pressure and volume to break through the superincumbent masses, such ebullitions, though they may wrench and strain and tear the earth's crust internally, are yet hopelessly imprisoned and can only produce on the surface the phenomena of earthquakes or minor seismic vibrations. But there are cases—happily none too common in this our day—when the pent-up vapor succeeds in bursting open its prison roof along some line of least resistance and working havoc on a prodigious scale.

A Remarkable Volcano in San Salvador.

The city of San Salvador in Central America is surrounded by a group of volcanoes, two of which are active, and present a magnificent display to the passengers of steamers sailing along the coast, constantly discharging masses of lava, which flows down their sides in blazing torrents. One of them, Izalco, is as regular as a clock in its eruptions, like the beating of a mighty pulse, every seven minutes. It is impossible to conceive of a grander spectacle than this monster, rising 7000 feet almost directly from the sea, and vomiting forth alternate masses of smoke and flame 1000 feet above the summit alternately every 11 minutes. It is called the lighthouse of Salvador and is in many respects the most remarkable volcano in the world, because its discharges have continued so long and with such regularity, and because the tumult in the earth's bowels is always to be heard. Its explosions are constant, and are audible a hundred miles off. It is the only volcano that has originated on this continent since the discovery by Columbus. It rose from the plain in the spring of 1770, in the center of what had been for nearly a hundred years a magnificent coffee and indigo plantation.

Another Mexican Volcano.

Mount Pelado in the Mexican State of Tabasco has become an active volcano, emitting crimson-dyed water, which has colored Grijaldo river for many miles. People living in the neighborhood of the mountain are in a state of panic, and predict that the mountain will cover the entire district with lava. Tabasco is on the Gulf of Mexico.

The World's Largest Flower.

A Rival in Blossom and Petal to the Victoria Regia.

In the furthest southeastern island of the Phillipine group, upon one of its mountains, Parag, in the neighborhood of the highest peak in the island, the volcano, Apo, a party of botanical and ethnographical explorers recently found at the hight of 2500 feet above the sea level a colossal flower. The discoverer, Dr. Alexander Schadenberg, could scarcely believe his eyes when he saw amid the low-growing bushes the immense buds of this flower, like gigantic brown cabbage-heads. But he was still more astonished when he found a specimen in full bloom, a five-petaled flower nearly a yard in diameter—as large as a carriage wheel, in fact. This enormous blossom was borne on a sort of vine creeping on the ground. It was known by the native who accompanied Dr. Schadenberg, who called it Bo-o. The party had no scale by which the weight of the flower could be ascertained, but they improvised a swinging scale, using their boxes and specimens as weights. Weighing these when opportunity served, it was found that a single flower weighed over 22 pounds. It was impossible to transport the fresh flower, so the travelers photographed it and dried a number of the leaves by the heat of a fire. Dr. Schadenberg then sent the photograph and dried specimens to the Royal Botanical Gardens at Breslau, where the learned director immediately recognized it as a species of Rafflesia, a plant formerly discovered in Sumatra, and named after the English Governor, Sir Stamford Raffles. The new flower was accordingly named Rafflesia Schadenbergia. The five petals of this immense flower are oval and creamy white, and grow around a center filled with countless long violet-hued stamens, thicker and longer in the female or fertile flowers than in the infertile. The fertilization is accomplished by insects whose larvæ breed in the decaying flesh of its thick petals. The fertile flower develops a soft, berry-like fruit, in which countless seeds are imbedded. The flower exhales a poisonous gas, even when first opened.

THE AGE OF TREES.—Where the zone test can be applied, we know that the age imputed to the tree will not err in the way of excess. A clearly marked ring infallibly denotes a season's growth. Assuming an unfavorable season to have resulted in an unusually thin or perhaps an indistinguishable layer, one year's credit will remain unentered in the tree's automatic ledger. On this basis of computation the following ages have been strictly verified in Germany: In that country, as in Finland and Sweden, the pine and fir have attained to from 500 to 700 years. The greatest ascertained age of the larch (in Bavaria) is 274 years, while the silver fir has reached 248. The oldest known specimen of the holm oak (near Aschaffenburg) numbered 410 years; while in all the common oaks about 320 years old the heart was beginning to decay. The maximum ages of other German trees — as found by counting the rings—are as follows: Red beech, 245; ash, 170; elm, 136; birch, 200; aspen, 210; and alder, 145 years. The lime, beloved of the Fatherland, generally evades this test. Probably one of the longest standing of all, it is seldom found in a sound condition at an advanced age.

MOUNTAINS OF IRON are becoming quite common in various parts of the world. The latest discovery of this kind has recently been found in Burmah. Dr. Noetling of the Geological Survey of India, in a recent report on magnetic rock among the Shan Hills of Upper Burmah, describes a mountain or hill at Singaung which "consists of a huge mass of iron ore." Having, he says, noticed on the way numerous pieces of iron ore, which became still more frequent on the southern side of the hill, he examined the latter in several directions. He found the surface everywhere covered with large blocks of iron ore, originating evidently from superficial decomposition of lower beds. He concluded that the whole hill consisted of a large mass of iron ore. He was unable to ascertain the geological conditions under which this ore occurs, or its exact limits and extensions, on account of the dense jungle and the tremendous attraction, rendering his compass useless. He estimates, however, that the hill covers, at least, an area of about a square mile, and that it rises about 200 feet above the level of the Twinnge valley. The ore is hematite peroxide of iron.

A NEW MINERAL COMPOUND.—Dr. Grudman of Hirschberg, Germany, has patented a new process of making magnesia into a carbonate by exposing it to carbonic acid as produced by burning coke in close apartments. It thus forms a substance as hard as magnesia, and capable of taking a fine polish. Mixed with marble-dust it forms an artificial dolemite; with soluble silicates an artificial stucco.

A LARGE METEORITE.—It is said that a newly fallen meteoric stone, weighing 140 pounds, has been found at Elsworth, Wis.

MECHANICAL PROGRESS.

SELECTING IRON FOR BOILERS.—When the heat rays, from any source of heat, strike a body, one of three things may happen: either they penetrate into the mass and are absorbed, or they pass through it, or they are stopped at the surface without penetrating, and are either reflected back in the direction whence they came, or by making the angle of coincidence equal to the angle of reflection, pass off in an oblique direction. Polished surfaces and those with a clean color are usually the ones that reflect heat with the least amount of absorption. Of these, mercury stands in the front rank, and brass comes next. Tin, steel and lead are the reflectors that have only three-quarters the efficiency of brass. White reflects; dark and dull colors absorb heat, as do also wood and earthy substances. But they may be made into reflectors by covering them with a glaze-like crockery. These properties, whether radiating, conducting, absorbing or reflecting, have important practical applications; they show, for instance, that, in the manufacture of boilers, a metal with high conductive properties should be preferred to one possessing it to a lesser degree; that the thickness of the sheet should not be excessive; that the polish of the exterior surface should be very slight; that if it is desired to prevent the heat from radiating from the surface of the boiler or steam cylinder, they should be covered with some poor conductor like wood, charcoal, earthy matter, felt, etc., and then by some high reflector like polished iron, copper or brass. It is by the application of these same principles that in summer we wear light-colored clothing to reflect the heat of the sun, and in winter, thick, dark-colored clothing to retain the heat of the body.

RADIATION FROM STEAM PIPES.—Experiments have recently been made of the comparative efficiency of cast-iron and wrought-iron pipes in giving out heat when arranged as radiators for heating rooms. The tests were made by Mr. William Anderson, C. E., England, with cast and wrought iron surfaces in pipes of different diameters and different thicknesses, as the pipes were ordinary four-inch cast-iron and two-inch wrought-iron pipes. The result of one experiment showed 232 units of heat per square foot per hour for cast-iron pipe and 356 for wrought-iron pipe—a difference of 124 units, or upward of 50 per cent in favor of wrought iron. Another experiment gave 147 for cast iron and 255 for wrought iron, a difference of 78 units. Cast-iron pipe of about twice the thickness gave out 53 per cent less units of heat, from which it can be seen that the thickness of metal in radiators is of great importance, and that if the cast-iron pipe had been the same as the wrought-iron, which thickness is attained in numerous cast-iron radiators, a much different result might have been the consequence. The emissive powers of surfaces do not increase in the same proportion directly as the difference of temperature, as it may be observed that the power of emission varies from 9 to 10 per cent at the given temperatures. Mr. Anderson states, "the rate of emission for differences of temperature of 200° and 100° differed by as much as 22 per cent. At 200° there was 22 per cent more heat given out per square foot per difference of degrees per hour than at 100°." Practically, the difference between wrought and cast iron of the same thickness is not of much importance.

THE MANUFACTURE OF SCREWS.—It is not known when screws were first made and brought into use. The first instance known of machinery being applied to the making of screws was in France, in 1569, by a man named Besson, who contrived a screw-cutting gauge to be used in a lathe. The early method had been to make the heads by pressing the blanks while red-hot between dies, and then to form the threads by the process of filing. In 1741, Besson's device was improved by Hindley, a watchmaker of York; and for a long time the watchmakers of England employed the latter's method in making the small screws used in their work. The first English patent appears to have been issued to Job and Wm. Wyatt, in 1760, for three machines—one for making blanks, another for nicking the heads, and a third for cutting the threads. Between that date and 1840, about 10 patents were issued, only one of which is worthy of notice, namely, that of Miles Berry, dated Jan. 28, 1837, which was for a gimlet-pointed screw.

CEMENT FOR BELTS.—A writer who has had much experience in the use of belts, says that whenever he puts on a new belt he generally runs it with lacing, and runs it for a few days to get the stretch out. Then some Saturday afternoon, when the machinery is stopped, he cuts his belt and skives it down so as to have about six inches lap of the same thickness; then he puts on a thin coat of Le Page's prepared carriage glue, and puts in two lacings lengthways, presses with heavy weights, and lets it stand till Monday. He is using a three-inch belt; before using this cement he was troubled a good deal with belts breaking. If there is anything better he would like to hear from it.

REMOVABLE FIRE-TUBE.—A Russian engineer has arranged the fire-tube of a horizontal boiler in such a manner that it may be removed in its entirety without any disturbance of the boiler end. The fire-tube is of conical shape, and it has an approximately elliptical cross-section. Flanges are formed upon the ends, by means of which it is secured to the body of the boiler, the back flange on the smaller end of the fire-tube, abutting against the rear end of the boiler, and the larger end abutting on the outside of the front end. The opening in the front of the boiler for the admission of the fire-tube is of sufficient size to allow of the insertion of the back flange, and after the bolts have been unfastened, the fire-tube may be withdrawn without disturbing the body of the boiler itself. The fire-tube is provided with vertical cylindrical tubes of small diameter, and by the oval cross-section of the fire-tube a greater number of these cross-tubes may be inserted than has been hitherto possible, and the heating surface increased in consequence.

FIGHTING SHIPS WITH BURNING PETROLEUM. *English Iron* says: According to American contemporaries, a large company, backed by the usual millions of dollars, has proposed to the U. S. Secretary of the Navy "a striking and possibly effective scheme for the defense of Philadelphia harbor, and the harbors of other cities, from the attacks of an enemy's fleet by shooting ignited petroleum at the unfriendly ships from the bottom of the river and burning them up." The originators of the petroleum-defense scheme have induced the American Government to give directions for a preliminary examination of Philadelphia harbor, and a company has been organized to develop the plan and show its practicability. It is proposed to sink perforated iron pipes in the river-bed and the approaches to the harbor, through which petroleum can be forced to the surface of the river by machinery and at a high pressure. In this way a fierce stream of blazing oil can be sent down on the enemy's fleet to destroy it or drive it away. It is claimed by the projectors that a flame can be produced in this way as high as a ship's mast, and sent with terrific force on the attacking vessels many miles from the point where the oil is supplied to the system of submerged pipes, and even iron vessels could not pass through this lake of fire, because it could be made to extend many miles along the river. An experiment in connection with the scheme is to be made at Fort Mifflin shortly, and great things are expected from the pending experiment.

BULL'S METAL—A NEW ALLOY.—It is stated that a new malleable alloy of the bronze kind has been produced by Mr. John Bull of London, by a process for which it is claimed that it secures the introduction and admixture of the component metals in accurately controllable and definite proportions, forming true alloys of high strength and uniformity. Some of the specimens of cast, rolled and turned rods show remarkable uniformity in extension throughout the whole length of the test part, and not so marked a contraction in one spot only as is usual. In one of the test specimens the elastic limit was reached at 24 tons per square inch, above which the metal suddenly extended about two per cent; it then dropped a little in tensile resistance and recovered, as in the case of mild steel, further extension being very slight up to 30.6 tons. After this the extension was uniform up to the point of rupture at 34 76 tons per square inch.

TO PREVENT CAST IRON FROM RUSTING.—The following manner of preventing cast iron from rusting will be found very effective: The castings should be carefully cleaned and then washed in dilute acid. When they are thoroughly dry, the surface should be rubbed with a file or metallic brush. Next, give the casting several coats of raw petroleum, being careful to let each application become dry before applying another. After the last application has become dry, rub with a hairbrush. This will produce a polish that will stand a high degree of heat and keep the piece from rusting.

CASTING IRON COLUMNS.—A correspondent of the *American Machinist* says: "There are some practices common to most foundries which cannot be too severely criticised. Columns are often made with heavy moldings, and bases cast on them, to save trouble and time. This should not be done, as it endangers the safety of the casting; for not unfrequently castings thus made are found to have separated at places where abrupt changes have occurred in the outline."

THE ELECTRO-MAGNET IN A MACHINE SHOP.—An electro magnet with a carrying capacity of 800 pounds is attached to a crane in the Cleveland, O., steel works, and readily picks up and handles billets and other masses of iron without the use of chains, tongs, or other devices. A mere lad is thus enabled to do the work of 14 or 15 men.

CAST STEEL FOR HEAVY SHIP MACHINERY.—There appears to be a strong current of opinion setting in against the use of cast steel in the larger details of ships and ship machinery. The tendency to develop flaws in large castings and the consequent loss and delay entailed may be ascribed as the great objection.

TEMPERING DRILLS.—It is stated that a workman in the Carson, Nevada, mint has made the discovery that drill points may be so tempered electrically that they will penetrate the hardest steel or plate glass by being heated to a cherry red and then driven into a piece of lead.

USEFUL INFORMATION.

Keeping Flowers.

How They May Be Preserved in All Their Fragrance and Beauty

A great deal has been written on the preservation of cut flowers, says the *Journal of Chemistry*, but the matter is still imperfectly understood by most people. It is important to know not only how to take care of them after being cut, but how to cut them. On this latter point a practical hint may be of service to our readers. It might not occur to them that it made any serious difference whether the stems were broken off or cut with a knife or scissors. A sharp knife is the right tool for this purpose, as it leaves the sap vessels of the stems open for the absorption of water, while scissors crush and compress these vessels so that their absorptive power is more or less destroyed. Like injury may be done by breaking off the stems, especially if they are tough. If the flowers are put into water immediately, the ends of the stems should be cut off with a sharp knife, as the sap vessels will probably have become clogged with coagulated matter.

Cut flowers often suffer from too dry atmosphere. It is difficult to avoid this in our artificially heated rooms, but we may at least put the blossoms in the coldest part of the room. Near a window, and especially in a bay-window, the temperature is generally several degrees lower than in other parts of the room, as you will see if you test it with a thermometer. The best authorities say, moreover, that the flowers should have the benefit of light and even of sunshine in most cases, though there is popular prejudice against exposing them to the utter. On the other hand, they suffer, as plants do, from sudden alterations of temperature and from draughts.

In the case of blossoms that fall to pieces easily, it is a good idea to let fall a drop of gum or mucilage into the center, which will glue the petals together at the base. To prevent this from running out before it hardens, the flowers should be kept upright by putting their stems through the bottom of a sieve, or sticking them in sand. With the aid of a camel's-hair brush or a pointed stick, a large number of flowers may be gummed in a short time. When flowers have been carried a long distance in close boxes or cases, they often appear withered and worthless, but with proper treatment they may be revived and restored to their original beauty. Instead of at once being put into vases and exposed to the hot, dry air of the parlor, they should either be spread out on wet flannel or moss, and covered with a dish-cover or inverted box, or else put in pans containing moss and water or wet sand, in which they can be set upright, and then shut up in the dark for a few hours. If they do not regain their freshness under this nursing, there is no hope for them; but in all ordinary cases their recovery is certain.

Butter Without Churning.

The New York *Herald* in a late number says: The art of making butter is about to be revolutionized—that is, if a discovery just made by a lady in West Nyack can be successfully put in operation. The old method of churning will be abolished. Neither horse, dog, nor hand power has a part in the new method. Its discovery was accidental. The discoverer, who has experimented with her new method many times, believes in it thoroughly.

She put the cream of several days' milkings from her pet Jersey cow in a thick cloth one day last summer, and as it was too warm to churn, placed the bag in the ground in a cool place, throwing a shovelful of earth over it so that puss could not get at it, and left it there until she came home the next day. When she took the bag from the ground she found the cream had turned to a great yellow lump of butter, and the only thing left for her to do was to salt and mark it. The buttermilk had entirely disappeared, but there was about a third more than the usual amount of butter obtained by churning.

She has tried the experiment a dozen times since and always obtained better butter than by churning. The only exception was one time when the rain soaked into the ground and mildewed the cream. She is perfectly willing to let the world have the benefit of her discovery, hoping it may in some degree lessen the hard work of farmers' wives.

Whether it is the chemical action of a particular condition of the soil on the cream, or what the cause is, she does not attempt to explain, but the fact remains that when she has buried the cream in the earth for 24 hours it is turned to butter, and good, sweet butter, too.

[The above is not new, as claimed by the *Herald*. The writer heard of such an experiment more than 40 years ago—the experimenter having claimed to have thus produced butter many times.]

KILLING WHALES WITH CANNON.—Steamers engaged in hunting for whales are sometimes armed with heavy guns or small cannon, which are discharged from the ship's deck at the whale. The harpoon which is employed and discharged from the gun is made with four umbrella-like ribs, and is fired from a cannon on the ship into the whale's body. Pressure makes it open up and take a wider and firmer hold, and the whale pulling sets off some nitroglycerine confined in the cone or front part of the harpoon. With all this the whale sometimes runs for many miles, drawing after it the ship, often at the rate of 16 knots an hour, and marking its course with blood. Two thousand feet of heavy rope are fastened to the harpoon, but this, as indicated, does not allow sufficient play for the great monster, which is often 70 to 85 feet long and weighs 100,000 pounds. Afterward, when the whale is dead, or nearly so, an iron chain is put around its body and it is towed into the harbor of the fishing company.

UNEXPLORED MEXICO.—There is much in the way of scientific information yet to be found in Mexico and the States of Central America. Mr. Wm. B Richardson, a young and promising scientist of Boston, was recently commissioned by scientists of the British Museum to take a horseback tour through the unexplored region known as Tamaulipas. He has recently returned from his explorations, having taken a year to complete his work, and having collected in that time a great mass of objects of natural history and no less than 17 specimens of birds unknown to students of ornithology. The results of his researches have been given in a lecture to a large and intellectual audience in Tremont Temple, Boston. The *Advertiser* of that city gives a synopsis of the lecture, from which we quote as follows: Tamaulipas is the most favorably located of all the States of Mexico, its eastern boundary being the Gulf of Mexico, which washes its shores for 150 miles. It is larger than all New England. It is abundantly endowed with nature's resources, fertile soil, superior climate, where the temperature never averages above 97° nor below 60°, and where east winds are unknown. A region rich in mineral and agricultural wealth, oil wells, gold and silver, and with arable land well irrigated and thickly wooded with a timber of a most valuable character for manufacturing and medical purposes and for fuel. Notwithstanding these advantages, this region was unknown until now, because up to a few years ago it was the feudal possession of a noted general, whose subjects knew no law but his, and not until the youthful explorer penetrated its wilds had civilization an opportunity to learn of this enchanting and wealthy region.

LAWYERS IN CHINA.—Up to a few years ago there was not a lawyer in the whole Chinese Empire. How, in the name of Blackstone, did the pig-tailed heathen break a will, anyway? Fancy a Chinaman dying and bequeathing $50,000 to charitable institutions, and no lawyers in the country to persuade the heirs to contest the will. No wonder China is called a benighted country.—*Norristown Herald.*

GOOD HEALTH.

INJURIOUS EFFECTS OF NOISE.—A writer in the *Popular Science Monthly* asserts that noise is one of the most injurious influences of city life. It may not be sufficiently loud to attract the attention of those accustomed to it, but, if continuous, it acts as inevitably upon the nervous system as water in dropping upon a stone. Experiments made upon animals show that when they have been subjected for a number of hours to the vibration of a tuning-fork, their nerve centers become irritated, as certainly as muscular fibers would be affected by an acid or electric shock. The injurious effect of ordinary noises has been recognized by the authorities of European cities, and in some cases the nuisance has been suppressed. Heavily laden carts are not admitted to certain streets of Berlin, and in others they are only allowed to pass on condition that the horses walk. The street cars at Munich have no bells, and those of us who live in places where these bells are not used on Sunday can testify to the relief attendant on the consequent "peace and quiet." The amount of the matter seems to be that the city dweller must regard noise as one of the necessary evils of his condition—one to be borne philosophically, and requiring a large stock of grace and patience. Happy, indeed, are they who, through the long hot months, are only disturbed in their morning slumbers by the song of the birds or the crowing of cocks.

A BUG IN THE EAR.—If you get a bug in the ear, drown him out and be quick about it too. Writers say when a bug gets into the ear, do not be frightened, but drown him with oil or warm water. There is no philosopher, remarks Dr. J. Herbert Claiborne, Jr., in the Medical Classics, who could sit unmoved with a bug or fly stamping a tattoo upon his eardrum. Yes, be frightened, for it will facilitate your movements. Sweet oil is perhaps the best thing to keep him from moving—that is, the first desideratum. The oil, by its thick consistence, will so entangle and bedraggle its legs and wings that the intolerable noise will be stopped. If oil be not at hand, use any liquid that is not poisonous or corrosive. Water will probably be within the reach of every one. This is also more liable to float him out, too, than either sweet oil or glycerine. It has been suggested to blow tobacco smoke into the ear to stupefy the insect. We cannot indorse this advice; tobacco smoke blown into the ear of a child has been known to cause alarming symptoms. When the movements of the intruder have been arrested, syringe the ear gently with warm water. All manner of insects and bugs have been found in the ear, but you can never tell in a given case who the rude caller is that is knocking at the door of your brain till you have him out.

PREVENTION OF ALL INFECTIOUS DISEASES.—The science and practice of medicine and surgery are undergoing a revolution of such magnitude and importance that its limit can hardly be conceived, says Dr. Austin Flint in *Forum*. Looking into the future, in the light of recent discoveries, it does not seem impossible that a time may come when the cause of every infectious disease will be known; when all such diseases will be preventable or easily curable; when protection can be afforded against all diseases such as scarlet fever, measles, yellow fever, whooping-cough, etc., in which one attack secures immunity from subsequent contagion; when, in short, no constitutional disease will be incurable, and such scourges as epidemics will be unknown. These, indeed, may be but a part of what will follow discoveries in bacteriology. The higher the plane of actual knowledge, the more extended is the horizon. What has been accomplished within the past ten years as regards knowledge of the causes, prevention and treatment of diseases far transcends what would have been regarded a quarter of a century ago as the wildest and most impossible speculation.

DANGERS OF CLOSE SHAVING.—It is said on good authority that very close shaving is a dangerous thing to follow up for any considerable time. One who claims to know writes as follows: "Do you know what a close shave means? I never did until I looked at a face the other day through a microscope which had been treated to this luxurious process. Why, the entire skin resembled a piece of raw beef. To make the face perfectly smooth requires not only the removal of the hair, but also a portion of the cuticle, and a close shave means the removal of a layer of skin all around. The blood-vessels thus exposed are not visible to the eye, but under the microscope each little quivering mouth holding a minute blood drop protests against such cruel treatment. The nerve tips are also uncovered, and the pores are left unprotected, which makes the skin tender and unhealthy. This sudden exposure of the inner layer of the skin renders a person liable to have colds, hoarseness, and sore throat, and it is only that the face and neck are pachydermatous—"

RULES FOR FAT PEOPLE AND FOR LEAN.—To increase the weight: Eat, to the extent of satisfying a natural appetite, of fat meats, butter, cream, milk, cocoa, chocolate, bread, potatoes, peas, parsnips, carrots, beets; farinaceous foods, as Indian corn, rice, tapioca, sago, cornstarch, pastry, custards, oatmeal, sugar, sweet wines, and ale. Avoid acids. Exercise as little as possible; sleep all you can, and don't worry or fret. To reduce the weight: Eat, to the extent of satisfying a natural appetite, of lean meat, poultry, game, eggs, milk moderately, green vegetables, turnips, succulent fruits, tea or coffee. Drink limejuice, lemonade, and acid drinks. Avoid fat, butter, cream, sugar, pastry, rice, sago, tapioca, cornstarch, potatoes, carrots, beets, parsnips, and sweet wines. Exercise freely.

ONIONS AND BEEF.—What is the most strengthening food for a convalescent? Well, you know the beef-tea theory has been exploded. The most life giving and digestible food that can be given to one just recovering from an illness is chopped beef. Just take a pound of raw beef, cut off all the fat, slice two onions, and add pepper and salt. Then chop the onions and meat together, turning them over and over until both are reduced almost to a pulp; then spread on rye bread and eat as sandwiches. People talk about celery being a nervine, but let me tell you that there is nothing which quiets the nerves without bad results like onions. The use of them induces sleep and much strength is obtained from them.—*Ex.*

NOT "SURE CURES," BUT HUMBUGS.—A writer in the *Weekly Medical Review* says: "I have collected every catarrh, asthma and hay-fever 'sure cure' that is in the market, numbering in all 58, and have carefully examined them. Eighteen of these 'sure cures' are bold-faced frauds. One ounce of quassia chips, a pound of table salt, 40 gallons of water, will make one barrel of 'sure cure' that sells for $1 a bottle, holding six ounces. The same quantity of water, a pound of muriate of ammonia, a pound of ground cubebs and a little common potash will make another 'cure' that sells for 50 cents a bottle, holding four ounces. These two are the best of the 18 frauds."

EFFECTS OF LIGHTS ON THE EYES.—The practice of having night-lights in children's bedrooms is pronounced very injurious by well-known physicians. Instead of allowing the optic nerves the perfect rest afforded by darkness, the light keeps them in perpetual stimulation, with the result of causing the brain and the rest of the nervous system to suffer.

TELEGRAPHERS' DISEASE.—Telegraph operators, it seems, are developing a disease of their own. One or two cases recently occurred abroad, in which the finger-nails dropped off one after another. The affection is supposed to be due to the constant hammering and pushing with the finger-ends required by the working of the telegraph instrument.

ENGINEERING NOTES.

A PNEUMATIC MARINE MOTOR.—John Secor's pneumatic yacht Eureka was recently launched at New York. Her construction is novel. She is fitted with a series of heavy steel tubes, the muzzles of which open under water. These tubes are divided into a series of chambers, which are filled with fuel gas and air. The contents of these chambers are exploded in rapid succession by means of an electric spark. The force of these explosions expended against the water at the ends of the tubes propels the vessel. Experiments are said to have demonstrated that this novel method of propulsion is feasible. Reversal in either direction is effected by opening suitable gate-valves at each end of the cylinder. The electric spark which causes combustion is generated between two electrodes that feed and regulate automatically, and are so arranged in pairs that should any accident happen to one it is immediately thrown out of the circuit and automatically replaced by its perfect mate. The current is derived from a storage battery.

THE BEHRING STRAITS RAILWAY.—The promoters of the Behring straits railway are encouraged from the fact that steps are being taken to build a railway from a point on the Obi river in Siberia northwest to the coast of the Arctic ocean opposite Nova Zembla, a distance of 260 miles. The proposed terminus is away up in latitude 69, nearly four degrees north of the point in Behring straits where the great Americo-Asiatic railway would cross. But although the Obi railroad would thus penetrate the regions where ice and night reign for almost half the year, it is believed that the line can be worked for six months at a time. In connection with the road it is proposed to establish a line of boats on the Obi and Irtish rivers whereby in connection with the railway the products of a vast region of Siberia can be carried to the Arctic ocean in a few days and thence shipped to London at a large saving of money and time. The cost of the proposed railway is estimated at $10,000,000, or about $40,000 per mile, equipped.

A POSTAL TUBE FOR THE CHANNEL.—One of our English cotemporaries has the following item of interest respecting the projected postal tube under the English channel, to be operated presumably by the pneumatic method of propulsion, though on this point "deponents saith not," viz.: "Whatever objections may be urged against the construction of a channel tunnel, it is not easy to discover grounds for opposing the development of a recently revived scheme. It is proposed (not for the first time, however,) to lay down a postal tube between Dover and Calais. The idea is to suspend two tubes of about a yard each in diameter by means of steel cables across the channel, 40 yards above the level of the sea. The steel cables will be fixed to pillars at distances of about 800 yards, and in each tube a little railway will run with cars capable of carrying 450 pounds in weight. No parcel of greater weight than this will be taken, and the cost is estimated at the modest figure of $5,000,000."

RAILWAY BUILDING IN JAPAN.—From the report of the Japanese Railway Bureau for the past year, which has just appeared, it would seem that, rapidly as it is progressing, railway construction in that country has to meet unusual difficulties, or rather an unusual number of difficulties, owing to the physical geography of Japan. One line of 205 miles in length involves the construction of ten tunnels, 16,000 feet long, and the bridging of 11 rivers. One of these has a velocity in time of flood of 27 feet per second, and in another the brick piers have to be sunk to a depth of 80 feet. A range of mountains is crossed at a hight of 1468 feet. Part of another line ascends to a hight of 3144 feet, and during five months of the year work is rendered impossible by the snow, and sometimes in the summer months an epidemic of cholera has the same effect.—*Engineering.*

BRIDGING THE MISSOURI.—The first bridge over the Missouri river was built at Kansas City 21 years ago and was regarded as a bold undertaking. Now 16 bridges for railways span that stream, namely, at St. Charles, Booneville, Glasgow, Sibley, Randolph, Kansas City, Leavenworth, Atchison, St. Joseph, Rulo, Nebraska City, Plattsmouth, Omaha, Blair, Sioux City and Bismarck, and eight or ten more are not unlikely to be built in the next ten years.

IMPROVED SCREW PROPULSION.—The latest method of increasing the speed of vessels is a screw which is so designed that the center lines of two following blades from spirals run in opposite directions. The blades are so curved that one has its leading part near the machinery, the other has it near the center, so that each blade cuts into the water in advance of the following. It is claimed that greater speed results.

ELECTRICITY AS A MOTOR continues to make rapid progress. There are now in operation 175 miles of electric street railways, with 310 cars, and over 150 miles, which will employ 247 cars more, are noted as projected.—*Railway Age.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Jan. 12: Mining matters move along smoothly, with no new developments of an important character to report for the past week. At the North Star they are still sinking the winze, and although the distance they intend to sink is not definitely decided, it is likely they will go 100 feet. The conditions of the rich vein of quartz are unchanged. The east drift is also being pushed ahead, in the hope of encountering a good-sized ledge. It is now in a distance of 200 feet, with an occasional small streak of quartz. Many are inclined to the opinion that the main ledge will be found west of the shaft. The Mandich Bros., who are opening up a claim a little north of the Stewart claim, are meeting with encouraging indications. Quartz sprinkled with coarse gold is found. Knight & Co. have just cast two eight-foot water-wheels, which will be shipped to the Gover mine in a few days, where they are intended to operate reversible hoisting machinery. This hoisting plant will be one of the most complete, efficient and economical to be found in the county.

DRYTOWN.—Cor. Amador *Ledger*, Jan. 12: Mining-claim owners and claim-jumpers have been busy the last week or two working on their properties. I am informed that a large body of nice-looking rock has been found in the drift at the 500-foot level of the Cosmopolitan. Considerable improvements have been made at the Gover mill and hoisting works. A steel pipe to convey water from the large reservoir on Quartz mountain has been laid to the mill, and connections made and necessary machinery put in at the mine to do away with steam and run the hoist by water. The main ditch between Sutter creek and Rancharie has been enlarged. It is rumored that the Black Hills claim has been sold to an Eastern company. This mine joins the North Gover and includes the old Pennsylvania and Loyal and is considered a good mine.

AMADOR GOLD MINE.—*Ledger*, Jan. 12: At the Amador gold mine there is the bustle and activity incident to the working of a mother lode mine on a large scale. Substantial improvements are being made all the time. The company is now building iron cars for the surface, and will soon build the tramway cars, which will hold three tons each and be patented after those at the Bunker Hill. The contract for the iron work for the new hoisting plant has been let to the Pacific Iron Works. It will consist of a No. 5 Gates crusher weighing 25,000 pounds, an eight-inch Cornish plunger-pump, and a double-reel hoisting gear of substantial size. The machinery will be run by Pelton wheels. It will take over 100,000 feet of lumber. Unfortunately for the company the bad condition of the roads has seriously interfered with the hauling of lumber and the progress of work has been retarded. An important connection in the mine was made last Saturday when the upraise from the 250-foot level broke through into the bottom of the west shaft. There are now three shafts connected with the 250-foot level, and a station has been made at the south shaft 350 feet, from which lateral drifts and crosscuts will be run.

MISCELLANEOUS.—John Wetzlar, former owner of the mining claim in Hunt's gulch recently purchased by the Morley Mining Co.—an English company—informs us that our report in last week's issue as to there being no rock in the mine is incorrect. He says there are two places where the tunnel has tapped the ledge, and from these it would not be difficult to keep a 10-stamp mill going. He admits, however, that present developments hardly justify the erection of a 20-stamp mill. W. G. Anderson informs us that he shipped three tons of quartz from the New York mine to San Francisco for treatment last week. On Tuesday he received the result of the working by mill process and assay, which gave $15 per ton. At this rate the New York claims ought to prove a veritable bonanza. The shaft of the Plymouth Con. was drained of water in the early part of the week. We have not heard the extent of the damage done in the lower levels by the water.

COSMOPOLITAN.—*Dispatch*, Jan. 12: The east crosscut is 145 feet from the shaft; the face of the crosscut is full of stringers of quartz. The west crosscut is 50 feet from the face and of the same soft slate. They will put in a 10-inch air-pipe on their blowers this week, so as to convey more air down to the drifts.

LIVE OAK.—They have a one-stamp mill on this property, which is situated near Stony creek, and they are running along as if they were satisfied. Tom and Henry Peek are running a tunnel on Schober's ranch, with the expectation of striking a ledge of quartz, which is supposed to run through the hill. They are in about 20 feet.

FOOT AND THOMPSON.—A ten-stamp mill is being erected on this property, which is situated in Calaveras county, about three miles above Big Bar bridge. The work is nearly completed, and is expected to be in running order in a month or so. This mine is worked by a tunnel.

NORTH CALIFORNIA.—The upraise broke through to the surface last Tuesday. They have the Potosi mill full of ore and started to work on the same Thursday morning.

Calaveras.

WORKS STEADILY.—Angels *Echo*, Jan. 9: The Tulloch & Lane mine, situated in the southwestern part of this town, is being worked steadily, and the mill is kept in constant operation. The ore is paying well, in fact, far better than the owners expected, averaging about $8 per ton. This mine is an extension of the celebrated Gold Cliff, also situated near this town.

THE UTICA.—Sinking is going on steadily in the north shaft of the Utica mine. The shaft is at present over 300 feet deep. It is the intention of the owners to sink it over 1000 feet. The water was turned into the new pipe last Monday for the first time. The pipe reaches from the mill in this town to the reservoir on Bald hill, a distance of about two miles. This is the most gigantic piece of work of the kind ever accomplished in the southern mines. The new 60-stamp mill is now in readiness and will be started up as soon as the nozzles for the water-pipe arrive. Everything is running in excellent condition at the Nevills mine. The Angels mine is running in full blast day and night, and making an excellent showing. The chlorine works in this town are still engaged in reducing sulphurets from the Sheep Ranch mine. The Hardy & Hayward mine at Albany Flat has been closed down.

Inyo.

COPPER.—Inyo *Independent*, Jan. 11: Samples of the copper ore now being taken out at the Alabama Hills by Isaac Hitchcock carry 27 11-17 per cent copper and 28 2-5 ounces silver per ton. This would make the value of the ore about $90 per ton. The ledge continues to show up well and appearances indicate a large ore body.

Placer.

SALE OF THE HOGS BACK MINE.—Georgetown *Gazette*, Jan. 10: In June, 1887, the property was bonded to Chas. F. Hoffman, superintendent of the Red Point mine, acting for a company of French gentlemen represented by G. A. de la Bouglise, they paying $3000 cash for the privilege of a bond to run 18 months, carrying the option to purchase the property at any time within that period on payment of $25,000. In the spring of 1888 a new tunnel was started by the French company, under the superintendency of W. C. Ralston, and pushed with all the vigor possible by means of steam air compressor and Burleigh drills supplemented by the strong arms and good judgment of the miners under the foremanship of Jack McCall. By November the tunnel had been driven over 1200 feet, and between that point and the 1300 foot station they broke through the rim, which showed that the new tunnel, which had been run over 80 feet below the old one, was also too high; it was pushed ahead, however, in cement considerably more than 100 feet, when a body of gravel was encountered through which the tunnel was pushed about 40 feet and again into cement, in which material they are still running. Two shafts are being sunk, one of which, at last accounts, had reached a depth of 60 feet without finding bedrock. On Dec. 20, 1888, about one week before the expiration of the original bond, an extension of 60 days' time was granted by the Hogs Back company, but this was not availed of by the French company, Mr. Ralston having come forward on last Tuesday, January 8th, and paid to Mr. Fitzgerald, who has been secretary and treasurer of the Hogs Back company since its organization, the $25,000, and received in return deeds to the property together with all of its stock and all papers, etc., pertaining to the property. From what we can learn of the property we believe it will prove to be one more to be added to the number of paying gravel mines which have made the Forest Hill divide famous.

MAYFLOWER.—Placer *Republican*, Jan. 11: The Mayflower's 20-stamp mill is now running day and night without any stoppage whatever. All the machinery is working very smoothly. The four ore-feeders have increased the crushing capacity of the mill, and the Eureka rubbers secure the saving of all the coated gold and of the floating quicksilver. These two additions to the old mill of the Mayflower are very important improvements. The mine is opened with two breasts in the raise from the main tunnel, one breast going straight down stream, the other due north to connect with the old works. Both breasts look well.

EUREKA.—The Eureka claim contains 2400 acres and has 3½ miles of the channel; also a water-power of no less than 80 miner's inches in the driest part of the year. A tunnel is now running to tap the channel. This work is performed by two shifts day and night. The company expects to cut the channel at 1200 feet, and the indications are exceedingly favorable. This new enterprise in a short time will add another mill to that divide and employ a large number of men. Clark & Chappellet, the most thoroughly posted miners of the Forest Hill divide, will make another big claim there.

A GRAVEL MINE.—*Tidings*, Jan. 11: The good people of Colfax are anticipating an enhancement of their prosperity during the coming year, inasmuch as the Pacific bank of San Francisco has interested itself in a mining enterprise in the locality. The bank commenced operations on their claim—gravel—about two months ago, and are sanguine of tapping a rich channel. The scene of activity is on Bear river at a point about three miles from Colfax.

PAYING WELL.—Placer *Herald*, Jan. 12: The Breece & Wheeler mine is paying richer than ever. A back channel has been struck which carries a different kind of gravel from that which has been worked. Report has it that $10,000 were taken from one carload last week.

Shasta.

LOWER SPRINGS.—Cor. Shasta *Courier*, Jan. 12: Lower Springs is going to show some of the biggest and best mines ever unearthed in the United States. The farmers got stuffed on red soil and think mining far better; but if a claim doesn't prospect on top, they think it no good, but they are fooled again. We have good mines lying idle which cannot be worked for want of money. Poor men own them and can do no good for the camp. Mr. Atkins is going to erect a furnace at the Four Mile house to crush the rock of this vicinity. He has got as good a claim as any, if worked right. The ledge seems to be a solid mass of sulphurets, which, if burnt, show up splendid prospects. Mr. Campton is still working quite a force of men on his mine. Messrs. Penrose & Walton have very near finished their contract on the Walton & Vickers claim. S. H. White has got some good ore out of his mine lately. He cannot sink on account of water. The Eastern Star mine is at a standstill. Mr. White took out about $600 from this claim seven years ago.

NIGGER HILL.—Shasta *Courier*, Jan. 12: If the mine on Nigger Hill, partially prospected by the Dunn brothers, and situated just north of town on Rock creek, is bonded and taken by a strong company, as is anticipated, there will be a great revival in quartz mining matters in that once immensely rich placer camp.

LOST CONFIDENCE.—It is understood that the Lost Confidence mine and mill will start up in the spring with a strong force of men and business will hum.

NELLIE.—Superintendent Everett of the Little Nellie mine, Iron Mountain district, reports everything moving on steadily.

DRY.—Steve Albro was over from his Quartz Hill diggings last Sunday, and says there is insufficient water for placer mining purposes so far. He has some good gravel diggings over there, but they are in the dry belt.

Sierra.

A PURCHASE.—Sierra *Democrat*, Jan. 12: Wm. T. Coleman has bought for San Francisco parties the Carrie mine, situated between the Black Oak and Live Oak mines and on the same ledge. Under the management of its local officers the Black Oak mine has developed into a property of great value. The Live Oak is undoubtedly equally valuable. There is every reason to suppose that the Carrie is identical in formation and grade with the other two. The Buchanan mine has struck richer rock than has ever before been found in the mine, and the mill is in full operation. The new 20-stamp mill of the Eureka Consolidated mine, near Summersville, in this county, belonging to Alvinza Hayward and W. Hobart, will start in operation this week. There are several thousand tons of high-grade ore on the dump ready for the mill. The new device of Louis Blanding for hanging up stamps of quartz-mills, which has been approved by all millmen who have examined it, is to be applied at once to a mill in this county.

Tuolumne.

RUNNING.—*Independent*, Jan. 12: The Experimental Gulch mill has been running this week, and indications point to a good cleanup.

THE RIBBON ROCK.—This mine, an extension of the Old Tuolumne, continues to show flattering prospects. Work is being done in a systematic way in order that the mine may be thoroughly tested before the erection of the works, which will be placed upon the mine during the year.

NEVADA.

Washoe District.

CROWN POINT.—Virginia *Enterprise*, Jan. 12: The 700 drift did not advance during the week, the time being occupied in timbering and repairing. The 700 raise is up 92 feet, having advanced 21 feet since last report. The 800 south drift advanced 24 feet, making its total length 180 feet. The face is in quartz, porphyry and clay. Have cleaned out 375 feet of the old 1100 south drift during the week. It is the intention to reopen the connection with the Belcher on this level to supply a circulation of air.

HALE & NORCROSS.—Have resumed work on the 400 level and will soon be ready to commence extracting ore from this level. On the 500 level the north drift was advanced 115 feet and continues in good ore. The stopes on this level are yielding ore of good quality. Have commenced opening a winze station from the north drift on this level, to follow the downward continuation of the ore. On the 1300 level the south upraise is now advanced 20 feet. It continues in fine-looking quartz of low grade. During the week have hoisted 734 tons of ore, and have shipped to the Merrimac mill 829 tons. Average battery samples assay $22.94 per ton. Have received bullion from the Mexican mill for last month's crushing amounting to $86,015.50.

SAVAGE.—On the 400 level the main west drift from the station was advanced 24 feet. From the north and south drifts on this level we are extracting ore from the stopes and from the south drift on this level; also from Nos. 2 and 3 crosscuts on the 600 level. During the week have hoisted 350 tons of ore, and have shipped to the Rock Point mill for reduction, 438 tons. Average battery samples assay $18.60 per ton. Total yield for the month, $24,398.63.

BELCHER.—The 200 north drift advanced 16 feet since last report and is now out 326 feet. The face is in porphyry, showing streaks of low-grade quartz. Have cut out the difference in grade in the 160 drift as far as the Belcher-Crown Point line. The drift is now in good ore to that point.

CHOLLAR AND POTOSI.—These mines are yielding over 100 tons of ore daily, upon which the Nevada mill runs 40 stamps. The electricians are still fingering the electric plant at the Sutro tunnel level of the Chollar shaft.

SEG. BELCHER.—The joint 1100 south drift advanced 35 feet during the week, making its total length 326 feet. The drift passed through 36 feet of quartz giving low assays, and the face is now in porphyry.

JUSTICE.—Have stopped the 490 level raise and west drift, and have resumed work on the north drift in order to connect with the Alta raise to afford a circulation of air as soon as possible.

CHALLENGE CON.—Have shipped during the week to the Brunswick mill for reduction 210 tons of ore, the average battery samples of which show a value of $33 per ton.

CON. IMPERIAL.—East crosscut No. 2 from the main north lateral drift on the 1100 level (Yellow Jacket) is out 19 feet. The face still continues to show vein material.

OVERMAN.—Extracted 321 tons and 800 pounds of ore, and shipped to the Vivian mill 242 tons and 700 pounds. Shipped one bar of bullion, valued at $7540.31.

CONFIDENCE.—Have shipped during the week to the Brunswick mill for reduction 435 tons of ore, the average battery samples of which show a value of $33 per ton.

ALPHA AND EXCHEQUER.—Drifting north and south on the 500. There is no change to report in the formation, which is quite favorable.

YELLOW JACKET.—Are shipping daily about 100 tons of gold-bearing white rock to the Santiago mill, and are prospecting in the upper levels.

ALTA.—The ore reserves yield about 30 tons daily, which is amalgamated or concentrated, as required, at the mill.

BALTIMORE.—Extracting some ore from the stopes and extending the 350 level drifts.

BULLION.—Drifting laterally north and south from stations in the 640 level winze.

SCORPION.—Still drifting on the 300 level. No change of material to report.

ANDES.—Work will be resumed immediately in the drifts in this mine.

Bernice District.

CUSTOM-MILL.—*Silver State*, Jan. 11: W. W. Williams of Bernice, Churchill county, is preparing to start his mill in the near future upon his own and custom ore furnished by M. W. Hoyt and others, who have mines leased in that mining district. We anticipate that the mine will be kept running for several months after starting. Bernice mining district possesses natural advantages for procuring cheap fuel, timber, etc., and this cannot be said of many mining camps. Wood can be had for $4.50 per cord. The mines are well prospected, and are in good condition to supply ore for the mill. Mr. Williams is about to add a concentrator to his already well-equipped mill.

Eureka District.

ST. PETER'S CONSOLIDATED.—Eureka *Sentinel*, Jan. 12: The new concentrating mill under the superintendency of Wm. Whalen, who is the principal owner of the St. Peter's Consolidated M. Co., was started up last week with good prospects ahead. There are 34 miners at work under the able foremanship of B. F. McBride, a miner of many years' practical experience in this district. Six men are employed at the mill, where there is at present 150 tons of ore ahead ready for treatment. The miners and millmen are paid regularly at the rate of $3 per day. The outlook, as we learn, bids well for the future, and the company has a good reserve in the bank to carry on their business.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Jan. 11: South drift on the vein in the east crosscut, 250-foot level, extended 14 feet.

COMMONWEALTH.—150-foot level: Upraise from west crosscut has been connected with west crosscut from 100-foot level, and is showing some low-grade ore. Timbering in the south and east lateral drifts is progressing well. No. 1 west crosscut has been advanced 15 feet and is looking very favorable, having cut some seams of ore. No. 2 west crosscut, running to connect with east lateral winze, has been advanced 16 feet. This crosscut will have to be run 40 feet before reaching the bottom of the winze. Line crosscut has been advanced 12 feet; the rock is the same as found in the east lateral above.

NEVADA QUEEN.—No. 2 east crosscut, 200-foot level, has been advanced 14 feet, cutting seams of spar carrying some mineral. North drift, 450-foot level, has been advanced 10 feet, and is much more favorable looking rock which shows some sulphurets. Stopes are looking very well. Only a few miners are employed stoping, as most of the ore being hauled to the concentrator is taken from the dumps, the ore-houses being kept full in case of storms. The concentrating works are running steadily; work for the week shows 87 per cent.

NAVAJO.—Crosscut from the west vein, 150-foot level, extended 5 feet. The stopes are looking better and the mill is running all right. Some time was lost at the mill during the week in cleaning the boiler.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—Steam has been gotten up in the new works, and everything moves off nicely. The water in the shaft has been lowered 15 feet.

NORTH BELLE ISLE.—Stopes above the 400 level are looking well. Good progress is being made with the Union mill.

Tybo District.

THE DIMICK MINE REPORTED SOLD.—Eureka *Sentinel*, Jan. 12: An arrangement has been made by which Eugene N. Robinson of Seligman has become interested in the Dimick mine at Tybo, the particulars of which are not at present for publication; but it is reported that Mr. Robinson gets half of the mine, and will put it in a thoroughly operative condition. The Dimick mine is said to be one of the best properties in Nye county. It has produced large quantities of ore, considerable of which has worked very high in silver and lead. Several shipments were made to the furnaces in Eureka with results netting in the hundreds. The Dimick property adjoins the Two G. mine, which in former years yielded millions, and would yet pay splendidly under good management.

Wellington District.

DEVELOPING.—Reno *Journal*, Jan. 12: For several years A. C. Pratt has been at work developing a mining property known as the Young and Fish in Wellington district, in Douglas county, and now the property promises to become, when properly opened and suitable machinery erected, a heavy bullion-producer. They have a small two-stamp prospecting-mill in operation, but owing to the scarcity of water even this small affair cannot be kept in constant operation. It is their intention to drive a tunnel a distance of 500 feet for the purpose of getting a supply of water. This has now been driven in 340 feet. There is in the neighborhood of 1000 feet of openings on the mine and from every one paying ore has been extracted and reduced in the little mill, and the mine thus far has been self-sustaining.

ARIZONA.

HARQUA HALLA.—Lordsburg *Liberal*, Jan. 12: L. B. Durnil of this place went out there a couple of weeks ago to see what was to be seen. He came back this week and the *Liberal* is able to give what he saw. For the benefit of our readers out of town who may not be acquainted with Mr. Durnil, we will say he is perfectly reliable and a man of good judgment. In the first place the strike is four days' travel from Phœnix, the nearest outfitting point, Mr. Durnil went from Phœnix by the way of Vulture, a better road, and it took him five days. On arriving there he found half a dozen men, although when he was there several prospectors punched burros into camp and pushed on, still prospecting. The limestone cap was there and the hole through it; the lime was some two feet thick and immediately under it it was said the nuggets were found, and then an iron ore which may contain gold, but it doesn't show it to the naked eye. The hole instead of being seven feet deep is scant five. The ore is all piled up there, some of it being sacked. Mr. Durnil looked it all over, and instead of finding it full of free gold he was unable to find any. The place had the appearance of being a pocket, if it is anything, and the fact that the locators discovered last November and have dug only five feet, that they will not give a working bond and want to sell for cash, seems to indicate that they, too, think it a pocket. About a mile from this opening is another ledge which runs at right angles to this one. It has been uncovered in a couple of places and has a greater show of permanence. Expert Sevenoaks of San Francisco, supposed to represent Senator Hearst, has been there and offered to bond the hole and sink on it, but the owners, Stein,

Hudson and Sullivan, refused. They want to sell, not bond. The wonderful nuggets were conspicuous for their absence. Mr. Durnil, however, saw one piece of quartz which contained free gold. It was well worn, evidently a piece of float. Mr. Durnil's opinion is that no person wants to go there except to prospect, and that there are hundreds of as good places to prospect, especially as the outfitters at Phœnix charge $25 for a burro, and other things in proportion.

MINERAL OUTPUT.—*Journal-Miner*, Jan. 10: Yavapai county's mineral output for 1887 was about $1,600,000 in round numbers. Freighting between the United Verde copper mines, at Jerome, and Witherellville has been resumed. The district in which the new strike in the Harqua Hala mountains was recently made is easy of access from Prescott. Reports say that the recent floods did considerable damage to the dam and ditch of the Etta company, at the Verde. Mr. Johnson's pack train is at work packing ore from the Catoctin mine. Geo. W. Sines received returns yesterday from a small lot of ore shipped to the sampling works from the Mollie Stark mine owned by him, in the Bradshaw mountains, which showed a value of $78 in gold. Ex Sheriff Mulvenon returned from Turkey creek yesterday. He says that the mining outlook there continues very favorable. A number of men are engaged in sinking the shaft of the Scotch Lassie. Thos. Carroll, from Jerome, says that camp is very quiet at present. The smelter has closed down on account of bad roads preventing them from getting supplies in, or the product out. About 20 or 25 men are still employed in the mines. The Crowned King Mining Co. has been compelled to close down its mill for some time, in order to put in new pans and settlers, which will take from 60 to 90 days. Mr. Place is now in Prescott to secure trains to haul their machinery to their camp. Work, however, is still being pushed on the mines, which are said to show up very large bodies of high-grade ore

THE NEW MINES.—Prescott *Courier*, Jan. 10: The rush from Southern Arizona and California to the new gold mines near Centennial, Yuma county, continues. The latest is that U. S. Senator George Hearst has paid $250,000 for the discovery location on the rich gold vein. We hear that John H. Burgess of Phœnix has a good claim in the district.

DIXIE.—Articles of incorporation of the Dixie Mining Co. will shortly appear in the *Courier*. Mr. Boaz has gone to the States to look up and ship machinery for a mill. Some of the mines have paid well.

COLORADO.

SALE.—Georgetown *Courier*, Jan. 11: Following close upon the sale of Sites' property reported last week, comes another sale of Hight's property, completed yesterday. The group of lodes is situated on the north face of Leavenworth mountain, and within the city limits of Georgetown, and is composed of the Edna Extension, Gold and Silver Coin, Burrell, Golden Eagle and Grand View No. 2 lodes. The purchaser is an English friend of Mr. West of Georgetown, who paid a visit to our mountains during the fall. The consideration was $18,000. Several other quite important sales are pending in this district.

NOTES.—The strike made on the Cashier some time ago is holding out very well. It is said that the Colorado Central mine never looked so well as it does to-day. The new owners of the Big Blue are to begin work in earnest. We understand 30 men are to be put on at once. The mineral from this mine runs high. Several of the large mining companies of Leadville have started a suit to test the validity of the tax levied upon the net output of mines, the owners claiming that the Act is unconstitutional.

DAKOTA.

THE REDUCTION WORKS STARTED.—Deadwood *Pioneer*, Jan. 8: The reduction works have started at last. On Sunday the last finishing touch was given to the machinery, when the carrier, taking the ore from the Blake crusher to the drying furnace, was completed. Supt. Clark ordered the engine started early in the day, and directed that the first run should be on salt used in roasting. The salt was thrown into the Blake crusher and went through all the operations of crushing, drying and sifting until it was shot into the bin from which it will be drawn from time to time as wanted. The machinery worked to perfection. Not a hitch, not a break, not even a hot-box. So carefully has the great mill been constructed that on the first day's trial it ran as smoothly as if it had seen six months' service. After the salt has been all ground the mill will be run on matte. This will only take about a day, and before the week is out the regular crushing of ore will be begun. Leaching will be started by the 15th, and before the 20th the last doubting Thomas who hopes the reduction works will succeed will have the actual works before him and will be converted.

IDAHO.

BANNER.—Idaho *World*, Jan. 11: Jas. Flood from Banner says the shaft on the Crown Point was down 400 feet and a station being cut out, when he left. A sump will be excavated of 13 feet below the station. This shaft was sunk to the depth of 200 feet some years ago, and a contract let three or four months ago to sink it 200 feet deeper. Both the Crown Point and Wolverine mines, owned by the Elmira Co., will be worked from this shaft. Work is still going ahead in the Banner—stoping and drifting on the 500-foot level.

MONTANA.

CAMPS OF DEER LODGE COUNTY.—*New Northwest*, Jan. 11: Mr. E. D. Holland, Supt. of the Hatta, in Dunkleberg district, eight miles southeast of New Chicago, on which operations were begun in May, 1887, informs us the 5½ by 7-foot prospecting shaft on that mine was down 315 feet on the 1st of January, 1889. At that depth water was struck in quantity that could not be pumped with the appliances at hand. He then returned to the 300-foot level and is drifting north. The ore ranges from 20 ounces up to 300 ounces. At the 300-foot level, where work is now being done, there is three to six feet of carbonate ore averaging 50 ounces. Drs. Mitchell and Mussigbrod, who own the Forest Rose in Dunkleberg district, and on which there is an incline shaft to a depth of 325 feet, where they have six to nine feet of ore, have concluded to develop it themselves by a working shaft. The shaft will be sunk 325 feet with levels at every hundred feet and at the bottom to the incline. The mine is in limestone and there is no water. There is already on the mine, besides the 325-foot shaft, an 80-foot shaft and 60-foot shaft all in ore, and the owners have expended about $12,000 in development. A large proportion of this has been returned to them from the sale of ores, they having taken out considerable quantities and shipped to Wickes, to Pueblo and the Holden Works, Denver, the shipments averaging about 50 ounces silver and between 40 and 50 per cent lead. Mr. D. M. Dunkleberg, in the same district, which is named for him, is working four men in a drift from the bottom of the 240-foot incline on the Jackson lode. He has a good vein of ore. Mr. Sam Ritchey, Supt. of the New Minnie Palmer Co., Beartown district, began work with the new company Nov. 25th with three men, got out timbers for tunnel and track, and up to Jan. 1st had pushed the header of the old tunnel 25 feet further. At last accounts the header was in porphyry. Mr. R. thinks he will strike the lead within 25 feet, and will then be at a depth of over 220 feet on the lead. The nearly 19 tons of ore shipped from the Champion mine, in Oro Fino district, to the Anaconda works, sampled 145.2 ounces in silver and $3.62 in gold per ton, and Supt. E. P. Mills was on Tuesday handed a check for $2079.50 as the net product of the shipment. This is a splendid working result from the first shipment of Champion ore.

ORO FINO DISTRICT.—*Inter-Mountain*, Jan. 10: The Champion Co. is now sinking to the 350-foot level and is getting some very flattering assays. Nineteen tons shipped to Anaconda for reduction netted the company $2078, averaging 146 ounces silver and $3 gold per ton. The Mountain Lion negotiations with a St. Louis Co. for the future development of the mine have been terminated successfully and the company will at once place a hoist and pumping plant. This district now appears to be on the high road to a successful development of the worth of these two properties, which will be ample to place it among Deer Lodge's regular bullion-shippers.

THE RED LION.—H. W. Sparks, superintendent of the Red Lion Co., was in the city to-day. The Red Lion mine is about four miles west of Cable, and the company has been newly incorporated. J. R. Boyce, Jr., of Butte, is president of the company, and Clinton H. Moore, superintendent of the Pyrenees, is one of its officers. The mine has 213 feet of levels and drifts run, and a winze 35 feet in depth. It carries free-milling gold ore. A number of eight and ten ton runs in the Pyrenees mill have yielded from $8 to $10 per ton. The company is negotiating for a mill with a capacity for from 10 to 15 tons of ore per day.

THE ANDERSON DISTRICT.—James Anderson came in last evening from the Anderson district near Radersburg, and brought with him some fine specimens from the Green copper mine, four miles north of Radersburg and about seven miles from Townsend. The shaft on it is down to a depth of 63 feet, and Mr. Anderson states he has a well-defined vein of ore ten inches in width.

NEW MEXICO.

STRIKE.—Rio Grande *Republican*, Jan. 12: Capt. John S. Crawford, well known here, has made a strike at Kingston. In driving the tunnel on the Enterprise mine he cut 32 feet of ore which runs exceedingly high, some of it assaying $3000 to the ton. The tunnel was in 600 feet before this ore was found.

NEW MILLS.—A letter from Parson's camp, on the Rio Bonito, says that 10 Huntington mills have been bought and a hundred and twenty horse-power engine. A tramway will be built from the Hopeful mine to the new mill, and it is expected there will be a big boom in that section in the spring.

OREGON.

CORNUCOPIA.—Bedrock *Democrat*, Jan. 11: Mr. H. Webb, one of the owners of the Companion mine, returned a few days since from Cornucopia and gives a most encouraging account of the future outlook of the camp. Speaking of the operations of the Oregon G. M. Co., Mr. Webb says that Supt. Smith has done more real practical work since assuming the management than was done during all the previous time. On the Red Jacket mine alone over 500 feet of development work has been done and the mine opened out in grand shape. During that time upward of $25 000 worth of ore has been run through the mill and hundreds of tons remain on the dump awaiting reduction. Mr. Webb says the coming spring and summer will bring about a new era of prosperity for the camp.

PLACER DISTRICT.—We are reliably informed that during the past summer some very rich placer prospects have been discovered on East Eagle creek, between Sparta and Cornucopia, and that a company has been organized for their working the coming summer. The company is composed of several wealthy Eastern people, which is an assurance that the mines will be equipped with all the latest appliances for extensive work. It is said that Eagle creek gives evidence of gold in paying quantities for a distance of several miles and will afford lucrative employment for hundreds of men. If this should prove true a great camp will be the result.

UTAH.

ORE SHIPMENTS.—Park City *Record*, Jan. 12: The Woodside leasers have increased their ore shipments to nearly a million pounds a week, and it is expected to make the output for market run up to a hundred tons daily. The ore body is now shown to be over five feet thick. The Crescent's large new steam pump arrived this week and the force at the mine is kept busy putting it up and laying the pipe down the shaft. A prominent mine-owner and prospector of Blue Ledge district claims that the backwardness of his district is due to the fact that so much money has been spent in the yet vain task of finding the continuation of the Ontario vein eastward. He believes that the same amount of capital put into developments further to the north would ere this have opened up the big rich vein. The Ontario eastern drain tunnel will, he thinks, develop the district in the most desirable way.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents to DEWEY & CO.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JAN. 8 1889.

395,804.—GATE—Jos. Albers, Wells, Ogn.

395 866.—PILE COVERING—Anderson & Elias, S. F.

395,876.—CHICKEN-BROODER—L. C. Byce, Petaluma, Cal.

395,957.—PULVERIZER AND AMALGAMATOR—E. Derbec, S. F.

395,700.—HAND-GUARD FOR ROCK DRILLS—B. Giovanni, S. F.

395,901.—CAR AXLE—W. Hayes, Los Angeles, Cal.

395,770.—FEED-WATER PURIFIER—A. Heberer, Alameda, Cal.

395,780.—STEAM BOILER—A. Heberer, Alameda, Cal.

395 831.—GANG PLOW—Wm. Holloway, Gilroy, Cal.

395,911.—POP SAFETY VALVE—F. A. Miller, Oakland, Cal.

395,847.—HAME TUG—G. W. Moliere, Ocean View, Cal.

395,916. — RAISIN-STEMMER — C. L. North, Fresno, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHICKEN BROODER.—Lyman C. Byce, Petaluma, Cal. No. 395,876. Dated Jan. 8, 1889. This artificial mother for chicks consists in a novel arrangement of the heating chamber, the air chamber, the chick or living chamber and the flues. The object is to provide a brooder in which there shall be an equal distribution of the heat, so that all portions of the floor of the chick-chamber shall be uniformly heated and the products of combustion disposed of to the best advantage.

GANG PLOW.—Wm. Holloway, Gilroy, Santa Clara county. No. 395,831. Dated Jan. 8, 1889. The invention consists in the novel land-gauge wheel and the mechanism for operating it, and also in the arrangement of the carrying-wheels, their crank axles and connections, whereby the plow is regulated as to depth, leveled and turned to or from the land. The object is to provide a gang plow having an effective land-gauge wheel whereby the inventor is enabled to dispense with the ordinary landsides on the plow bottoms, and generally, to provide a simple and readily adjustable implement.

PILE COVERING.—Henry Anderson, Oakland, and Hugh Elias, S. F. No. 395,866 Dated Jan. 8, 1889. The pile is first denuded of its bark and then coated with any substance or compound for preserving the wood. A metallic jacket or cover is then placed over the pile. The inclosing sheet or jacket is preferably made in one or two pieces, the edges being bolted together at the flanges prepared for the purpose. We recently illustrated and described this invention in detail in the PRESS.

DRIED-FRUIT CLEANER.—John Harrell, Plymouth, Amador county. No. 395,621. Dated January 1, 1889. This is a machine specially adapted to cleaning and freshening up or renovating dried fruit. The barrel is charged with the fruit and then rotated. Buckets or flanges within pick and carry it up and drop it through or between wires or rods which are sufficiently numerous and close enough together to cause the fruit in passing between them to scrape against them on all sides, and thus they remove the fuzz, etc., thoroughly clean the fruit, the dust and dirt dropping out through the spaces between the slots of the periphery. These spaces also afford opportunity for the sulphurous acid vapor to enter, when such is used.

CONDUIT ELECTRIC RAILWAY.—Byron Jennings, San Jose. No. 395,442. Dated Jan. 1, 1889. This invention consists of a double line of parallel surface tracks upon which the cars travel, the inner rails of which are fixed upon or formed with the two adjacent slot irons of a single underground tube or conduit, within which a single set of conductors are contained, and these serve for the two lines of cars moving in opposite directions, turn-outs and double tubes being employed where the cars meet and pass each other. The invention further consists in the employment of a means for protecting said conductors from dirt and connecting them with the cars in which the motor is situated, and a means for connecting the conductors and preventing a break in the current without the use of switches or other mechanism at points where turn-outs are constructed for the purpose of allowing the cars to pass each other.

CORK-EXTRACTOR.—George Edwards, Berkeley. No. 395,618. Dated January 1, 1889. This invention relates to that class of cork-extractors in which a frame or stock rests on the top of the bottle and the corkscrew is guided down through the foot of the frame into the cork. This patent is best described in the "claim" allowed as follows: "An improved cork-extractor consisting of a frame or stock having an annular foot and a tubular top, with notches, a tubular power-screw carried on the top and having a free lineal movement thereon, said screw having a top disk, a corkscrew the twist or thread of which is the reverse of that of the power-screw, said corkscrew having a stem passing freely through a tubular power-screw and provided with a head flange fitting on the top disk of said power-screw, the pawl or catch-bar on the top disk and having projecting ends and the notches on the stem-head flange, the handle cap fitting over the top disk and engaging the projecting ends of the catch-bar, and the nut seated on the power-screw and having projections or teeth whereby it is detachably connected with the notched top of the frame or stock."

Mining Share Market.

The mining stock market the past week was only moderatively active, with quite a spurt in Chollar and Potosi, but which fell back under realizing sales owing to the Chollar shaft breaking. With Chollar and Potosi receding, Best and Belcher and Gould and Curry came to the front under reports of an improvement in the former mine causing some of the shorts filling. The mills in the Six Mile canyon are reported to be closed down owing to the cold, freezing weather, but the other mills are running all right. The ore being crushed at the mills shows a steady increase in value. The settlement of the Sutro tunnel property is hailed with unmistakable signs of pleasure by the mining community, who now look in the near future for something more substantial than promises. The Tuscarora and Quijotoa stocks showed a fair degree of activity at a slight advance in prices. The Bodies were kept quiet at steady prices.

The new mill in the Tuscarora district, it is claimed, will be ready to start up next month on "concentrates."

For the first time, it is said, in several years, the Chollar mine, on the Comstock, has commenced regular shipments of ore. Two shipments aggregating over $59,000 have been received from the mine.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

WESTERN BASKET MANUFACTURING CO., Jan. 4. Capital stock, $100 000. Directors—C. W. Weston, G. H. Carlson, M. E. Willis, James D. Graham and Henry C. George.

LA FAVRE CONDIMENT AND PACKING CO., Jan. 4. Capital stock, $1,000,000. Directors—A. Greenebaum, T. A. Haben, J. A. Smith, Nathan Biba and S. Lebenbaum.

PRINCE OF WALES PACKING CO., Jan. 12. Object, to do a general fish-preserving business. Capital stock, $100,000. Directors—F. Cutting, F. P. Kendall, N. W. Tallant, K. C. Kent and Thos. McCauley.

PACIFIC STONE CO., Jan. 12. Capital stock, $100,000. Directors—Matthew McGowan, Thos. Butler, Alexander McLennan, E. J. McGowan and D. S. Chisholm.

GLACIER FISHING & PACKING CO., Jan. 14. Capital stock, $100,000. Directors—Thos. Pollard, E. J. Dodge, G. H. Collins, James Eva and James Madison.

PELTON WATER-WHEEL CO., Jan. 14. Object, to manufacture and sell Pelton water-wheels. Capital stock, $200,000. Directors—A. P. Bravton, Jr., Chas. J. Nickerson, Lester A. Pelton, P. Phelps and Benjamin H. Wyman, Jr.

CALIFORNIA STONE CO., Jan. 15. Object, to work certain stone quarries in Kern county. Capital stock, $25,000. Directors—George Mearns, Geo. S. Mearns, Alpheus Lewis, Robt. A. Lewis and R. B. Turner.

Meetings and Elections.

SAN FRANCISCO STOCK EXCHANGE.—President, Jere Lynch; vice-president, W. E. Norwood; secretary, Fred Hadley; treasurer, George T. Marye, Jr.; caller of the board, O. V. Walker.

PACIFIC STOCK EXCHANGE.—Louis Marshal, president; D. A. Greene, vice-president; John B. Bourne, chairman; R. C. Tobin, treasurer; George Ubl, secretary; J. Herzberg, M. S. Martin and T. O'Connor, executive committee.

BLACK DIAMOND COAL CO.—Trustees, Thomas Bell, P. B. Cornwall, J. B. Haggin, Alvinza Hayward, S. P. Smith. At a subsequent meeting of the newly elected board; the following officers were re-elected: P. B. Cornwall, president; Jas. H. Dobinson, secretary. From the president's annual report it appears that the company has had a prosperous year, with a promising outlook.

SIERRA NEVADA M. CO.—Chas. H. Fish, president; A. W. Havens, vice-president. Trustees—Herman Zadig, Con O'Connor and C. Hirschfeld. E. L. Parker was re-elected secretary and D. B. Lyman superintendent, with the Nevada bank as treasurer.

Successful Patent Solicitors.

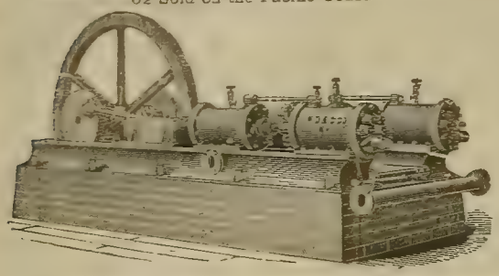
As Dewey & Co have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

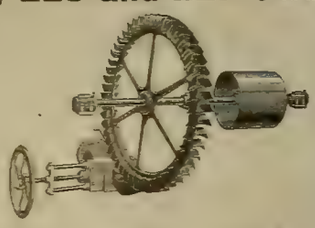
COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 225 and 227 First St., San Francisco.

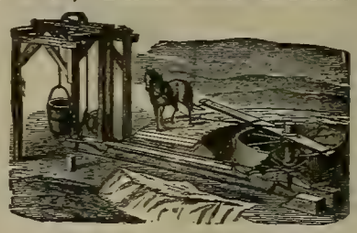
NATIONAL AIR COMPRESSORS.

SINGLE OR DUPLEX, STEAM OR BELT POWER.
62 Sold on the Pacific Coast.



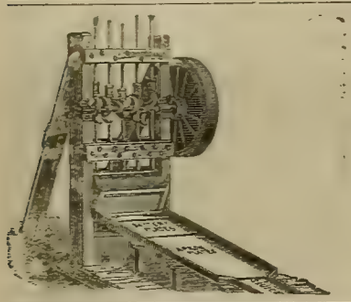


KNIGHT'S WATER WHEEL,
—FOR—
MILLS, PUMPING AND HOISTING.
Over 300 in use. All estimates guaranteed. Send for Circular.



MINERS' HORSE WHIM.
All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth of 350 feet, giving entire satisfaction to the prospector. Price, complete, $200. 150 sold on this Coast.

NATIONAL ROCK DRILL.
200 Sold on this Coast. Has less repairs than any other Drill.



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.
PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

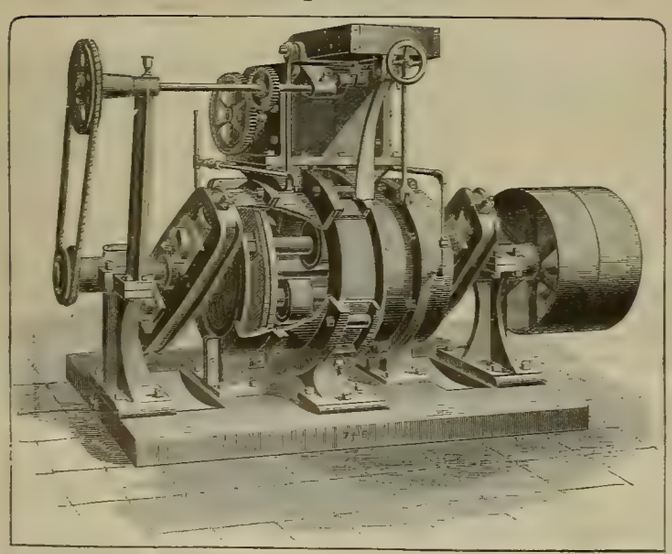
These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts.

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

Our Plates have proved the best in weight of Silver and durability. SEND FOR CIRCULAR.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884.
CLOT & MEESE,
Sole Licensed Manufacturers of the
MEDART PATENT WROUGHT RIM PULLEY
For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of
SHAFTING, HANGERS AND APPURTENANCES.
SEND FOR CIRCULARS AND PRICE LIST.

PAT. OCT. 25, 1881.

Nos. 129 and 131 FREMONT STREET, - - - SAN FRANCISCO, CAL.

E. E. EYRE, President. JOS. H. GRAHAM, Vice-Pres. & Manager. G. M. PINCKARD, Sec'y.

VULCAN IRON WORKS,

Successors to SAVAGE, SON & CO.,
135 to 145 Fremont Street, . - San Francisco, Cal.

MINING MACHINERY,

Stamp Batteries, Pans, Settlers, Etc. "Dodge" Rock Breakers, Pulverizers, Concentrators.

SAWMILL MACHINERY,

Refrigerating and Ice Machinery,

STEAM ENGINES,

CORLISS, MYER'S CUT-OFF, PLAIN SIDE-VALVE.

Shafting, Pulleys, Hanger and Boxes, Etc.

Special machinery of all kinds. We have a large list of Standard Patterns, Gears, Pulleys, Boxes, etc. REPAIR WORK SOLICITED.

RAND ROCK DRILLS

AND AIR COMPRESSORS.

Of the Machine-Mined Mineral in the U. S., in 1887, three-quarters of the Iron Ore and two-thirds of the Copper Ore were mined with Rand Drills.

THE HIGHEST AMERICAN TUNNELING RECORD.

THE STANDARD
American Rock Drilling Machinery
For Mines, Tunnels, Quarries, Sewers, Grading, etc.

RAND DRILL CO.,
23 PARK PLACE, NEW YORK.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist,
718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

....MANUFACTURERS OF....
BLUESTONE.
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco.
We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we fee confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

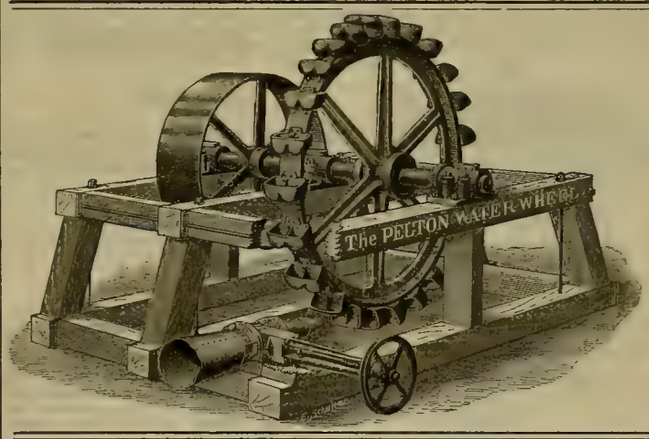
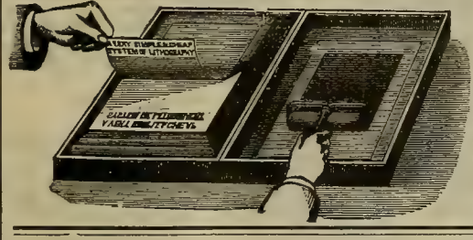
JAMES LEFFEL'S
Mining Turbine Water Wheel.
These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.
JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York.
FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.
PARKE & LACY, General Agents, San Francisco, Cal.



THE PELTON WATER WHEEL
GIVES THE
Highest Efficiency of any Wheel in the World.
A MARVEL OF ENERGY AND POWER.
Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.
It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.
ELECTRIC TRANSMISSION.
Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.
☞ SEND FOR CIRCULAR. Address:
THE PELTON WATER WHEEL CO.,
120 First Street, - - San Francisco, Cal.



THE "ECLIPSE"
Copying Apparatus.
One thousand copies in black. No special pen, no special paper, no stencil required. The "Eclipse" reproduces the natural handwriting so exceedingly faithful that in most cases "Eclipse" circulars have been taken for ordinary written letters. Specimens and circulars on application.
FELIX F. DAUS & CO.,
698 Broadway, New York.

THOMAS PRICE'S ASSAY OFFICE,

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.
Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

The BUYERS' GUIDE is issued March and Sept., each year. It is an encyclopedia of useful information for all who purchase the luxuries or the necessities of life. We can clothe you and furnish you with all the necessary and unnecessary appliances to ride, walk, dance, sleep, eat, fish, hunt, work, go to church, or stay at home, and in various sizes, styles and quantities. Just figure out what is required to do all these things COMFORTABLY, and you can make a fair estimate of the value of the BUYERS' GUIDE, which will be sent upon receipt of 10 cents to pay postage,
MONTGOMERY WARD & CO.
111-114 Michigan Avenue, Chicago, Ill.

FOR SALE.
The Empire Foundry and Machine Shop in the city of Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., etc., will be sold on easy terms. A first-rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.
For further particulars address
R. HOSKIN, Marysville.

Engraving Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Jan. 17, 1889.

Trade continues quiet, but then there are signs of business soon setting in. Large wholesale houses are replenishing their stocks of goods, and will start their traveling salesmen on the road at an early date. Collections are reported to be only fair, but as money is generally easy, this is not felt in any particular quarter. The banks report a fair inquiry for accommodations, but as the supply of available funds is said to be large, no difficulty is met by persons in negotiating good paper. For speculative purposes the call for funds is said to be light, particularly on wheat and mining stocks. The general public has no doubt been getting out of the latter, owing to the decided strong depression which set in last November, and continued well into this month. From the mining districts news continues favorable, particularly from the Comstock mines. Improvements are reported in three of the Gold Hill mines, in two in the Middle group, and in three in the North Ends, but for purposes known only to the inside, particulars are suppressed. It is very generally conceded that within the next 60 days more active and important work will be commenced in nearly all the mines at Virginia City, with crosscutting in two of the Gold Hill group. It is to be hoped that the Sutro Tunnel Co. and the mill-owners will make a reduction in their charge; for with a royalty of $1 a ton on all ores going in bullion under $40 a ton, and $2 a ton on all ore going in bullion over $40 a ton, and milling charges of $7 a ton, leaves a very small profit to owners of mines containing low-grade ore. Reliable parties place the profit last year of the owners of the mills at Virginia City on ores crushed by the mills at over $1,000,000, and on tailings, etc., at over $500,000, making a total of over $1,500,000. It is quite safe to say that the original cost of the mills was not much over that sum, which shows that there are millions in the business to the inside and assessments to the outside holders of mining stocks. It is claimed that this will be rectified by the Mining Stock Association in the course of a few weeks, unless the mine-owners themselves reduce the cost of reduction or milling. The Chollar mine is added to the list of bullion-producers on the Comstock. The shipments of bullion for December account from the mine aggregate about $59,000. The pulp assay of this mine, and as for that of the other mines on the lode, is increasing in value.

SILVER—The steamer which left this port the past week for China took out for Hongkong $142,795 in Mexican dollars, and $277,000 in silver bullion; for Yokohama it took out $40,000 in Mexican dollars, and for Hiogo, $96,000 in silver bullion. To supply the above bullion the market was well cleaned up, the Selby Smelting Works only having a few bars left over. While the price of silver was quoted in New York at 92¾c, as high as 93 1-20c was paid here—a difference in our favor of nearly one-third of a cent. The market held steady at 93 to 93 1-20c up to Tuesday, when it jumped to 93¾c, bid in sympathy with an advance abroad.

The production of silver on this coast last year is estimated at $54,348,420. The above includes the West Coast States of Mexico and also British Columbia.

New York telegrams quote silver at 93c. In our market 93c is bid, but it is claimed that a slight advance would be paid.

QUICKSILVER—The market continued active throughout the past week, with the demand both for export and home consumption. The price ranged from $42.50 to $43 a flask.

LEAD—The market is quiet, but the tone is firmer as the season for a more active demand approaches. It is claimed that the consumption on this coast will be all of 10 per cent more this year than in 1888. The value of lead mined last year on this coast is placed at $11,263,630.

COPPER—The market is dull and heavy.

IRON—There is absolutely nothing doing. Consumers are looking forward to a very active campaign this year, but as yet do not show any signs of anticipating their wants. Importers are in the meantime storing.

COAL—The market shows more life for household coal, due to a cold-weather demand and also confirmation of a reported fire in the Black Diamond mine. Large handlers of coal think the fire scare is largely exaggerated. The strike in the Wellington mine has been settled and work resumed. For spot, coal is firm, but distant arrivals and also shipments are offering at a decided concession for spot and near-by cargoes.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Jan. 17, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42½	92¾	$17 50	$3 85	$21 85
Friday	42 7-16	92⅝	17 40	3 85	21 70
Saturday	42 7-16	92⅝	17 30	3 80	21 70
Monday	42½	92¾	17 35	3 87½	21 70
Tuesday	42⅝	93⅛	17 25	3 87½	21 80
Wednesday	42⅝	93⅛	17 15	3 87½	21 75

Borax is firm at 8⅞@9¼c for refined California, and 8@8¾c for concentrated. Quicksilver is quiet at 62@63c. Refined petroleum—Barrels, 7c; plain cases, 9c. Lake copper is very quiet at $17 bid, spot, $17.20; January, $17.25; February, $17.30.

Borax is firm, with stronger feeling. Lake copper was quiet and sold nominally at $17.15@17.25. For the first three months of the year 1888 the output was 54 275 tons; in 1887, 47,633 tons. Eight hundred and thirty tons of pig lead was sold by auction at $3.85¼@3.89, and in regular market at about $3.90. Petroleum is lower than for a long period. Barrels, $7@6.90; plain cases, $9.

A DISPATCH from Victoria, B C., states that reports from the newly discovered gold ledges at Texada island are encouraging. A large number of prospectors have arrived, and already over 50 claims have been located. It is expected there will be great excitement in the spring.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Cons. California and Virginia, Jan. 12, $68,917; Hale and Norcross (for December), $89,015; Savage (for December), $24,393; Overman, 12, $7540; Hanauer, 12, $2100.

NEW ADJUSTABLE FIRE-HOSE BRIDGE.—During the past week several private exhibitions have been given of a newly invented bridge for fire hose, by means of which all stoppage of cable cars and the general blockading of traffic upon our streets during a fire can hereafter be obviated. This device, invented by B. E. Hendricksen, the architect, consists of a portable trough or cradle made of light tubing and supported by adjustable legs having extension ends whereby the elevation of the bridge can be regulated to suit any hight of car or vehicle. One section or cradle is of sufficient length to cross one line of tracks, but any number of tracks or any width of streets can be crossed by fastening the requisite number of sections together. These cradles are intended to be carried under the seats of cars or upon hook and ladder trucks, and, being light and portable, can readily be erected when required, and in this manner the great inconvenience now experienced by the cable-car companies and the traveling public generally, whenever the fire-hose is laid across the streets and tracks, will be prevented.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. G. H. LAMPADIUS—San Francisco.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Lefler, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 94 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

EXTENSIVE GOLD MINE FOR SALE.

To be sold at public auction by the undersigned, at the Merchants' Exchange, in the City of Halifax, on Thursday the Fourteenth day of March next, at twelve o'clock noon, that extensive, valuable and well-equipped GOLD MINE known as the Dufferin Gold Mine, situate on the Atlantic coast, about ninety miles east of said city. Daily mail from Halifax. Telegraph office at Salmon river, four miles from the works. Salmon river harbor never freezes, and is safe and easy of access. The mine embraces 342 areas, each 150x250 feet, all in one block. The entire area measures fifteen hundred feet in width across, and eight thousand five hundred and fifty feet along the lodes. The leases have nearly fourteen years to run, and can at any time be renewed for a period of twenty-one years, upon payment of two dollars per area. Within this area is a belt of veins dipping on each side of an anticlinal. They have been found by tests made on the surface to extend upwards of 4,000 feet. The ore has been partially removed to a depth of 200 feet over a distance of about 700 feet, and to a depth averaging about 70 feet over an additional 1,000 feet in length or thereabouts. The veins are of various width, the largest averaging about ten feet of solid quartz.

This mine was discovered in the Autumn of 1880, but was not worked to any extent until the Autumn of 1881. It has yielded up to the end of November, 31,012 ounces of gold from 64,508 tons of quartz, according to the sworn returns made to the Mines Office. The gold can be produced at a cost which will leave a very handsome margin of profit.

The mine is operated by machinery worked by water power, the power being transmitted by a line of wire rope running from the water wheel to the mine—a distance of about 4,750 feet—and lying parallel to the outcrop of said veins, at a distance therefrom of about fifty feet. The Salmon river crosses the property twice. It supplies the hoisting and pumping power, and the same water is afterwards used to drive the crusher. The latter has thirty-eight stamps, and there is ample water power to operate three times that number. Sixty stamps can be operated with present machinery. Of the 120 horse-power existing for pumping and hoisting only about twenty-five is used. There are about 700 acres of well timbered and well watered land owned with the mine. This partly covers the areas, and where it does not immediately adjoins them. It is also provided with a steam plant to operate hoisting gear and pumps in case of accident to the transmission power, a sawmill, sufficient for the requirements of the property, a tramway from the mine to the crusher for carrying quartz, and stables, offices, and boarding-houses, sufficient to accommodate a large number of employees.

The mine is owned and has been operated by a partnership, and owing to the death of one of the principal owners it has to be sold to enable his estate to be settled. A good title will be given.

Terms, ten per cent cash, balance within thirty days from day of sale. The deposit to be forfeited in case the purchaser fails to complete the purchase within that time. Further particulars can be had on reference to N. H. MEAGHER, Q. C., Bedford Row, Halifax, or to JAMES DUGGAN & SONS, Auctioneers, Bedford Row.

STOCKHOLDERS' MEETING.

OFFICE OF

The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, San Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 18, 1889, at 3 o'clock P. M. By order of the Board of Directors.

J. M BUFFINGTON, Secretary.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO., SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills one of which has been running steadily or three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to sliming, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequaled by any mill now in existence.

Yours truly, D. M. BURNS, Superintendent

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

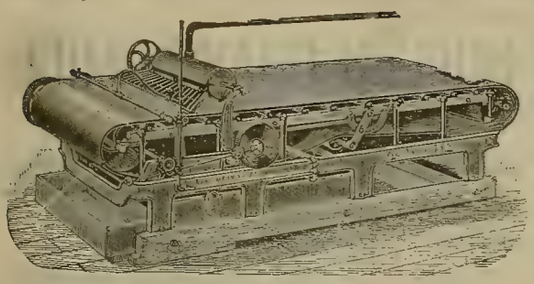
$1,000 CHALLENGE ACCEPTED,

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00).



THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

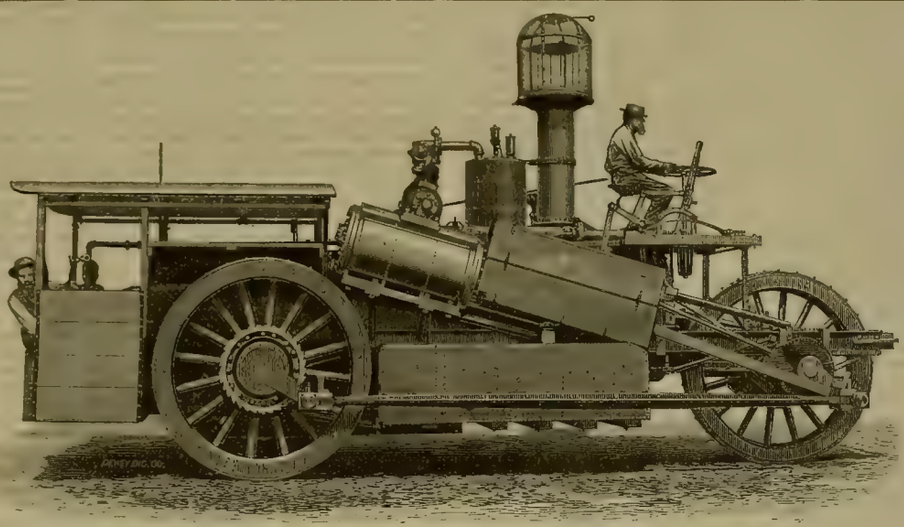
VOLUME LVII. Number 4.

A Practical Traction Engine.

For the past ten years Messrs. Roberts & Doan of Sacramento have been experimenting in building and running traction engines for the purpose of hauling freight in the mountains and plains of California. They at last succeeded in building an engine with direct connection similar to a locomotive, which has finally accomplished the long-desired point of doing away with gearing for this class of engines. It does away with all crystallizing of iron and makes traction engines practicable for hauling heavy loads.

We give an engraving of the improved engine on this page. It is mounted on springs and can be speeded fast or slow, as desired. All of the principal parts are built of wrought iron or steel, which makes the engine specially strong. The working parts are



THE ROBERTS & DOAN DIRECT-ACTING TRACTION ENGINE.

all covered in to protect them from dust.

The first experimental engine built weighs about 30 tons when in running order with steam up. It has two 19x40 inch cylinders and 150 pounds of steam are carried. The boiler is of locomotive fire-box form. There are three traction wheels 6½ feet in diameter, 14-inch face.

The engine has been two summers and falls hauling lumber at Shed 27 on the C. P. R. R., near Emigrant Gap, Placer county, California.

The road is 6½ miles in length. The engine makes two round trips per day, equaling 25 miles, with 1½ hours spare or over time each trip of six hours, hauling 25M feet of mountain pine. This partially seasoned weighs on an average of three pounds per foot, or 37½ tons, which is hauled on six large 2¾-spindle wagons, one foot wider than the regular gauge. The grades, going with a load, are from 8 inches to 16 inches to the rod, or from 215 to 430 feet to the mile. One grade of 215 feet is two miles in length. The engine runs up this grade at the rate of four miles per hour easily, if needed, but the average speed loaded is 3½ miles per hour. Most of the grade going back light is 10 to 13 inches to the rod. The road is more or less rocky, and the grade is 266 to 347 feet per mile. In places the road is extremely soft and dusty. The engine can reasonably be counted on hauling 100 tons on a level on common dirt roads, with a train of 15 to 16 large wagons, exclusive of a fuel and water wagon of 7½ tons, where the fuel and water stations are seven to eight miles apart. The engine can run loaded at a speed of five miles per hour, or faster if the road is macadamized. The engines are easily steered up-hill and

CORRESPONDENCE.

We admit unindorsed, opinions of correspondents.—EDS

Montana Gold Mines.

[From our Correspondent, R. G. HUSTON.]

The Jay Gould, located in Lewis and Clarke county, has with only a 10-stamp mill in operation, over $300,000 credited to her dividend account. Close by, on a continuation of the Jay Gould veins, are the West Jay Gould Co. properties of five locations. Development was actively prosecuted by this company during the past season, and they are so well assured of the worth of their properties that they have commenced the erection of a 10-stamp mill and have all the necessary material on the ground. Their developments consist of a tunnel driven into the mountain to crossout the vein at right angles, now in some 1300 feet; and from surveys made of the ledge they expect to strike the main vein of the original Jay Gould in less than 200 feet. At 800 feet they crossout what appears to be a parallel vein and have run levels east and west on vein 100 feet. It shows from five to seven feet of ore that will mill from $8 to $15 per ton. The outlook of this side vein decided the company to build their plant at once, and they now have everything in readiness to build. The Homestake Stemple district, formerly owned by Negus and Jacobs, who each amassed a handsome competence from its product, has changed hands lately, and the company now in possession will again set the Homestake mill to dropping stamps. Both the former owners soon after their mine had placed them beyond the reach of want paid the debt of nature, and during the administration of their respective estates the property has lain idle. The new company which has acquired the title will soon make the Stemple district known by the shipment of bullion.

The Alpha and Omega Co. properties are a continuation of the Homestake vein, and have a 10 stamp mill running on ore from the Badger mine. Not much is known of results, as it is a close corporation, and the owners do not care to show up their product to the world so long as it is satisfactory to themselves.

Mines West of the Main Range.

The Columbia and Winthrop properties, comparatively new discoveries, are located just across the main range of the Continental Divide in Deer Lodge county, on the headwaters of the Big Blackfoot. The Columbia is a contact vein—porphyry and slate formation. It is owned by Messrs. Price, Wells & Word of Helena. They have an incline shaft sunk on the vein 300 feet, and levels run at that station nearly 100 feet each way, developing an ore body on the footwall four feet in thickness. Numerous assays made from this body at different points in the levels show a general average of between $15 and $20. This is surely a flattering prospect and one that will be improved with a plant for reduction within the next 12 months.

This will be a new bullion-producer to add to the general prosperity of Deer Lodge Co., and its close proximity to many valuable known mines, such as the Drumlummon, Empire, Gloster, Jay Gould and a dozen others with large dividend balances standing to their credit, places it in a favored location. Its being wholly a gold prospect is again in its favor, as there is nothing can depreciate the value of its product.

SOUTHERN COLORADO COAL.—According to the Geological Survey, says the *Colliery Engineer*, Colorado is destined to be the Pennsylvania of the West. Within 60 miles of Pueblo there are 1,000,000 acres of coal lands, with veins now being worked from 6 to 9 feet in measurement. The coal output in Colorado for 1887 was 1,791,735 tons, of which 1,055,676 tons were produced in three counties adjacent to Pueblo on the west and south. The amount of coal in the canyon district is estimated at 150,000,000 tons. This coal is the best bituminous coal known. The retail price in Pueblo of bituminous coal for domestic purposes ranged from $3.50 to $5 per ton. What is known as "mining" or "pea" coal, used for factory purposes, sells at from $1 to $1 50 per ton. The average value of the coal on the cars at the mines is $3 25 per ton. Thus the coal production of 1887 reached the aggregate value of $3 941,817. The average number of persons employed in and around the mines during the year is estimated at 3000. The average price paid to miners for digging and loading the coal and timbering their working places is 86½c per ton of 2000 pounds of screened coal. The average cost of producing the coal on the cars at the mines, including royalty, is $1 73 per ton.

GOOD ORE.—It is stated that a mill will soon be erected on the Cleveland claim, which was recently located by John Tilton and is situated on the South Yuba river near Edwards' Crossing. The ledge, which gives surface indications of being 20 feet wide, has been run in on a distance of about three feet, and specimens of the ore have assayed as high as $100 a ton, milling test. Twenty five and one fourth pounds of samples from an extension of the Cleveland were tested by the milling process at the Nevada Metallurgical Works in San Francisco last week, and the ore paid at the rate per ton of $9 80 in silver and free gold, and the sulphurets at the rate of $17.27 to the ton of ore.—*Nevada Transcript.*

Quicksilver in California.

The Altoona Deposits of Trinity County.

At this time, when the consumption of quicksilver is everywhere on the increase while production is falling off, causing the price of that metal to steadily appreciate, whatever relates to new sources of supply becomes of interest.

During the past two or three years the price of quicksilver has advanced fully 40 per cent, but this without causing any corresponding increment of production.

That the advanced prices ruling of late have failed to stimulate production to the extent expected has been due to the desire of the owners of our producing mines to economize their resources, which they find they have in many instances been exhausting at an unprofitable and rapid rate.

The fact is, the smaller cinnabar deposits of California, though very numerous, are not likely to prove as rich or extensive as they were once thought to be. Certainly this must be so, or more of these deposits would at the present time be worked, seeing such large numbers of them were during the former era of high prices opened up and equipped with plant. That the owners of these properties distrust their value may be inferred from the fact that work upon none of them has been resumed. The common trouble with the most of these deposits is, that while they are limited in extent, the ore is of rather low grade, to which must be superadded in some cases poor natural facilities for working them.

At the Altoona or Zellerbach quicksilver mine in Trinity county, the conditions are said to be very favorable, yet, owing to the property having been involved in litigation, but little has for several years past been done with that mine.

What might be accomplished here, were the property put in shape for active production, is shown by its history in the past. Prior to the legal troubles alluded to, there was taken out here $300,000 worth of quicksilver simply with retorts, no furnace having ever been erected on the mine.

At the rate quicksilver is now selling, the value of the metal so extracted would have amounted to $450,000. Judging from recent developments, it is thought that there is as much ore standing in the same level and above the lower adit tunnel as has already been taken out.

By the inefficient and wasteful methods heretofore employed in obtaining and reducing the ore, over 30 per cent of the metal was lost, which, had it been closely saved, would have added another hundred thousand dollars to the amount actually realized. The ore already disposed of carried an average of 2½ per cent metal, at least.

The Altoona mine is on the westerly slope of the Trinity mountains in the eastern part of the county, at an altitude of 4750 feet above sea level, being about 15 miles distant in a westerly direction from Southern's station on the California & Oregon railroad. It occupies a section of a cinnabar-bearing belt that here strikes north and south along the mountain. This belt, which is composed of porphyry, traversed by occasional dykes of serpentine, has an average width of 1200 feet, and carries a great number of cinnabar veins; these veins, which vary in thickness from a few inches to 25 feet, correspond in strike with the trend of the main mineral belt.

The mining operations hitherto conducted here have been by sluicing. The ore being soft and decomposed, yielded to the shovel without the labor of blasting and picking, the mineral it contained being collected after the manner of placer gold washing. The ore so collected, after being mixed with lime, has been reduced by the slow, costly and wasteful method of retorting in ordinary retorts.

How large a percentage of the ore was lost by the plan of gathering it here pursued is shown by the fact that the tailings that escaped from these sluices have since been collected and concentrated over and over with profit.

Only from one of the veins belonging to the Zellerbach property has any ore been removed, the stoped portion of the vein having a depth of 100 by a length of 400 feet, the width of the vein at this point averaging from 4 to 25 feet. The ore taken out carried about three per cent quicksilver, and but for the imperfect manner of the treatment adopted would doubtless have yielded a larger percentage of metal than was obtained from it.

Besides some surface prospecting and a shaft sunk on one of the numerous veins to a depth of 47 feet, a vertical shaft has been put down on the principal vein to a depth of 120 feet, this shaft being connected at the bottom with a drain tunnel. We are informed that in every instance the prospecting work done here has developed high-grade ore. In the vein opened up by the 47 foot shaft, it is said there occurs fully one foot of ore that contains 20 per cent metal.

What is required to bring this property into a large and profitable production is the erection of a suitable plant, to include roasting furnace, steam hoisting works, etc., and the further development of the principal ore bodies already opened up, exploration being afterward kept well in advance of ore extraction. The owners are of the opinion that with a very moderate outlay for equipment a monthly production of 500 flasks of quicksilver could be made here. This amount could be increased by the erection of additional furnaces, and at a less cost than would be required in most other localities, there being an abundance of fine timber on the ground with water enough for motive-power a good portion of the year.

Mr. Zellerbach, who got possession of the property last August, has with limited means at his command since retimbered the shaft and had 100,000 brick burnt for the erection of a furnace, besides making various minor improvements on the mine, which, in other respects, remains in about the same condition as when work was suspended upon it eight years ago.

There is now a good wagon-road leading from Redding, on the California & Oregon railroad, to the mines, via Shasta and Trinity Center.

A similar road could, with a moderate expenditure, be built connecting this property with that railroad at a point further north, the distance to be traversed being not over 16 miles.

The Situation in Eureka District.

The Eureka *Sentinel* says: It is generally believed in Eureka that the present thinning out of our population will result eventually in benefit to the camp, for the reason that a more enterprising lot of people will come in and take the places of those that are leaving. One thing is certain, the growlers who have always claimed that there were no permanent mines in the district except those of Ruby Hill, whose ill-founded belief prevented them from ever going to see for themselves, or who never took chances in anything but day's pay in their lives, are among those who are seeking pastures new. The new-comers will not be troubled much with the nonsensical ideas of those old fossils who never had pluck enough to either combat the false impressions they received from others who pretended to know everything about mines or prospects which they never saw, but will go to work and dig up something for themselves that will pay. There are still among us a hardy lot of men who believe that there is great intrinsic merit in some of the normal prospects of which the surrounding hills are full. These are the men whose abiding faith will induce them to remain, and many of them will yet get rich. It will be strange, indeed, if some of the almost numberless prospects in this district do not eventually turn out big, but unless they are developed, if they ever prove to be worth a bean, will be a still stranger thing. The timber suits have discouraged the greater number of the inhabitants hereabout, but there are a few long-headed prospectors who are familiar with the mountains in every direction, who are here to stay, and who think this is a good time to look about them for something better than they have yet struck. Some of them will be successful, and the result will be the discovery of other such mines as the Diamond, that was recently bonded to the Salt Lake people. It is rather unfortunate that many of the more adventurous prospectors are poor, being the result of improvidence, or taking more burden on themselves than they could carry. It is unfortunate that our merchants, in times of depression such as we have to face at present, cannot carry those men who are always plying the hammer and pick in search of hidden bonanzas. It may be that some of these hardy adventurers will have to yield to the pressure of hard luck and need of help, but others will be rewarded for their perseverance. Some there are who will ask: "What shall we do with ore if we find any?" They will not have to bother much about finding a market, for although our smelters have closed up shop for the present, we have an outlet to Vallejo Junction and Salt Lake still left us. Besides, the timber troubles will not last forever. These timber suits will probably be quashed, and our representatives in Congress will doubtless find us relief at the Nation's Capital, whence the present trouble emanated, no matter whether at the instigation of mischief-makers or not. Here is a chance for Mr. Bartine to win laurels for himself.

PINE GROVE.—From a California mining-man who recently came in from Pine Grove, it is learned that that little-heard-of camp is of a great deal more importance than is generally supposed. He said, in course of conversation with a *News* reporter, that the country thereabout shows indications of great possibilities in the mining line. The country has never been thoroughly prospected. Men have located small ledges, which yielded ore assaying from $60 to $100 on the surface, worked them until the ore began to deteriorate, and then abandoned them. The Wheeler mine and the Wilson mine are the only two upon which much work is now being done. The owners of these mines are taking out considerable ore and making some money, but, our informant says, lack the enterprise to do development work, which he thinks would lead to the discovery of veritable bonanzas. The ore of the district is all free-milling gold.—*Esmeralda News.*

THE bullion product of the Hale and Norcross mine for the month of December was valued at $89 234 63, and included $39,979.80 in gold and $49,254 83 in silver.

THE Sierra Buttes Gold Mining Co. of Sierra county made a cleanup of $21,000 for the month of December.

Dry Crushing and Concentrating.

In the annual report of Randolph Adams, superintendent of the Silver King mine, Arizona, he says:

During the operation of the mine the ore from January 1st to December 25th, 28,548 tons of ore were hoisted, 22,272 tons being treated in No. 1 mill, together with 348 11 tons of old reserve, and 6276 tons in No. 2 mill, in addition to which the latter mill handled 5306 tons of old white tailings by raw amalgamation. The product included:

	Ounces Silver.
Bullion, 45 bars, containing	60,226 44
Silver sulphide, 4646.85 lbs., containing	34 867.32
Concentrations, 726,872 tons, containing	612,708.09
Total ounces silver	707,801.85

Mill No. 1 was operated throughout the year until the morning of December 31st. There was treated 22,620 tons of an average assay value of 26 91 ounces per ton, with a production of 606,665 tons of concentrates, averaging 834.55 ounces per ton. The concentrates produced represented 2.68 per cent of the ore treated, the contained silver being 47.94 per cent native, and the rest in combined form. The proportion of native was 6 01 per cent less than in 1887, owing to the treatment of ore from the 300 level, which was rich in sulphurets, but contained a small proportion of native. The average extraction by first concentration was 83 17 per cent, with a working loss of 4.53 ounces per ton. The method of second-class concentration carried on in 1887 was operated during the first five months of the year, during which time 296 tons of second-class concentrates were produced, averaging 39 32 ounces per ton, the average tailings being 2 82 ounces per ton; the final extraction was 89 52 per cent of original value of ore. There was at the beginning 210 tons of second-class concentrate on hand; 350 tons have been treated in mill No. 2, and there are 156 tons on hand which it was not profitable to handle in No. 2 mill except when treated in conjunction with first-class ore, which could not be accomplished at the time of its production.

The operations of No. 2 mill were varied and continuous during the year until October 6th, when mill treatment was confined to No. 1. In the latter part of 1887 the large pile of old "white tailings" was being utilized, while experiment was carried on in leaching ore from the 250 level. The raw amalgamation of tailings was continued through April, 5306.8 tons being treated, of an average of 10.87 ounces per ton, producing 33 660.02 ounces of silver with an extraction of 58.4 per cent and a working loss of 4.52 ounces per ton. The experimental work on leaching in the latter part of 1887 proving the efficiency of the process for the ore then in sight in the 250, and of undoubted occurrence in the 300 level, it was decided to make the necessary addition of leaching vats to convert No. 2 mill into a leaching plant. Thirteen leaching vats of eight tons' capacity, with eight precipitating-tanks, were set in double tier with the necessary adjuncts of solution and calcium sulphide tanks. A filter press was supplied, and small muffle furnace built for the roasting of the precipitate. The method employed was the ordinary leaching process, with sodium hyposulphite for extraction, and calcium sulphide for precipitation. The process was used actively during the months of March to July inclusive, treating 2146 39 tons of ore of an average roasted value of 20.62 ounces per ton, producing 4646 85 pounds of roasted sulphide averaging 15,007 ounces per ton. The average chlorination was 78 61 per cent, and the extraction somewhat better, being 79.1 per cent. The first treatment was on ore from the 250 and sill of the 300 levels, containing a large quantity of chalcopyrite and associated sulphides, though little tetrahedrite and stromeyerite. As the work progressed through the 300 level, there was a marked increase in the quantity of tetrahedrite, and the antimony contained in it caused an increase in roaster loss from volatilization of the combined silver. As efficient work in leaching required a longer roast than for amalgamation, and consequently greater loss ensued, the latter process was again instituted in June, 887.52 tons being treated in that month and July, the ore averaging 29 40 ounces per ton, with an extraction of 84.9 per cent (average chlorination having been 84 5 per cent) and a loss of 4 44 ounces per ton.

Of silver, 21,904 ounces were produced in 23 bars, averaging 457 in fineness.

When the upper two floors of the 300 had been reached, the valuable mineral was almost entirely tetrahedrite and stromeyerite. While roasting for amalgamation reduced the roaster loss, it still continued heavy, in some instances as much as 25 per cent. It then became apparent by experiment that dry crushing and concentration, while producing a product of lower market value, would more than overcome the losses incident to roasting. Arrangements were therefore made to crush dry in No. 2 mill, through 14-mesh screen, agitate the pulp in a pan with water, and treat by concentration on the second-class vanners of No. 1 mill. This method was operated from July 22d to October 5th, treating 3286 tons of ore, a mixture from the 800 and 300 levels, of an average value of 35 82 ounces per ton, with a resulting product of 120,207 tons of concentrate, containing 106,418 ounces of silver. Percentage extracted was 90 4 per cent, and the material produced was 3 66 per cent of ore crushed.

In conjunction with the amalgamating work

in mill No. 2 on first-class ore, 525 04 tons of a mixture of second-class concentrate and low-grade tailings were treated, with a product of 2½ bars of bullion 893 fine, and containing 4661 50 ounces silver.

Legislative Committees.

Following are the standing committees of the California Legislature as announced Jan. 15th:

Senate.

Agriculture—Dixon, Reed, Heacock, Langford, Flint, Hinshaw, McComas, Mead, DeLong.

Appointment and Expenditure—Roth, Welch, Hamill, Sprague, Bowers, Fraser, Byrnes, Spellacy, Hinshaw.

Attaches, Contingent Expenses and Mileage—Murphy, Fraser, Preston, Dixon, Welch.

Banks and Banking—Boggs, Langford, Preston, Hamill, Dargie.

Chinese and Chinese Immigration—Pinder, Banks, Mead, Meany, Greely, Britt, Campbell.

City, City and County, and Town Gov'ts—Moffitt, McComas, Bowers, Langford, Crandall, Roth, McDonald.

Commerce and Navigation—Spellacy, Murphy, Bowers, Langford, DeLong, Byrnes, Pinder.

Constitutional Amendments—Boggs, Heacock, Crandall, Yell, Wilson, Dixon.

Corporations—Goucher, McGowan, Campbell, Heacock, Dargie, Hinshaw, Wilson, Roth, Langford, Mead, Pinder.

Claims—Meany, Roth, Heacock, Hinshaw, Langford, Fraser, Wilson.

Counties and County Gov'ts and Township Organization—Hinshaw, Caminetti, Britt, Moffitt, Boggs, Conklin, Dray.

Educational—Caminetti, Conklin, Flint, Preston, Moffitt, Murphy, Jones.

Elections—Yell, Campbell, Crandall, DeLong, Meany, Pinder, Williams.

Engrossed Bills—Hamill, Greely, Sprague, Banks, Mead, Dixon, Welch.

Enrolled Bills—Mead, Williams, Jones, Bowers, McGowan, Fraser.

Federal Relations—Britt, Hinshaw, McDonald, Crandall, McCowan.

Finance—Moffitt, DeLong, Dray, Boggs, Langford, Caminetti, Crandall.

Fish and Game—Pinder, McCowan, Campbell, Williams, Briceland, Sprague.

Forestry, Yosemite Valley and Mariposa Big Tree Grove—Meany, Boggs, Byrnes, Wilson, Roth.

Harbors, Rivers and Coast Defenses—Langford, Bowers, Banks, Hamill, Spellacy.

Hospitals—Briceland, Byrnes, Bowers, Mead, Roth.

Immigration other than Chinese—Welch, Williams, Britt, Fraser, Conklin.

Irrigation and Water Rights—Caminetti, Bowers, McComas, Dargie, Roth, Meany, Heacock, Dixon, Mead.

Judiciary—Jones, Caminetti, Crandall, Goucher, Heacock, McGowan, Moffitt, Sprague, White, Wilson, Yell.

Labor and Capital—Britt, Byrnes, Banks, Welch, Boggs.

Mines, Drainage and Debris—Mead, Preston, Greely, Langford, Dray, Roth, Murphy, Briceland.

Military—Yell, Wilson, Jones, Goucher, McGowan, Pinder, Bowers.

Public Buildings, other than Prison—Williams, McDonald, Meany, Dargie, Moffitt, Conklin, Dray.

Public Morals—Spellacy, Briceland, Fraser.

Public Printing—McDonald, Moffitt, Dargie.

Public Swamp and Overflowed Lands—Langford, Greely, Hinshaw, Dray, Boggs.

Roads and Highways—Roth, Boggs, Hinshaw, Dixon, McComas, Flint, Campbell.

Rules—Hamill, Welch, Flint.

State Library—Murphy, McComas, Caminetti.

State Prison and Prison Buildings—Goucher, Langford, Boggs, McComas, DeLong, Hinshaw, Caminetti, Wilson, Heacock.

Viticulture—Langford, Hinshaw, Sprague, McComas, Dixon.

Assembly.

Attaches and Employes—Long, Mulgrew, Tucker, Young, Maher.

Elections—Burwell, Long, McCarthy, Hall, Stande, Davis, Brown.

Judiciary—Seawell, Storke, Hall, Shanahan, Tully, Renison, Whitehurst, Tucker, Coombs, Salomon, Hyde, Young, Dibble, Lowe, Hart.

Constitutional Amendments—Storke, Whitehurst, Hall, Tully, Coombs, Damron, Young.

Federal Relations—Renison, Shanahan, Whitehurst, Hyde, Salomon, Culver, Mathews.

State Hospitals—Mathews, Mulgrew, Burwell, Searey, Atherton, Brierly, Murray.

Internal Improvements—Kiernan, Murray, Dinon, Lowe, Edwards.

Ways and Means—Shanahan, Whitehurst, Storke, Ostrom, Mathews, Coombs, Alexander, Atherton, Dibble.

State Prisons—Adams, Black, Brannan, Ostrom, Berry, Fawcett, Simpson, Atherton, Maher.

Election Laws and Apportionment—Hall, McVay, LaGrave, Rundell, Storke, Dibble, Hersey, Edwards, Ragsdale.

Labor and Capital—Dobbin, McCarthy, Reagan, Mullaney, Kiernan, Simpson, Johnson, Williams, Maher.

Swamp and Overflowed Lands—McMullin, Crawford, Mullaney, Burnett, LaGrave, Fassett, Campbell, Brickwedel, Hook.

Water Rights and Drainage—Whitehurst, Bangs, Wear, Brannan, Ostrom, Sykes, Petrie, Turner, Chapman.

Agriculture—Berry, Adams, McMullin, Rundell, Fassett, Porter, Campbell.

Chinese Immigration—McCarthy, Searey, Mullaney, Dobbin, Tully, Chapman, Porter, Brickwedel, Hersey.

Corporations—Ostrom, Mulgrew, Berry, Stande, Seawell, Dibble, Ewing, Turner, Alexander.

Agricultural, Mining and Mechanical Arts—Tulloch, Burwell, Reavis, Frank, Atherton, Hersey, Williams.

Commerce and Navigation—Reagan, Black, Burnett, Young, Ewing.

County and Township Gov'ts—Bangs, Murray (San Francisco), Tucker, Storke, Reynolds, Culver, Coleman, Brickwedel, Chapman.

Crimes and Penalties—Tully, Seawell, Bangs, Coombs, Dibble.

Viticulture—McMullin, James, Adams, Frank, Coombs, Edwards, Brown.

Claims—Mulgrew, Black, Shanahan, Reavy, Young, Salomon, McKeown.

Counties and County Boundaries—Mullaney, McVay, Rundell, Shanahan, Renison, Ragsdale, Hart, Sims, Sykes.

Fish and Game—Frank, Reavis, Dobbin, Culver, Ewing, Murray, Mahler.

Education—Crawford, Black, Wear, Bangs, Petrie, Brierly, Turner.

Silk Culture—Dinan, James, Hall, Johnson, Coleman.

Homesteads and Land—Reavis, Crawford, Dinan, Reagan, Fassett, Coleman, Simpson.

Irrigation—Tucker, Berry, Wear, Bangs, Mathews, James, McMullen, Adams, Holmes, Davis, Brierly, Hook, Edwards.

Military Affairs—Murray, Searey, McCarthy, Holmes, Johnson.

Mines and Mining Interests—Mahler, Tulloch, LaGrave, Reavis, Gardner, Davis, Coleman.

Municipal Corporations—Burwell, Burnett, McVay, Reynolds, Seawell, Berry, Salomon, Damron, Johnson, Simpson, Chapman.

Public Expenditures and Accounts—Wear, Ostrom, Burnett, Brown, Alexander.

Boring for Coal.

In the MINING AND SCIENTIFIC PRESS of Dec. 8, 1888, page 381, we gave an illustration of the Dauntless diamond-pointed rock drill, and a description of its construction and operation. This is a core drill; that is, it is so made that the core bored is brought to the surface. It is specially adapted for coal prospecting. We give on this page a diagram showing a section of coal measures cut at Saybrook, Ill., by this drill. The work was done for Mr. H. Cheney, by the Bullock Manufacturing Co., who made the drill, and who have as agents on this coast Messrs. Parke & Lacy.

Mr. Cheney in speaking of the previous efforts to find coal in the measures referred to, says: There have been nine attempts made in all with the ordinary form of "churn" drills. In every instance the holes have proved failures, as it was found impossible to secure test cuttings that would give a definite or reliable record of the strata penetrated and at the same time tell the thickness of the different measures. While there were indications of coal, the cuttings or drillings were so mixed with the different kinds of material already passed through that I could never obtain anything like a favorable opinion from any reputable mining man as to the probability of our ever finding a paying vein of workable coal. Consequently the moneyed men in our community lost all faith in the project. So strong was this feeling that I found it useless to try to raise funds either by public or private subscription to defray the expense of having your company put down a final test hole with your improved core drills. Imagine, gentlemen, my feelings toward the old "churn" drills and the men who represent and sell them for coal prospecting, when I found that my time (eight months) and several thousand dollars had all been spent in vain with one of these "things."

The work done by your "Dauntless" drill has not only been entirely satisfactory to me, but has also removed the last lingering doubt in the minds of our citizens that we have a large and valuable deposit of coal at this point, for at a depth of 590 feet the bit penetrated a vein of coal eight feet six inches thick. I tell you it was a great triumph to see that core brought to the surface; broken in a few places, of course, but all there. It was a sight never to be forgotten by those who witnessed it.

Permit me to congratulate you upon having produced so wonderful a machine, combining great strength and beauty of design, running as smoothly as a sewing machine, "taking out a solid cylindrical core showing the exact thickness and character of every measure passed through."

The patent weighing thrust register is a most valuable addition to the machine, for it enables the operator to tell just what the bit is doing at all times, however deep the hole. I consider this of vital importance, for with this register, a two-foot rule and ordinary care and intelligence, any man can tell when the bit passes from one stratum to another and the exact thickness of every measure.

SECTION OF COAL MEASURES CUT BY "DAUNTLESS" CORE DRILL.

THE BREAKING STRAIN of iron and steel does not (as hitherto assumed) indicate the quality. A high breaking strain may be due to extreme softness. The contraction of area at the fracture forms an essential element in estimating the quality.—*Ex.*

Alaskan Placers.

No class of men require the quality of hope as those who seek for gold in the out-of-the-way places in which frugal, secretive Dame Nature has secreted it. That they possess this quality in the highest degree, the history of this coast plainly shows. So thought the Portland *News* reporter as he conversed with A. J. Long at the St. Charles hotel. Mr. Long is a typical placer miner and prospector. He landed in California in 1848. From that time until the present Mr. Long has followed with varying fortune the business of prospecting and mining. He went to all the different mining excitements, including Mariposa, Kern river, Yreka, Fraser river, and last but not least, Alaska. Mr. Long is one of the few '49ers who is possessed of a fair competence, but this does not deter him from still venturing on long tripe after pay placers.

"I returned from Alaska," said Mr. Long to the *News* reporter, "a few weeks since, and though I have mined everywhere on this coast, the best diggings I ever struck were in Alaska, and I intend to return again during the coming summer."

"In what part of Alaska were you, Mr. Long?"

"There were 22 of us in a place 300 miles north of Sitka and 50 miles from the Yukon river. It took 17 days to make the trip overland, and my back was sore from the pack of 35 pounds which I carried. We went in about the middle of July and remained until the latter part of September. While there, we had our supplies packed in by the Indians, who charged 50 cents a pound for such work. Living, therefore, was high, though a man could live economically for $6 per day, if he did not put on any great amount of style."

"How much could you take out a day?"

"Three of us worked together and we averaged about $47 a day for each."

"About how much did each of the three have at the end of the season?"

"About $4000 each. Some of the others of the party of 22, who were mining near us, took out more than we did. I intend to go back this year, and if I take out as much this season as I did last, I will give up mining. We have our sluices made and I expect we will take out more than we did last year."

"What do you think of Alaska generally as a mining country, Mr. Long?"

"I think it is a good gold country as far north as a man can live. The formation where the gold is found is granite, like it is in California. You know those red spots which used to be so rich in Placer and Nevada counties, California; well, I found them in Alaska, and they are richer, if anything, than they were in California. The characteristics of the gold-bearing country in Alaska are much the same as they were in California, with the difference that it is much colder up there. The gold was in size from the value of a mill to $4 specimens. It is fine gold, too, and sells for $17.75 to the ounce.

"I consider Alaska to be a first-class placer gold country, and any man who is a 'rustler' can make money in the mines there. You hear of many men who return disgusted from the mines of Alaska. In the days of California's greatest prosperity, the steamers were crowded on each returning trip with men who declared that California was not worth a cent, and who advised everybody not to go there. Besides this, many of those who have made lots of money in Alaska deny it for fear that the country will be overcrowded with miners and so cut off their chances of making more. Some who have made thousands of dollars there are the loudest in their denunciations of the country."

WASTE FILLING.—The superintendent of the Silver King mine, Arizona, says in his annual report that the method adopted for securing the ground with waste filling after ore extraction has been continued close up through the open ground. All levels which have been worked are now solidly filled except a small space in the upper 500 and lower 400; a few feet on the 250 level, fifth floor, and on the sill of the 143, so that the old workings are in no danger of seriously affecting the old shaft by sudden movement. In this work 2765 tons of waste were lowered from the 143 to the 300, and 1714 tons from the surface to the 350, 500, 600 and 800 levels; the remainder being furnished by sorting the ore.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ALPHI.—*Ledger*, Jan. 19: There has been a flutter of excitement over this property the past week. A company has lately been incorporated to work it on the North Star plan. Work was commenced last week in enlarging an old shaft which had been sunk to the depth of 50 feet. This shaft was sunk on the ledge, and in its enlargement to a double-compartment shaft, ore of a grade exceeding all anticipations was taken out. Pieces of quartz pounded in a mortar gave prospects indicating a milling value of from $15 to $20 per ton. Free coarse gold is often met with in the quartz, visible to the naked eye. Specimens are daily picked from the dump showing free gold. The ledge is a very strong one, judging from surface indications. It is from 10 to 15 feet wide. Of course, it is not expected that it is all milling rock, but if one-third of it is of fair grade, it will pay handsomely. It is the opinion of experts who have seen it that it gives promise of proving a big mine.

STOLCKEN & CLEVELAND.—A French company has bonded this gravel or cement claim, located at Volcano, for four months. They are busily engaged running a tunnel into the hill north of town, and expect to reach the gold-bearing channel of cement at a distance of 350 feet. They are in about 100 feet at present. The prospects are considered very favorable for the development of a valuable mine here. The gold is found in a hard cement, which has to be reduced in a stamp-mill. A number of persons have made a living by panning out in the neighborhood of this claim. So heavily freighted with gold is this cement that even a pan a day is sufficient to enable one to earn a fair living.

GOVER.—The new pipe to conduct water to both mine and mill from the main canal at a point in R. M. Ford's ranch near Quartz mountain is all laid and proved satisfactory; the two water-wheels for the application of this power are in position. This improvement is a grand step in the economical working of this property.

MECHANICS.—This mine is located 1¼ miles east of Sutter Creek. There is a strong ledge as shown by the croppings, extending several hundred feet. Negotiations are in progress looking to the bonding of this property. The mine is certainly deserving of a fair and thorough test by the approved gold-saving methods now in vogue.

ZEILE.—The shaft has been sunk to a depth of 1070 feet, at which point they are now cutting a station. This is 270 feet below the lowest level now being operated, and in this distance two new levels will be opened, one at 935, the other at 1070 feet.

MISCELLANEOUS.—At the Gillick mine near Volcano they are still engaged in crosscutting at a depth of nearly 100 feet. It is reported that the mortgagees of the Amador Queen mine have granted the company 60 days extension of time to pay off the liens; that is, they have agreed to wait that long before taking steps to foreclose. At the Talisman they are engaged in drifting north at the 800-foot level, with very encouraging prospects. The Keystone is still sinking. They have attained a depth of 1400 feet. The stockholders of the North Gover are seriously contemplating organizing a company to take a bond of the property and develop it on the same principle as the Drytown Consolidated and other mines. This mine joins the Gover on the north, and according to all reports is a very promising location.

STOPPED AND STARTED.—Cor. Amador *Dispatch*, Jan. 19: Quite a stir was caused here on Monday last, by the announcement of the failure of the Lambing mine on Dry creek. The miners are all thrown out of employment, and are often seen on the street discussing how to proceed to get their money; about $1500 is due them for work. On Wednesday a compromise was effected by which the attachment was released, and the mine will probably resume work. It is said that some of the disaffected miners will not be permitted to work.

Calaveras.

PLACERS.—Angels *Record*, Jan. 17: The insufficient supply of water has impelled placer mining to a considerable extent, though some claims are making preparations to pipe as soon as an abundance of water is assured. Among these is the claim in Douglas Flat, owned by Chas. Prey and Kuhn, who will commence piping to-morrow. Billy Thomas is working an offshoot of the great central mill channel. Many are of the opinion that there is a continuation of this offshoot down toward Six-Mile creek. There are numbers of mining men in town looking up mining property. There can be no doubt that in the early spring, increased activity will be noticeable in mining matters.

WEST POINT.—Calaveras *Chronicle*, Jan. 19: The Blazing Star mine and mill are running night and day. Rumor says that the Lone Star will soon be started with a heavy force of men. Work is progressing favorably at the Riverside, with good prospects ahead.

El Dorado.

GRAVEL.—Placerville *Observer*, Jan. 15: Jim Marshall is reported to have struck rich gravel in the old Kendall mine at Dogtown. Rich cement gravel is now being taken from the Linden mine on Cedar ravine. Supt. E. B. Burdick is pushing the tunnel at the Equator mine with all possible speed. The Equator promises to be one of the prominent mines of this county.

SEAM.—Georgetown *Gazette*, Jan. 17: John and Geo. Buchler have struck a rich-paying seam on their premises in the southern limits of town. The seam is about three inches wide, and the boys are sinking on it in the midst of their vineyard. How much they have taken out is not known to the public, but judging from the fine lot of specimens which the boys have shown, and the character of the gold, it is believed they have uncovered a big thing.

Inyo.

BORAX.—Inyo *Independent*, Jan. 19: The Coleman Borax Works, now idle, are expected soon to resume operations on a large scale. The Charlton Borax Co. delivers three 18-mule loads of borax weekly—perhaps 30 tons. Much is expected from the revival of the borax and mining industries of the desert when the narrow-gauge shall have been extended from Keeler.

LOCATED.—Quite a number of mining claims have been located during the past few days. Some are new claims and others are mines upon which the assessment work had not been done and are relocated.

Kern.

SULPHUR.—*Kern Co. Echo*, Jan. 17: While surveying recently in the San Emigdio country, Willis Cheney discovered a very rich deposit of sulphur. Much of the rock looks like pure sulphur and is readily ignited with a single match. Mr. Cheney, W. B. Carr and several other prominent gentlemen of Bakersfield have located claims.

Mariposa.

PINE TREE.—Mariposa *Gazette*, Jan. 19: We understand that work on the Pine Tree mine near Bear Valley is to be prosecuted with greater force than heretofore. Burleigh drills are to be used, and pipe is already ordered to convey water to the mine. They have about 15 men at work.

WATER SCARCE.—Miners all over the county are complaining about the scarcity of water. A good rain of a few days would be of immense benefit every way to us now. The ground is wet, but the creeks are low, and consequently miners cannot work to any advantage. Capt. Diltz was in town one day last week, and reports the lack of water as interfering seriously with work at his mine. He can do nothing except timber up and get ready to utilize the first rain which falls. With 12 inches of water, Capt. Diltz could do a vast amount of work washing down the sides of the mountain and exposing the rich strata which form his mine. He has a project which we hope he may be able to carry out, of going to Pittsburg and procuring pipe to convey the Snow creek water to his mine.

THE GRANT.—There is a rumor afloat that there has been a change in the ownership of the company controlling the Mariposa Grant. Just where and how the report started we are unable to say, but we give the voice of the whole county when we say we hope it is so, if it will make any change or improvement in the condition of matters. Over a year ago when the present owners bought the big estate, people rejoiced and many of them rushed into needless extravagance and expenditures because the Grant was sold and money was to come with amazing velocity. But all the year of 1888 passed without much tangible good resulting from the purchase, and it begins to look as if 1889 would follow in the same way. True, some quiet prospecting has been done, and some scant improvements have been made, but none of the grand achievements which might have marked the year in our country's history have been made.

WHITLOCKS.—Mariposa *News*, Jan. 12: The work of sinking the shaft below the bottom of the old works of the Grove & Ellingham mine is progressing rapidly. It is now down about 25 feet on the ledge and the rock looks well. The vein is about four feet wide. About 50 pounds of ore has been sent to Hite's Cove to be assayed. The indications are that this will be one of the best mines in the county.

RED CLOUD.—Things are at a standstill at the Red Cloud. Work has been suspended some weeks. The pumping machinery was stopped recently. The company are owing about $10,000, mostly to the miners. They cannot pay it without another assessment. They want the miners to run the mine till they get their wages out of it. The miners cannot well do so as, it will take about $1500 to get to the pay chute. So the matter rests and Red Cloud is idle.

COULTERVILLE.—Mariposa *News*, Jan. 19: The celebrated Cook mines are about to be sold to a foreign syndicate. There is now on display at McCarthey's drug store two of the rarest specimens of gold known to mining, that is, two pieces of pure crystallized gold. They weigh $50 and $90. These are the purest and most perfect specimens known. They were taken out of the Defiant mine, owned by J. M. Murphey and P. M. Lower. It is located on the ridge between Solomon gulch and the North Fork.

THE GRANT.—Senator Jones has purchased Flood's interest in the Grant. There will be no change in the offices at all. The company has ordered pipe from New York, so as to use Burleigh's in the Pine Tree mine, using compressors from the river.

WHITLOCK'S.—Grove & Ellingham are getting along finely with their mine at Whitlock's. They have sunk a shaft about 260 feet, and have struck an eight-foot ledge, which is said to be very good, so we learn.

HART'S.—Hart's mine at Sebastopol is in first-class working order, and work will be begun at once.

Nevada.

SINKING THE SHAFT.—*Tidings*, Jan. 17: It has been resolved by the directors of the W. Y. O. D. Mining Co. to sink the shaft on their property to a depth of 600 feet before pushing other development work. A depth of over 360 feet has been attained to date and the work is being diligently prosecuted by men working in eight-hour shifts. Gold-bearing stringers are cut frequently. Progressing as at present, the depth desired will have been obtained four months hence.

NORTH BANNER.—Grass Valley *Tidings*, Jan. 21: Unless all signs and indications known to mining men fail, the North Banner Mining Co. will during the years to come be substantially rewarded for the faith and indomitable perseverance displayed in its operations. The mine is paying its way and each month contributing to the treasury nest-egg. Developments at the North Banner during 1888 warranted the construction of a new and approved mill and pointed out the necessity for a departure in the method of mining in force. This was by tunnel, the lowest of which was 1000 feet in length and about 300 feet from surface at its face. Deeper working was required, so an incline shaft was started in the tunnel and an upraise to surface made. Down the upraise water was conducted by pipe, hoisting and pumping machinery were set up in the tunnel, a Pelton wheel attached and work proceeded. The pump is one of eight inches, yet the water used to drive it and the hoisting machinery does not exceed eight miner's inches. The shaft is now over 90 feet below the floor of the tunnel and depth is added daily by nine men working in eight-hour shifts. In the face of the shaft the ledge shows up encouragingly. The new mill is of ten stamps with all the latest and tested gold-saving accessories, and is handily situated at the mouth of the tunnel spoken of. This, too, is run by water-power, Pelton wheels being employed. Thirty-five men all told are in the employ of the company." What ore is being extracted is coming from the tunnel backs where the ledge is from three to four feet in size. The weekly cleanups (not complete by any means) average 100 ounces of gold aside from the sulphurets, which are very rich. The mill is run day and night. Fourteen dollars in free gold per ton is found to be the yield. This, under existing circumstances, is equivalent to a yearly profit of from $25,000 to $30,000, and should the returns not materially vary it is contemplated to add 10 or even 20 stamps to the mill two years hence. Although the North Banner is situated in Nevada mining district, it is owned and operated by Grass Valleyans.

THE BIG SHAFT.—Eureka *Sentinel*, Jan. 19: President Fries, of the Eureka Consolidated Mining Co., lately told a representative of this journal that his company would begin sinking the new deep shaft in the early spring, if the Richmond would chip in its share. He thought the work of draining Ruby Hill should be done on joint account, as the Richmond would derive quite as much benefit as his company. He had little faith, however, in the Richmond joining in the enterprise. Mr. Probert seems to be strongly opposed to the arrangement and nothing can be done without his consent. Mr. Fries thought his company would not undertake the work alone; and so they stand.

Placer.

THE HATHAWAY MINE.—*Herald*, Jan. 19: We are informed by Mr. F. X. Lavalle that the mill and hoisting works on the Hathaway mine are running. Mr. Lavalle considers the hoisting-works superior to any before erected in the Ophir mining district. The ledge is three feet in width, and has averaged for the 400 and odd tons that have been crushed, over half an ounce to the ton. Even with ore of a lower grade, the mine is a valuable property, since its width enables the company to get out ore in such quantities that the proceeds will equal those of ledges carrying high-grade ore.

Plumas.

GENESEE.—Cor. Greenville *Bulletin*, Jan. 17: There is at present little doing in the mines of this district. None of the mills or arastras are running, although some ore is being taken out. A short time ago $150 worth of gold was obtained in two days from a new ledge found within the Green Ledge lines. The quartz from this new find was coarse and hungry looking; the kind of ore a theoretical miner would not look at; thus proving once more that gold is wherever you find it. Work in the Genesee shaft will be resumed as soon as there is a certainty of being able to run without interruption from cold weather. This part of the country will be an interesting one this coming season in a mining sense, as good bodies of ore are expected to be developed.

Shasta.

A BIG MINE.—Redding *Free Press*, Jan. 17: From George Klein, who was down from Deadwood Thursday, we learn that on the invitation of Mr. W. T. Coleman he visited the Montezuma mine, which he sold to him two years ago for $5000. The mine is near the summit of Trinity mountains and he entered the tunnel in Shasta county and came out in Trinity county. After entering the tunnel he traveled for 900 feet west, then at right angles for 200 feet, which brought him into the Montezuma ground, where he found a force of men extracting ore from a vein over eight feet thick, every pound of which was good paying ore. Such a sight can only be appreciated by an old quartz miner. The stope is up about 30 feet and it looks as if there were no end until the surface is reached, a distance of 150 feet. The quartz in the bottom of this tunnel seems to go down in good faith and the ore shows free gold to the naked eye. As Mr. Coleman is a very energetic man he will soon prove that this is the boss mine of the two counties. The Brown Bear mine after making some repairs during the holidays started up, and as usual is running on first-class rock. The Little Gem mine, which the company purchased from Gibson, is proving itself to be not only running west but also east from the gulch, and is turning out very rich ore. The McDonald mine is turning out rich as usual.

WHISKYTOWN.—Redding *Free Press*, Jan. 17: The neighborhood of Whiskytown is having quite a mining boom. General Cunningham of San Francisco having succeeded Mr. Ferebush as superintendent of the Iron Mast mine on Grizzly gulch, has placed a large force of men to work on its further development. Farther up the gulch Geo. Knox is taking out some excellent ore from the Emigrant mine, and his arastra is kept constantly at work with good results. Charles Barnes is opening up a back channel on the old Dr. Belt placer mine and is well satisfied with his prospects. J. S. Strode and Joseph Jones have taken out some fine ore from a pocket mine near the town. The vein is somewhat small, but yields a good supply of the precious metal. Many new prospectors have arrived. There is not a vacant cabin on the gulch and many new ones are being erected. The old-time appearance of the gulch and surroundings is renewed and Whiskytown is again lively with business.

MINING INTERESTS.—Redding *Free Press*, Jan. 19: Now that the Walker Bros. are interested in Old Diggings and the Sierra Butte Mining Company has purchased Jack Conant's big mine on Squaw creek, the mining interests of Shasta county have been materially advanced. Capital we have long needed to develop our mineral resources. Until Wm. T. Coleman became interested in Deadwood that camp was imperfectly known and hardly worthy of attention, but now its reputation is established. In Old Diggings there are numerous good locations, notably the Hart & Day mine and the property owned by Riley & Bliss. The Walker Bros. have plenty of capital, and when their locations are developed the whole district will boom.

Siskiyou.

SUSPENSION OF WORK.—Yreka *Journal*, Jan. 19: The cold weather lately has caused a suspension of mining in most of the mining camps, on account of freezing the water supply, and obliging ditch-men to empty their ditches, as once frozen over they would be useless for some time. The weather will no doubt change to warmer temperature in a few days, with prospects of more storms to make good times for miners. The quartz miners continue to get out quartz from the tunnels, and those engaged in drifting can also continue work, but other mining requires warmer weather than at present, as the ground is frozen as well as the water in the small streams.

Sierra.

BALD MT. EXTENSION.—*Mountain Messenger*, Jan. 17: The upper main tunnel of the Bald Mountain Extension Co., three miles by the road above Forest City, was at latest advices in 2300 feet; face, soft-picking rock with considerable water. Twenty-eight feet were made last week.

San Bernardino.

RICH ORE.—San Bernardino *Index*, Jan. 15: Yesterday an *Index* reporter was shown at the office of Evans, Linville & Evans, some handsome samples of ore from the Black Metal mine, on the Colorado river, about 50 miles south of the Needles. The mine is the property of Monaghan & Murphy of the Needles, and Pete Maguire. It is worked steadily, the ore being sorted and the finest quality being shipped to San Francisco, where it is sold to the smelters all the way from $200 to $400 per ton. The low-grade ore which will not pay to ship is thrown on the dump, where there are now fully 1000 tons of ore that will work $35 per ton. It is reported that the owners of this rich mine are negotiating to sell it to parties in Los Angeles for $55,000. In case the sale is made, reduction works will be put up on the site, and work will be prosecuted on an extensive scale. This will add another prosperous camp to San Bernardino county.

Trinity.

TRINITY CENTER.—*Journal*, Jan. 17: There will be a big boom in mining as soon as the roads are opened This end of the county, especially in Coffee Creek district, is as little known as it was 25 and 30 years ago. There have been some fine mines discovered and lots of gold taken out during the past summer and fall; there is room for many more here and plenty of good, pure mountain water the year round, and wood to be had for cutting it.

Tulare.

MICA.—Tulare *Times*, Jan. 17: At a depth of 755 feet in the artesian well being bored on the ranch of C. G. Lamberson, near Tulare Lake, a bed of mica, six inches thick, was bored through. Just before striking this bed of mica a flow of water was found, and under the mica was a bed of blue clay or soil. This is the well in which gas was found at a depth of 444 feet, and which when lighted at the top of the pipe would burn all night. The first gas flow was shut off, and smaller flows have since been found and closed, as the well is being sunk with the object of getting water and not gas.

Tuolumne.

COARSE GOLD.—Tuolumne *Independent*, Jan. 17: The sight of about $700 worth of coarse placer gold this week reminded us of the days long gone by, when it would merely be a drop in the bucket, and was a heap easier to get than eggs.

CARRIE.—J. L. Tonkins, an experienced manager, has been appointed superintendent of the Carrie mine, recently purchased by Messrs. Wm. T. Coleman and A. F. Cooper of San Francisco. It is located at Soulsbyville, between the Black Oak and Live Oak mines, being on the same vein, and is expected to prove equally as rich as these splendid properties. Mr. Tonkins will immediately commence the work of sinking and development, and proceed to erect the necessary buildings.

NEVADA.

Washoe District.

SAVAGE.—Virginia *Enterprise*, Jan. 19: On the 400 level the main west drift has been extended 36 feet. Southwest crosscut No. 2 has been advanced 43 feet. From the north and south drifts on this level ore is being extracted from the old stopes. During the week have hoisted 402 tons of ore; have shipped to the Rock Point mill 498 tons, and have reduced 490 tons. Average of battery assays, $21.36 a ton.

HALE & NORCROSS.—On the 400 level the south upraise has attained a hight of 51 feet. Have not yet commenced extracting ore from this level. On the 500 level the north drift is out 133 feet and continues in good ore. The stopes above this level are yielding ore of good quality. Have completed the winze station and have commenced sinking in the ore below this level. The stopes from the 600 to the 700 level continue to look well and are yielding the usual amount of ore. On the 1300 level the south upraise has attained a hight of 33 feet. It continues in the same fine-looking quartz and shows bunches of good ore. Have started a drift north from the station on this level which is out 62 feet. During the week have hoisted 1170 tons of ore; have shipped to the Mexican mill 1059 tons, and have reduced 1076 tons. Average of battery assays, $23.75 a ton. Have bullion on hand and previously shipped for the month amounting to $32,172.

CHOLLAR & POTOSI.—These mines are yielding over 100 tons of ore daily, upon which the Nevada mill runs four stamps. The electrical plant has not yet started up. The company has shipped to San Francisco $42,593 since the Nevada mill started up on their ore.

CON. CAL. & VA. — Ore is being stoped from all the levels from the 1400 down to the 1950 level. The usual amount of ore is being shipped to the Morgan and Eureka mills, and the average of battery assays will be about the same as last week—some $30 a ton.

CONFIDENCE.—The raise from the 1200 level still shows fair ore. On the 1300 level the south drift is in material that carries some metal. The usual amount of ore has been shipped to the Brunswick mill. Average of battery assays, $33.

GOULD & CURRY.—A drift from the 300 level upraise is encountering promising stringers of quartz. The north drift on the 450 level is in material carrying some metal. A considerable amount of repair work is being done on the 625 level.

JUSTICE.—The north drift to the Alta upraise is being pushed as rapidly as possible, as a circulation of air is needed. The ore-producing sections are looking well. The mill is crushing about 40 tons of ore a day.

CHALLENGE CON.—Are shipping about 200 tons of ore a week to the Brunswick mill. Battery sam-

ples average about $32. Have sent below $11,542, the proceeds of 975 tons of ore worked in December.

BEST & BELCHER.—The north drift on the 300 level continues in material that shows value by assay. The winze below the 300 level is in favorable looking vein material.

OVERMAN.—During the past week 270 tons and 800 pounds of ore were extracted, and 335 tons were shipped to the Vivian mill. All work is progressing about as usual.

ALPHA & EXCHEQUER. Good headway is making in the drifts north and south on the 500 level. Quartz streaks carrying some metal are occasionally encountered.

BELCHER.—The 200 level north drift is out 336 feet. A pipe and blower have been put in to drive out the foul air. Good headway is making on the 160 to connect with the 200 drift.

CROWN POINT.—The raise on the 700 level connected with the old southeast drift on the 14th inst. Are now clearing up and timbering the drift.

OCCIDENTAL.—Are still extracting ore from the 300 level. It is of good quality. Some fair ore is also coming in from the 500 level.

NORTH OCCIDENTAL.—Ore assaying $40 a ton is still being taken out in small lots. Some ore is also being extracted from the 250 level.

OPHIR.—The south drift on the 1465 level continues to be advanced in vein material composed of clay, quartz and porphyry.

SCORPION.—During the past week the west crosscut on the 400 level was extended 14 feet, making a total distance of 282 feet.

UNION CON. & MEXICAN.—The joint north drift on the 1465 level is in Mexican ground a distance of nearly 500 feet.

SIERRA NEVADA.—The southeast drift on the 520 level incline rise is passing up through quartz showing value.

ALTA.—Ore-producing sections yielding as usual. The mill is running steadily and the concentrates show well.

YELLOW JACKET.—Are shipping to the mills 100 tons a day of fair ore, and are doing some repair work.

CON. IMPERIAL. — No. 2 east crosscut on the 1100 level is a mixture of clay, quartz and porphyry.

BALTIMORE. — Much good ore is being extracted and stowed away on the 350 level.

SEG BELCHER.—The joint drift on the 1100 is out 363 feet. Face in porphyry.

UTAH.—Main west drift on 600 level still in soft vein material.

ANDES.—Work will soon be resumed in the lower levels.

Golconda District.

IRON ORE FOR FLUX.—*Silver State*, Jan. 17: General Buckner, who owns a large deposit of iron ore in Winnemucca mountain, has entered into a contract to supply several tons of the ore daily to the Adelaide Copper Co. at Golconda, who use it for flux. A road is now being built up Winnemucca canyon to the mine, and when it is completed the ore will be hauled by teams to the railroad and shipped thence to Golconda by rail. This ore, it is said, makes better flux than that brought from Palisade or Utah, as it contains very little silicate.

Tuscarora District.

GRAND PRIZE.—*Times-Review*, Jan. 19: Winze No. 1, 300-foot level, has been extended downward a distance of 7 feet and shows a width of 2½ feet of good ore in the bottom.

NEVADA QUEEN.—The north drift, 450-foot level, has been advanced 13 feet. The face is showing some low-grade ore assaying $13 per ton. The stopes continue about the same, but are being extended farther north. East crosscut from west gangway has been extended 18 feet. The concentrator has been running steadily and is doing good work. The heavy storms and cold weather have not interfered with the running. The assays show the work to be 80 per cent average for present month.

COMMONWEALTH.—225-foot level: No. 1 west crosscut from south drift has been advanced 14 feet through seams of ore. No. 2 west crosscut has been extended 14 feet, showing faces of good ore. Line crosscut to the east has been advanced 18 feet. 300-foot level: No. 1 west crosscut from the station has been advanced 18 feet. Gangway has been advanced 11 feet. Rock continues hard.

NAVAJO.—An upraise has been started in the vein south of the stopes above the 350-foot level, and is showing some good ore. The stopes continue to yield the full amount and are looking well. Mill is running all right.

NORTH BELLE ISLE.—Intermediate drift south from No. 1 winze below the 300-foot level has been extended five feet, showing low-grade ore. Everything running well.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—The hoisting machinery is running nicely; shaft has been sunk and timbered seven feet.

BELLE ISLE.—South drift from east crosscut, 250-foot level, has been extended eight feet in vein matter giving low assays.

FOUND TREASURE.—Branch drift, 150-foot level, has been extended four feet.

ARIZONA.

NOTES. — Prescott *Courier*, Jan. 16: Charley Quinn, a No. 1 miner, who has been delving in Diamond Joe's Congress mine, west of Prescott, arrived in town yesterday. The deepest workings are, he says, about 560 feet below the surface and rich ore abounds everywhere. Crosscutting the largest vein is progressing very favorably. His idea is that the Congress is the greatest gold mine in the West. Between 60 and 70 men are at work there. The Catoctin, 12 or 14 miles south of Prescott, is another favorite property. It has produced a great many tons of rich silver ore. The vein is said to be five feet thick. John F. Blandy, M. E., is here from Upper Lynx creek, where snow is now quite deep. Miners are, however, pushing things, and will have plenty of ore to ship as soon as weather and roads shall have settled. Mr. Moore, of the Ore Sampling Works, is preparing several odd lots for shipment. Although snow is quite deep in the Hassayampa district, work is kept up on the Senator, Storm Cloud and Howard mines.

PLACERS.—*Journal-Miner*, Jan. 17: The owners of the Lynx Creek placers are looking forward to a big and productive run this year. The snowfall near the head of Lynx creek will no doubt furnish an abundance of water for an unusually long season this year. These diggings have already yielded thousands of dollars in gold, while hundreds of thousands more are in sight. The mines belonging to Shirley & Sattes, located in Crook canyon, have lately been examined by two different mining experts. Their reports being favorable, the properties have been bonded to Eastern capitalists. Considerable work has been done on the Alligator and Washington mines during the past three months, and it is reported that there is sufficient pay ore in sight to justify the erection of a 10-stamp mill. The ore carrying a great deal of sulphurets, concentrators will have to be used.

TOMBSTONE.—The Tombstone *Prospector* says that the rich discoveries of the past week in Tombstone district and vicinity have been the means of inducing many miners to go to work, and never before in the history of the recent years has so much work been going on in this district as at the present time. It does look as though an era of prosperity had at last settled down on the old camp, and that those who have stood by the ship when she was on the verge of foundering were to receive their reward for their faith in the fickle goddess.

BRITISH COLUMBIA.

MADE TWO CLEANUPS.—Donald *Truth*, Jan. 15: The latest news from Perry creek is that the new tunnel has been run in 35 feet farther than the old tunnel, some 550 feet in all. In clearing off the bedrock, the dirt and boulders had to be hoisted up to and run out through the upper or old tunnel, which made the work proceed rather slowly. When bedrock was reached, it was found to be as smooth as glass and sloping. The first washup netted $231, and the second $154.50. The channel is widening, and the company expects to strike big pay when ground outside the canyon is reached.

SHIPMENTS.—Ore shipments continue from the Monarch mine at Field, a total of 700 tons having been sent to the company's smelter at Vancouver. The 700 tons represent a money value of $35,000. Coal from the mines at Anthracite is also beginning to go westward, a few carloads arriving daily at Donald, whence it is forwarded to Port Moody for transhipment to San Francisco.

COLORADO.

TO BE BETTER.—Elk Mountain *Pilot*, Jan. 19: It seems to be in the air that mining is going to be better the coming summer than it has been for the last two or three years. Parties whom we talk with that have recently been in the East say that capital seems to have more confidence in mining than ever before, and that there will be greater inquiry for property with true merit than ever before. This is very encouraging news for localities like ours, where it requires capital to put the mines on a paying basis.

ORE.—The finest specimen of ore we have seen on exhibition for a long time came from A. B. Williamson's Keystone mine, between here and Irwin. It is a solid chunk of lead ore weighing about 130 pounds, containing some antimonial silver, and is no doubt a fair average of the ore in the vein, which Mr. Williamson says is 16 feet wide.

DAKOTA.

REDUCTION WORKS.—Deadwood *Pioneer*, Jan. 15: The reduction works began on Friday running night shifts. The works will continue from this on running night and day. The day shift will be under supervision of the superintendent, Mr. R. D. Clark, and the night shifts under that of Mr. Harry Clark, the assistant superintendent. The crushing-mill, including the rock-breakers and rolls, now runs smoothly and at its full capacity, crushing from 60 to 70 tons of ore per day. The system of pumps which will circulate the leaching liquors are in place and ready for instant use. The leaching vats have been fitted with the false bottoms and faucets and are ready for the charges of roasted ore. But one thing is lacking, the hoppers for the roaster were ordered from Fremont some weeks ago but have not yet arrived. When put in place the mill will be absolutely complete from one end to the other and ready for the charging of the roasting furnaces. Operations will then begin at once.

IDAHO.

LEASED.—Idaho *Avalanche*, Jan. 15: Mr. John Lamb, we understand, has leased the Golden Chariot and Minnesota mines, and has gone to work on the same, assisted by a force of miners who know something about the rich chutes of ore in those mines, and who will extract the ore therefrom as soon as possible. There is no doubt that there are places in those mines that will pay well.

UPPER HOT SPRINGS.—Ketchum *Keystone*, Jan. 17: Some valuable mining claims are being brought to light in the vicinity of the Upper Hot Springs, about ten miles from Ketchum, on the road leading to the Smoky district. The formation is very favorable for mineral, being a contact between limestone and granite. The ore is galena and carbonate in character, and of a good grade. About a mile and a half in a westerly direction from the Warm Springs some three or four claims have been located upon what is known as "Warrior Hill." The Warrior No. 1 has a well-defined ledge and has been explored by tunnels at different levels on the ledge, a distance of 300 or 400 feet, exposing high-grade carbonate and galena ore. A considerable quantity of ore was shipped from this mine the past season with satisfactory results. Warrior No. 2 is a continuation, no doubt, of the Warrior No. 1 ledge, carrying the same character of ore, and showing a fine outcrop upon the surface. The mining outlook on "Warrior Hill" is very encouraging.

STRIKE.—We are informed by parties over from Custer that there has been a rich strike made in the Fourth of July mine at Bonanza. The ore is sulphuret of silver, and assays it is said $1000 per ton. Some fine ore has been encountered lately in the workings of the Southern Belle claim, on Trail creek, about a mile from town.

SAWTOOTH.—From parties who came down from Sawtooth on Thursday the *Keystone* learns that the Cornish pump at the Silver King mine has been repaired and the machinery generally is again working in good order. It is also reported that a fine development has been made in the lower level of the mine.

MONTANA.

THE LOWLAND DISTRICT.—*Inter-Mountain*, Jan. 19: Not much has been said in the papers recently about the Lowland district, but some 50 to 75 men have been busy as bees all winter there. Andrew Nelson, superintendent of the Ruby mine, was in the city last evening, and from him a reporter learned that considerable work is being done on the Ruby. There are at present 12 men at work on the mine, and four additional miners will be put on to-day. The drift east on the 50-foot level has been run 80 feet, and the drift west on the same level is in 50 feet. Stoping is being done in both drifts, and some very good ore is being taken out. Forty tons of ore per week is being shipped from this mine to various mills, but most of it coming to Butte. The Kit Carson mine, belonging to Gov. Hauser, is being worked and very rich ore is being shipped. The Carson has been a paying property for five years. Otto Moldenhauer owns the Quitzow, just north of the Ruby, and has run a tunnel on it to a depth of 125 feet. He has a vein from two to five feet in width, with low-grade ore assaying from 15 to 25 ounces in silver. Other prospects in the neighborhood on which from one to three men are working are the Mary Ann, Black Bear, Hamburg, Morton, Wolfstone, St. Louis, Blue Eye and Silver Arrow. All of these except the Wolfstone are owned in Butte.

ANACONDA.—*Review*, Jan. 19: There has been considerable activity in mining circles west of Anaconda the past two weeks, which has assumed important proportions, the principal event being the incorporation of the Red Lion Mining Co. It was decided to at once put up a 15-ton mill for milling gold ore. The mine is located about five miles northwest of Georgetown on a line between the Cable and Granite, on what is known as Cable or Iron mountain. Salton Cameron, while representing some claims near the old Stewart mill, just west of Silver lake, struck a very fine ledge of ore which gives great promise. He is now at work on this claim taking out ore and sacking it for shipment. We learn of a very important strike in the Southern Cross mine, on the 250-foot level, which has made the holders of that stock quite jubilant. We learn that development work on the Antelope mine in Oleson gulch has been successful in uncovering a very fine body of ore. There are a number of other parties at work on mines in this vicinity, and it is probable that as soon as warm weather sets in we will learn of still further important strikes in this section which is bound to come to the front.

THE CARRIE.—*Inter-Mountain*, Jan. 12: A strike was made in the Carrie mine, located near P. A. Largey's residence, a few days ago, which promises handsome returns. The strike is made in the drift west from the shaft, at the 100-foot level. The vein shows three feet of ore which will mill between 50 and 70 ounces in silver and from five to ten dollars in gold. The strike has been opened up for 208 feet and a drift is being run below the strike. A quantity of the ore has been milled at the Butte Sampling Works and shows about what is stated above, though the assays are very much higher. About 20 tons of ore a day are being hoisted now, and stoping has just commenced. The Carrie is owned by P. A. Largey, and is under bond and lease at a handsome figure to Messrs. Hornbrook, Deitrick, Cunningham, Lynch, and Christiansen.

AT BEAR GULCH.—*Inter-Mountain*, Jan. 17: Mr. R. B. Loomis of Bear gulch, in Deer Lodge county, came up to day to Butte. He reports but little mining being done in that section this winter; the placer mining being prevented by cold weather. He himself and a few others are doing a little washing in a rather primitive way, during the winter, but not more than a half dozen men are employed. There are several placers belonging to Leshau and Elfritz, James Halford & Co., Patrick Brogan and the Abascal estate, which paid well all last summer and apparently have work ahead for several years. Beartown is one of the oldest mining camps in the Territory. There have been from time to time quartz discoveries in the gulch, but capital seems slow in coming in. The owners have confidence in their properties, however, and continue development.

THE PYRENEES.—The Pyrenees mine, owned by Butte people and located at Georgetown, is running full blast this winter. The shaft is now down to the 300, and drifting has begun from that point. The mill and the two new Frue vanners which the company has put in are running constantly on ore taken from the upper levels of the mine. Twice a week shipments of concentrates are made to the Colorado smelter in this city.

NEW MEXICO.

THE KEYSTONE MINE.—Kingston *Shaft*, Jan. 12: W. George Wearing, M. E. and manager of the Flagler Reduction Works at Silver City, during his visit here last week went over to the North Percha, and among other mines in that section went through the Keystone, and was very well pleased with the outlook of the mine. He remarked that he had never seen so fine a showing anywhere during his experience at the same stage of development. A walk into drift No. 3 on the 150-foot level makes one feel as though in a silver vault. The breast of ore which is nearly four feet in width sparkles with native silver. The ore taken from this drift, drift No. 3 on the 150-foot level, for its entire length will mill 200 ounces to the ton. The average width of this chute from the time it was struck to the present time has been from 20 inches to 4 feet. It is more than probable that reduction works will soon be erected at this mine, which will be a great benefit to the camp in general and a source of steady profit to the owners of the Keystone.

GOLD HILL.—Silver City *Enterprise*, Jan. 15: W. C. Tonkin, manager of the Ruby Silver Mining Co. of Gold Hill, is now in Kansas City to make final arrangements for erecting a mill at the mine. The recent shipment of ore to Socorro ran: First-class, 571 ounces; second-class, 136 ounces. The Ruby Silver produces about the best average grade of ore in this section, and has a sufficient amount of it in sight to justify the erection of a plant. While the mill is being erected extensive development work will be done in the mine.

PINOS ALTOS.—The Golden Giant is now under lease to Jo Williams, one of the owners. Considerable time has been spent in putting the mine in order, and now that this has been accomplished this claim will again add its product to the monthly output. The Esperanza, the southern extension of the Giant, is showing up well. Free gold is visible in places, and the ore looks as if it would mill at the rate of $25 per ton.

OREGON.

ANOTHER MINING DEAL.—The *Democrat* mentioned at various times during the past summer that a discovery of gold had been made at McCord gulch in Pocahontas district in an earthy formation of clay substance, something never before known in this country. One gentleman, who seemed to be more familiar with the formation than any one else, pronounced it similar to the wonderful Australian reefs, from which gold had been extracted in immense quantities. The Pocahontas property was located by Edward Hardy and others of this city, and repeated experiments made by them resulted in wonderfully rich gold prospects and encouraged them in the belief that they owned a mine. Yesterday County Clerk E. H. Mix received from New York papers to be placed on record by which the Big Aleck mining property is sold, transferred and conveyed for the sum of $150,000 and other provisions to the effect that a large mill is to be erected at an early day on the property. This sale will be the means of putting considerable money in circulation in Baker City, for the new company will operate on an extensive scale. The mine is situated only about six miles west of the city.

A $70,000 CLEANUP.—Bedrock *Democrat*, Jan. 15: We understand that the cleanup of the C. T. Bradley Mining Company, at Sanger, for the month of December amounted to $70,000, the largest monthly output ever obtained from this mine. This is simply an illustration of what a good mine under able management will do. It will be a glorious day for Baker county when many more of the valuable mines are placed under like management. This done and hundreds of properties will be turning out their $70,000 monthly.

COPPER MINES.—Messrs. Hager, Hand and Connor, of whom the *Democrat* made mention several days ago as having gone to the head of Goose creek to examine copper indications there, have returned, and it is understood they are very favorably impressed with the prospects and intend letting a contract for considerable development.

UTAH.

OZOKERITE.—Salt Lake *Tribune*, Jan. 17: The Ozokerite M. Co., a New York organization, opened some mines in Pleasant Valley Junction some four or five years ago and spent much money in securing claims and opening them. R. J. Kroupa, the present general superintendent, visited all the mineral wax mines and factories in Europe and then came to Pleasant Valley and took charge of the property belonging to the company. Under his administration the company has spent about $35,000 in development the past two years. He has 13 varieties of ozokerite, found on claims owned by his company. These run from samples soft like wax to blocks almost like flint, and varying much in percentage of paraffine. Open cuts 100 feet long and shafts 50 feet deep have been made in various places and hoisting machinery put in. The first carload of ozokerite was lately shipped to New York. Mr. Kroupa exhibits mineral wax from Russia, adhering each side of rock salt, and compares it with wax from their mines where it was bordered with gypsum instead of salt, and looks just like the Russia article, said to be the best ever found. The Co. have a factory in New York, where they turn out immense quantities of waxed papers for wrapping perishable goods.

LEASERS.—*Park Record*, Jan. 18: The Woodside leasers have increased their shipments to about 100 tons daily, and the new 180-foot tunnel will be finished in a couple of days. Dividend No. 23 on Daly stock for January has been declared, payable on the 30th inst. It is of 25 cents a share, aggregates $37,500 and makes the total of Daly dividends to date, $900,000, and all paid within two years. The Sampson reorganization is practically effected. The new company, the Alliance, will start with a capital stock of $100,000, and subscriptions will be called in and the money put up for pushing developments at the mine with the opening of spring. D. F. Condon has resumed developments on his Creole property just west of the lower part of town. Work is being done in the lower or east tunnel and it is now in toward the ledge about 60 feet. The first of the week John Anderson, Chas. Robertson, Elias Erickson and Chas. Johnson obtained a six months' lease on Andrew Lundin's half interest in the North Pole claim, adjoining the Woodside leasers' bonanza. The leasers have commenced sinking a shaft.

ORE AND BULLION SHIPMENTS.—During the week the Mackintosh sampler received 1,074,890 pounds of Woodside leasers' ore; 362,100 of Ontario, and 74,970 of Daly ore; total, 1,511,960 pounds. The Crescent has just resumed ore shipments. For the week just ended the Ontario shipped 35 bars of bullion, containing 18,891.14 fine ounces of silver.

STOCKTON.—Salt Lake *Tribune*, Jan. 15: S. M. Bennett of Stockton came to the city last evening and reports matters moving along finely in that camp. At the Calumet a large body of fine galena ore has been struck in the past few days, on a lower level. On the Central, being operated by Mr. Bennett, a new vein of ore was tapped a few days ago. It shows over two feet of fine ore and has been cut six feet in length. The vein is four feet wide and has been improving much in appearance lately as development is pushed forward.

TUNNEL.—The General Connor tunnel, at Stockton, was in 657 feet yesterday, and is being pushed ahead at the rate of two feet per day. It will crosscut, at right angles, six veins in the group of six mines. This tunnel is 4½x6½ feet, and is being driven, under contract, at $5 per foot, and the contractors are making above wages.

MECHANICAL PROGRESS.

Iron Fiber—Bending and Breaking.

When we wish to break a bar of iron, we usually cut a channel with a cold chisel around the entire bar at the point where the break is desired. This having been done, we place the bar on an anvil with the channel slightly over its edge. A smart blow on the outlying portion will cause a fracture, which, at first sight, has all the appearance of crystallization. Now, if we take this same bar and cut a channel on one side, and subject it to the same treatment with the channeled face up, the crystalline appearance will show slightly, in close proximity to the bottom of the channel, but the main body of the bar will be bent and partly broken, displaying a fiber with a long, silky appearance.

Again, if we take this bar with no previous preparation and subject it to the same treatment, we shall find that, instead of breaking, it will simply bend, showing no fracture whatever. The question arises why, with the same blow, do these different specimens of iron show such widely different results? It has been said that the blow on the cold chisel disturbed the fiber of the iron, weakening it and putting it in condition to fracture at the point cut. Being desirous of demonstrating this matter and for reasons given below, we obtained a bar of iron 1¼ in. wide and ⅜ in. thick. Instead of using a cold chisel, we made use of file, and put a channel around the entire bar. We then placed the bar on an anvil, with the channel slightly over the edge, struck the outlying portion a smart blow, and it flew from the bar like cast iron. The fracture presented a crystalline appearance. This experiment satisfied us that something other than the disturbance of the fiber by the cold chisel was the cause of this sudden disruption and consequent crystalline appearance.

Some have argued that when the original skin of the iron was broken or cut, the strength was greatly reduced, and that fracture in bending was well-nigh certain.

To settle this theory, we cut again a channel around the bar, and put it upon a planer and planed away the surface for some distance each side of the channel, until the channel was entirely "planed out." The bar was reduced in thickness nearly one-third, but the "original skin" of the iron was gone. We next subjected this to the same treatment as described above, and it bent beautifully, with no indication of fracture. This demonstrated to our satisfaction that the "original skin" of the iron was not, in this kind of strain, what saved iron from fracture. (It should be stated here that iron of good quality has been broken with an apparent crystalline fracture, where no channeling or previous preparation has been made—see Kirkaldy's experiments on wrought iron and steel—but the circumstances were different from those under discussion here.) When we bend a bar of iron slowly, the fibers on the convex or outer surface of the bend are disturbed very greatly, comparatively, and this distention or elongation of fiber decreases as approach is made to the other side of the bar, where a crumbling of the surface fiber will take place.

From a careful examination of the bent portion, the different layers of fibers, so to speak, appear to have slipped or slid one over the other, to an extent depending upon the degree of strain brought to bear upon each. Sections cut from the bent portion, when examined with a microscope, show more or less distinctly that the laminæ and iron threads have become disturbed and loosened in their cinder envelopes, particularly on the outer side of the bend. If the bending is repeated back and forth several times, the loosening up of the fiber is distinctly seen without the aid of a glass.

Having briefly considered the action of iron fiber in the process of bending, we return to the question of fracture. Why does the bar break suddenly and with a crystalline appearance under a smart blow, at the point marked or channeled with a file? When a bar of iron is bent, the other fibers receive the strain first, breaking its severity as it is transmitted to those underlying. The disturbing force is distributed over the entire portion of the elongated fiber, diminishing each way from the point of greatest strain. Now it will be seen that by cutting a channel through the outer layer of fiber, the strain is confined to the point where the channel is cut. The fiber on either side to the depth of the channel is not acted upon at all, and exerts no influence as a protection to the underlying layers of fiber; hence, when the blow is received, the effect is confined to the channel, the fiber having little or no opportunity to protect itself, and it breaks short off. When a channel was cut in the bar on both sides, and then planed out, the bar was virtually restored to its normal condition, and its behavior was the same as when in its original condition.

Had we space, allusion might be made to inferior qualities of iron where, in piling, the center portions are very poor indeed, while the outside bars are of unexceptionally good quality. This kind of iron presents a good surface, but in bending and breaking, its inferior quality is readily discovered. But the experiments which we made were with good bar iron.—*From a Sibley College lecture by J. M. Allen.*

Grinding and Polishing Edged Tools.

Quite a number of men are employed in the grinding and polishing of all kinds of edged tools, such as razors, knives, axes, hatchets, scissors, etc., says the Philadelphia *Call*. These are in addition to small corps of itinerant grinders who carry with them their own foot-power machine, and who, for a small stipend, put in good shape the tools necessary for housekeepers in making hash, or butchers in making sausage or scrapple.

In a regular grinding establishment the stones used are of various kinds. Those used for the coarser work come from New Castle, Del. For a still finer grade of work an imported stone—from England—is put into operation. The finest stones in use in this business are those imported from France, and these are used in grinding the better grade of tools. For the polishing there are different grades of emery-wheels. These are made from circular pieces of wood upon the rim of which a preparation of emery dust and glue is placed, of fine or coarse quality, as may be desired.

In some of the places where this work is done extensively, there are three branches, the rough grinding, the grinding, and the polishing, and of these three the first is the hardest and the poorest paid. It is wet and very laborious work, but this work is done only where the tools are heavy and large. This is followed by grinding on the finer stone, and then comes the polishing, which is done on either fine or coarse wheels, as the tool may require. When this is done they are ready for their work of cutting or shaving, as the case may be.

There are 22 firms in Philadelphia who do this work, and they employ from two to seven men each. A practical man will do this work out and out, and when it is done by the week the wages range from $13 to $17. Where it is done by the piece, which is the case in some places, the men will earn from $14 to $19 a week when busy. Where rough grinders are employed some of the men work as low as $7, and from this up to $10. With the wandering grinders, whose shops are carried upon their backs, and whose advertisement is a bell, the wages are, as the old darky said about the white man, "mighty onsartin." Some days they may do what they call well, and earn $3 or $4, but, as a rule, they will not run above $12 a week on an average.

There has been no material change in the wages paid grinders for some years. Apprentices are taken on in some of the places to learn this trade, although there are no set rules to govern them. In some of the shops they serve three years, and in others four, and the wages while learning run from $2.50 to $6 a week. Child and convict labor are both unknown in this business.

CAUSE OF THE SUPERIORITY OF AMERICAN PLATE IRON.—Mr. Koch, in an address before the Society of Engineers of Western Pennsylvania, stated that he believed the reason why American plate was so much better than English was because it was rolled in both directions at the same heat, and as a consequence the tensile strength of a cross-section of our steel was almost the same as a longitudinal one, while the English plates showed a great difference that way, the cross-sections not being able to stand anything near so much as the longitudinal when put to the test.

FRACTURE AND CRYSTALLIZATION OF IRON.—Iron when fractured suddenly produces a crystalline fracture; but if gradually, a fibrous fracture. This accounts for the anomaly in the supposed change of iron from a fibrous to a crystalline character. Sudden shoulders which prevent a regular elongation of fiber cause a sudden snap.—*Ex.*

THE INVENTOR'S CONSENT to or allowance of the public use or sale of his invention is not requisite to invalidate a patent. The period of two years' public use or sale is to be reckoned from the date when the application is filed in the Patent Office, and not from the date of its execution.

LOCATING A NUMBER OF CLAIMS.—In view of the fact that in many localities the development of mines and other industries is retarded and paralyzed by the common custom of miners locating a large number of claims which they cannot improve or develop, but thus bar the way against those who might be able and willing to benefit the whole region by bringing to production some one of the many claims, and thus bring the camp into prominence and turn a tide of business into its borders, it might be well for the miners in each district to limit the number of claims one party or company should hold without security.—*Homer Mining Index.*

NEW MINING DISTRICT.—A dispatch from San Diego dated January 18th says: The *Sun* says this evening that a party of six will start overland this week provided with a camping outfit for the Black Metal mining district, 40 miles south and west of Needles. H. S. Hall, who has a ranch in the Poway Valley near this city, will lead the party. He has just returned from a prospecting trip there, where he staked out two claims in the Chimhuwa valley. It is a new district, and gives signs of being rich in silver ore. Hall thinks there will be a big rush for the region as soon as people hear of it.

SCIENTIFIC PROGRESS.

The Origin of Petroleum.

In a paper read before the New York Academy of Sciences, on November 26th, Professor J. S. Newberry gave his views as to the origin of petroleum as follows:

The origin of petroleum has been a vexed question, chemists holding one theory and geologists another. The eminent chemist, Mendeljeff, supposes it to be formed from inorganic elements by natural synthesis, but Mandeljeff had no personal acquaintance with our great American oil-fields. His theory is a theory only. In volcanic and metamorphic regions the inorganic elements exist abundantly and in juxtaposition, but oil is never found there, thus refuting the theory.

The geologist finds that oil is always associated with bituminous shales or limestones. Near the outcrop of the carbonaceous shales which underlie Western New York and Pennsylvania, oil and gas springs are found associated in position, and evidently so in origin. South of Cleveland, Ohio, oil and gas are found above such shales. They seem to originate in these shales, and are formed from organic matter, which goes on decaying. Coal, if left out in the open air, loses its volatile matter in the same way that these bituminous shales are doing. Thus spontaneous distillation is constantly going on, and petroleum and gas are issuing from decomposing organic matter. Petroleum, decomposing in its turn, throws off volatile gases, leaving tar, asphalt, ozocerite, albertite, grahamite (asphaltic coal), asphaltic anthracite, and as the last term of the series graphite, from which all volatile matter has escaped. The transition from oil to asphalt is very well seen in Canada, also in the Pitch Lake of Trinidad, which is fluid in the center and gradually solidifies toward the edges. At Canajoharie, petroleum oozing from the Utica black shales in ancient times has formed seams of anthracite from the thickness of a sheet of paper to those several inches thick. At a mine in Idaho eruptive rocks have formed dykes in carbonaceous (cambrian) shales, and fissures are filled with anthracite, also a residue from ancient petroleum. In the Laramie rocks of Northwestern Colorado are veins of albertite 10 to 20 feet thick, resulting from petroleum which came from the Colorado shales below.

All these examples indicate the methods of operation of natural agencies through secular periods. But similar processes are even now going on. We may see on a small scale the formation of oil in pools where vegetation is decaying. In such places, remote from the great oil-fields, a thin film of oil is formed on the surface of the water, and on poking up the mud with a stick, bubbles of marsh gas are set free from the bottom.

All these phenomena point clearly to vegetable tissue as the origin of the various hydrocarbons, whether gaseous, liquid or solid. Some small proportion may be of animal origin, as adipocere is not infrequently cast up by the sea, but the great deposits must be of vegetable origin. This is confirmed by microscopic examination of bituminous shales, which are found to be full of broken vegetable fibers. A possible source of oil and gas are the minute algæ, such as now in summer abound in some lakes to such an extent as to render the water green and opaque.

These considerations throw light on the question of permanence or failure of supply in gas and oil wells. If the theory of the speaker is correct, first, gas and oil springs and wells must be confined to strata overlying beds of organic matter, such as coal, carbonaceous shales and bituminous limestone; second, gas and oil will flow from such deposits as long as any organic matter is left; third, the daily flow of gas and oil will be small, and great accumulations of either can only take place where fissures or coarse, porous rocks serve as a reservoir, and impervious strata above prevent escape and cause the accumulation of hundreds of years of daily product. Hence gas and oil wells will continue to flow for ages, but when the stocks in reservoirs are exhausted, or the current production is divided among many wells, the product may be so reduced as to be of little or no value.

The oil wells of Mecca, Ohio, prove the continual formation of petroleum. These wells are bored in the Berea grit, a sandstone which overlies the Cleveland shale, a sheet of carbonaceous matter. When first opened the Berea grit was found saturated with oil, and several hundred wells were bored in close proximity. These soon drained away the accumulation of oil, and within three months every well was supposed to be exhausted and was abandoned. Now a small but remunerative industry is maintained there by pumping each well a few days in the year. The quantity taken from each, though small, is constant, proving a continued production. As no oil has been obtained there below the Cleveland shale, and gas and oil are seen escaping from that in a multitude of places, we must conclude that they come from the shale.

History confirms this view of permanency in supply. The Chinese have used petroleum for 2000 years and the Hindoos for many hundreds, and the spontaneous flow upon which they have depended has been constant. On the shores of the Caspian, enormous and apparently constant quantities of gas and petroleum have escaped from the ground from time immemorial. The Babylonian asphalt used as a mortar is a petroleum product furnished by the fountains of Hit, which are apparently flowing now as they did thousands of years ago. In all these localities the spontaneous outflow of oil (that is, the daily product of subterranean distillation) has been used, and such sources of supply are permanent, but the steam pump will certainly exhaust local reservoirs of oil, and numerous gas wells will exhaust a territory, however productive in the beginning.

In discussing the paper, Mr. Hidden took issue with the theory of the vegetable origin of petroleum, adducing the fact that carbon from meteorites has been distilled and oil obtained, and that quartz and granite are found sometimes heavily charged with carbonic acid, either gaseous or sometimes even in a liquid condition.

Prof. Newberry replied that the granites which contain carbonic acid and graphite are sedimentary rocks which have been metamorphosed by heat, and their organic hydrocarbons distilled. He had only attempted to explain the origin of the petroleum of this world; we do not know anything about the conditions of things in worlds other than our own, but analogy justifies the inference that similar causes produce similar effects elsewhere as here.

DANGEROUS EXPANSIONS OF ICE.—An interesting communication lately appeared in the *Engineering and Building Record* in regard to the expansion of ice by heat, which explains a good many phenomena that most people have observed without being able to account for them. According to the letter, a short railway was once built in the province of Ontario, which crossed a fresh-water pond known as Rice lake, by a bridge 2½ miles long. The bridge was mostly composed of trestle-work, very strongly built, with uprights driven to hard bottom and thoroughly braced. The middle portion, over the deepest part of the lake, was composed of trusses, 80 feet in span, supported by piers measuring 12 by 24 feet and filled with stones. Early in the first winter after the bridge was built, the lake froze over to a depth of about seven inches. Before snow came to protect the ice the weather moderated, the sun shone brightly, the ice expanded, and in a few minutes the bridge was in ruins nearly its whole length, the trestles being pushed over in the direction of the principal expansion. The destruction of the bridge caused the temporary abandonment of the railway, but years afterward, the trestles were repaired and filled in with an embankment of gravel, the top of which is eight feet above the level of the water; yet the expansion of the ice during the sunny days is so great that it frequently creeps up the embankment, and, by successive movements, is pushed upon the rails.

PURIFYING WATERS.—A valuable discovery of the efficacy of alum as a cleanser of noxious water was made by Professor Leeds in the course of an investigation of an outbreak of typhoid fever at Mount Holly, N. Y. He found the water supplied to the inhabitants of that place swarming with bacteria, and added half a grain of alum to a gallon of the dangerous fluid. The result was that all the dirt and coloring matter was precipitated and nearly all the bacteria destroyed. The bacteria that were left were all of large forms and were easily removed by filtering the water through two thicknesses of filtering paper. The simplicity of this means places it within the reach of every one, and it ought to be widely known.

HEREDITY OF FACIAL EXPRESSION.—It is considered an interesting fact that all the women of Cyprus, except the most decidedly ugly ones, have the same contour to the nose which has existed among the women of that island from the earliest historic times—600 to 1000 years before the Christian era. This form of the nose and general facial expression is impressed on the marble of the Venus Aphrodite found by Gen. Di Cesnola among the ruins of an ancient temple on that island.

A NEW GAS PROCESS BY A LADY.—T. G. Hall, D. H. Fletcher, and Miss Hattie Proctor of Chicago, were at Lima, Ohio, last week, experimenting with a machine, of which Miss Proctor is the inventor, for making illuminating gas out of crude oil. The process is a new one, and promises to change the fuel of the country entirely. It is claimed that by Miss Proctor's machine 10,000,000 cubic feet of gas can be made from one barrel of crude oil.

A CURIOUS SPRING.—Near the soda springs of Ashland, Ogn., there is a spring which emits gas so poisonous as to kill whatever may breathe it, and it is said that there is almost constantly a ring of birds, snakes, lizards, and small deer lying dead about it. The same deadliness is claimed for a spring somewhere in Idaho, and in both it is thought that a concentrated form of carbonic acid gas is the active agent of destruction.

AURORAL DISPLAYS.—Dr. de la Rue has reached the conclusion, after numerous experiments, that the most brilliant displays of the aurora borealis occur at an elevation of not more than 38 miles, while a pale glow may possibly be produced as high as 82 miles, but that no auroral discharge is possible at a hight of 124 miles.

STATIC ELECTRICITY, such as is produced by friction of belts, has a very injurious effect on incandescent lamps, placed near enough to the belts to be affected by the charge. The static effect ruins the vacuum.

GOOD HEALTH.

Cancer Quackery.

The following article from the pen of Joseph R. Buchanan, M. D., was recently written for the *American Spectator*, and has appeared in several other journals of repute. We reproduce it as fully confirmatory of the position we have taken in these columns in regard to the treatment and curability of cancer. The authorities introduced are of the highest standing in the allopathic school of medicine and practice. Dr. Buchanan himself is a well-known writer and medical practitioner in Boston. He is president of the College of Therapeutics of Boston; author of "A System of Anthropology;" "The New Education," etc., etc., and editor of the *Journal of Man*. The article, although somewhat lengthy, should be read by every one who takes any interest in the present general discussion in relation to the treatment of the one dread disease, which, above all others, baffles the skill of the regular faculty. We condense and curtail somewhat to bring it within the scope of our columns:

The Curability of Cancer.

It is a well-established fact, of which there are many living witnesses accessible to the public, that cancer can be, has been, and is being, cured without the use of the knife, by measures which the old allopathic colleges and their obedient graduates do not sanction and will not investigate. The witnesses have been called before legislative committees, the facts have been extensively published, and no honest inquirer who is not identified with medical monopoly can have any doubt of the curability of cancer after examining the evidences.

Although the allopathic party know they do not or cannot cure cancer, they spare no pains to shield their incompetence by overwhelming with odium all who do not join with them in saying the cancer patient is incurable, and especially all who have had the audacity to cure them without permission.

Notwithstanding the general theory of the allopathic party that cancer is incurable, there are not a few who persist in that desperate experiment on human life, which consists in applying the knife to cancers of the breast, and this is what we mean in speaking of *cancer quackery*.

Cancer Quackery.

What is quackery but an ostentatious pretension to do something which the party cannot do and which results in large fees to the operator, but anguish and death to his subject. Plunging the knife into the female breast is, in the great majority of cases, a heartless and *cruel quackery*, made doubly censurable by the fact that he who thus trifles with human life is, in the majority of cases, ready to denounce, with malignant energy, the physician who, *without using the knife*, restores the hopeless patient to health and prolonged life. There seems to be no greater crime in allopathic *medical ethics* than depriving an allopathic doctor of his fees by curing his patient.

These remarks are not, of course, applicable to all cancer surgeons, for some small cancers of the lip are sometimes successfully cut out; but they are especially applicable to those who fight against the medical cure of cancer, and who would prosecute or punish the *curer* of cancers as a criminal. Dr. Robert Morris, for example, writing in the *Popular Science Monthly*, calls cancer-curing an "illicit practice," but has nothing to say against cancer-*killing*, for which, in fact, he asked the protection of the law.

Allopaths Denouncing the Use of the Knife in Cancer.

To show that cancer-cutting on the female breast is the most cruel and daring quackery practiced at the present time, it will be sufficient to quote the testimony of the most eminent surgeons who have spoken out honestly on this subject.

There is no higher authority on this subject than Sir James Paget, the surgeon of St. Bartholomew's hospital, who said in 1870 that "in deciding for or against the removal of a cancerous breast in any single case, we may *dismiss all hope* that the operation will be a final remedy for the disease. I will not say such a thing is impossible, but it is so highly improbable that a hope of its occurring, in any single case, cannot be reasonably entertained."

There is other authority amply sufficient to place this statement beyond doubt. Surgeon John McFarlane of Glasgow in an able paper published fifty years ago, said of his own practice, in reference to cancer of the breast, "of thirty-two cases operated on by myself, in which the carcinomatous nature of the disease was distinctly ascertained, the *cure was not permanent in a single instance*." He also reported *eighty-six other cases* operated on by his friends, who extirpated the breast for cancer *without effecting a cure in a single case!*

Such has been the experience of prudent physicians alike in ancient and modern times. Hippocrates objected to operations for cancer. So did Alexander Monroe of Scotland, and so did the late Dr. Kearney Rodgers of New York, after he had had a terrible experience. It is said of him that "though he had removed a bushel basket of cancerous breasts, he had determined never to perform the operation again."

Dr. Mason Warren of Boston, after removing a cancerous breast, said to Dr. Wyman that he wished he never should hear anything more from it as long as he lived.

Dieffenbach, the celebrated German surgeon, was forced to the same conclusion, and said that the greater his experience became, the more he was disposed to renounce every operation for cancer of the breast. He further said that surgeons who for many years have operated on cancerous tumors, struck by their frequent recurrence, have at various periods completely abandoned the operation. These things he said in a letter to the distinguished French pathologist, Lebert, who expressed a similar opinion that the palliative "method of treating cancer of the breast ought to be the rule, and by operation the exception."

Dr. J. C. Warren of Boston stated in the Medical Society, November 12, 1888, that one year ago he operated for cancer in the breast, "on the theory that I might be able to remove all the disease, and when I got through the operation I felt satisfied that I had removed all visible disease, and yet that patient died with very extensive and malignant return in all parts of the body."

After alluding to one or two other cases similar to the above, the writer, after tendering thanks for this array of facts, asks these physicians why they cannot extend their candor and honesty a little further, and after admitting their own failures, look at some of the cases near by, cured without the knife, and tell the public the truth instead of sneering at those who are successful. The writer then continues:

If there are any cancer quacks in the field, the cancer surgeons who wield the knife belong to that class, even by their own confessions; for with all these disastrous failures before them, and the solemn verdict of experience against the operation, the champions of knife-quackery are advancing to a still more daring and dangerous policy—the policy of not only extirpating the cancerous breast, but cutting away all the glands under the arm on *suspicion of contamination*, and even portions of the muscles, thus making it one of those *bloody and terrible operations* which are frequently *fatal on the spot*. This theory of killing the patient outright for the *remote possibility*, against all science, of producing some ultimate benefit, is the most flagrant example of *bloody quackery* in the history of medicine. It is quackery, because it is unsuccessful. It is quackery because it is a fraud upon the patient, who is made to believe that his only hope is the knife, and that the cures are fictitious.

Patients Are Deceived.

There is so much credulity in the world, and so much ignorance on medical subjects, that it is not strange if even intelligent patients are deceived by the unanimous misstatements of the colleges and their graduates.

But why, we may ask, on what ground is this terrible operation proposed, and patients induced to submit to it? Frankly and plainly on the ground that the common extirpation of the breast *is a failure*, and therefore a still more terrible operation must be performed if anything is done. Here are two operations proposed—one dangerous and the other *more dangerous*, and the partisans of each say *the other is a failure*. Would any intelligent patient submit if the whole case were fairly stated? Would there ever be another of these bloody, unscientific operations, if all patients were duly informed of the success of cures effected without the knife? Certainly not—*the patient is always deceived.*

Cutting Does Not Prolong Life.

The very advocate of this most bloody practice, Mr. Banks, writing in the *British Medical Journal*, has the candor to say: "The popular idea that operating prolongs life is quite wrong. I believe it to be a *perfect delusion*. I believe that all these patients would have lived longer if they had never been touched. Yet you hear the operation being constantly advised on the ground that if it do not cure the patient, it will give her a little longer lease of life. On the contrary, the excitement that is set up by the operation makes everything that is left behind of a malignant character grow with double and triple speed, and I am inclined to think that the deaths after reappearance *are more painful* than when the cancer has been untouched. If a surgeon do not see his way to *a clean sweep*, I can only implore him to let things alone, for in few diseases does *meddlesome interference work more mischief than in this*." And he adds that any operation which does not thoroughly cure makes the patient "*decidedly worse*," which is sanctioned by the expressed belief of Dr. John Homans of Boston, that patients lived longer without the operation than with it.

Why then encounter the danger of this CLEAN SWEEP operation? Mr. Paget believes that it does not prolong life, and Leroy d'Etiolles has given statistics of 3974 cases of cancer of all kinds, of which 1192 were not operated on, and the conclusion from these statistics is that, upon the whole, if there was any difference as to the continuance of life it was in favor of those not operated upon. What reason, then, is there to undergo an operation which *may be fatal on the spot?* With all the best appliances of modern surgery, in the clinic of Esmarch, there were *twenty-one deaths from the operation* in 261 cases. In 41 cases reported by Mr. Banks (English surgeons are simply Mr.), *six were fatal* to the patient and none were cured. Of 141 cases reported by Mr. Butlin, *twelve were killed* by the operation on the breast.

In Mr. Moore's report on this subject, it appears that of 224 cases of cancer of the breast operated on by the knife, the average length of life after the operation was but 39 months. Taking these cases just mentioned, in 443 operations *forty-one* were killed by the act of the surgeon, and it may well be asked, has a physician any moral right to *kill one patient in eleven* by a bloody operation, when the best scientific authority says the operation is neither curative nor beneficial? The truth is, this knife quackery of the old colleges on the female breast is worse than their lancet quackery, which the increasing enlightenment of the age has abolished, and in the coming century, now very near, it will hold the same rank among the barbarisms of the healing art which New England witchcraft and witch murder hold among the barbarisms of religion.

Constitutional Treatment.

We believe that nearly, if not quite all, who advocate the use of the knife deny the possibility of curing by constitutional treatment, and yet we have in this very city of San Francisco scores of living evidences that constitutional treatment has cured patients which our best physicians have pronounced cancer. There are also many cases where the surgeons have removed the cancer once and twice, and when it has come again have again advised the knife, but which has been rejected and the patient subsequently cured by constitutional treatment. But not in a single instance, though repeatedly urged to do so, have they been willing to satisfy themselves by personal examination that such cure has been effected. Why? In regard to this phase of the question our author continues:

Sir James Paget said not long ago that he believed that if ever a cure for cancer of the breast was found, it would be found in constitutional treatment, for local treatment had been pursued for 500 years without success.

What excuse then can there be for persisting in this cruel operation? The only excuse is the positive assertion made by the surgeons and imposed upon their confiding patients (the surgeons having been deceived by the colleges in their education), that there are no cancer cures and that nothing but the knife has any power. Ought not the colleges to forfeit their charters for such a dereliction of duty? [and such falsification of well-known facts.—EDS. PRESS.]

Is not this cancer business a shameful imposition upon patients, who are always deceived? The patients who have been cured without the knife are living in good health in the neighborhood of some of the surgeons, but who ever heard of an allopathic surgeon investigating or even inquiring into one of these cures? It is enough for him to know that the physician who made the cure does not belong to his sect or his society, therefore he is an outside barbarian, to be treated as the ancient heathens treated barbarians of other tribes.

Our author discusses the subject at still further length, but we must close these extracts with this simple assertion, with which we fully coincide: "This is not so much a medical question, though it does concern the progress of the healing art, as it is *the people's question*," and we may add that the people of this State will probably take up the matter in the present Legislature and endeavor to secure a competent commission to investigate the same and report thereon to the people.

USEFUL INFORMATION.

TAMING A BIRD.—No creature is more jealous or sensitive than a bird, and we know of no better way to make a bird fearless and familiar than that described by Olive Thorne Miller in the *Homemaker:* There is an easy way to win the heart of almost any bird, and without starving him or making him think he has mastered you. Simply talk to him a good deal. Place his cage near you, on your desk or work-table, and retain his choicest dainty to give him with your own fingers. Let him know that he can never have that particular thing unless he take it from you, and he will soon learn, if you are patient and do not disconcert him by fixing your eyes upon him. After this he will more readily take it from your lips; and then, when you let him out of his cage after the first excitement is over, he will come to you, especially if you have a call you have accustomed him to, and accept the dainty from you while free. As soon as he becomes really convinced that you will not hurt him or try to catch him, or interfere in any way with his liberty, he will give way to his boundless curiosity about you; he will pull your hair, pick at your eyes, and give you as much of his company as you desire.

LIGHTING DOMESTIC FIRES BY ELECTRICITY Mr. Leigh S. Powell, in the columns of the *Electrical Review*, suggests a new use for electricity, *i. e.*, to light domestic fires. He proposes to make the bars of the grate one electrode, and an iron plate let into the back part of the grate the other. Cinders and coke being themselves conductors, when the grate is filled with these and the current turned on, heat is developed at the points of contact between the pieces of fuel, these localities being those of the highest resistance. With an experimental arrangement Mr. Powell found the cost of lighting a fire to be 1½d. or 2d.—a prohibitive price—but he thinks that with a greater E. M. F. than he had at command this cost would be much reduced. Dreams of being able to light a fire by pressing a button before you get out of bed on a cold winter morning are undoubtedly pleasant.

A NEW AUTOMATIC FIRE EXTINGUISHER.—A new article has been introduced in London, called the Draper Hetherington sprinkler, which appears to have features of superiority. It is described as being doubly automatic—that is, it discharges upon the fire on prescribed conditions, and when it has accomplished its object and extinguished the fire, the room cools the action of the sprinkler, and the further discharge of water is arrested. It is moved to action at 120° Fahrenheit, or 35° lower than that required by other sprinklers, and it is brought into operation by the expansion of a volatile fluid instead of the fusion of a metallic joint, and it is by the contraction of this fluid upon the cooling of the atmosphere that the discharge of water is stopped.

GOING ABROAD FOR CHICKENS.—It is one of the inexplicable matters in California industries that we should depend so much upon imported chickens and eggs. The railroad people themselves seem to be puzzled at the fact. W. H. Mills, one of the railroad officers, in a recent conversation with a reporter, said: "Don't you know it seems funny to me to see three or four carloads of chickens and eggs from Iowa come into our freight-yards every day. There is a lesson in the fact for our farmers. California should be able to supply herself with poultry and eggs, and the man who recognizes this fact and goes intelligently to work will realize a handsome income from the business. This importing of chickens and eggs appears to me very much like carrying coals to Newcastle."

EXPERIMENTS IN ELECTRIC FISHING.—A writer in the *Fishing Gazette* says: Experiments have been tried on the Welsh Coast with the electric light in connection with fishing with nets in the sea. I am told that two nets were let down at night, one being furnished with an Edison-Swan glow lamp. That net, when raised, was full of fish; but the other, to which no lamp was attached, was almost empty. The light was then shifted to the other net; both nets were tried without lamps, and both nets with lamps. The result in all these cases went to show that the electric light attracted the fish in a most wonderful manner.

FRENCH PERFORATED MONEY.—Our people have had their laugh over the curious Chinese perforated money; but it seems that the French are about to inaugurate a similar system in their small coins. An exchange says: The French Mint will soon replace the copper sous with nickels. Singularly enough the five and ten centime pieces will be perforated in the center, after the manner of Chinese coins. This enables them to be strung and counted or handled with great ease.

VULCANIZED FIBER FOR GEAR-WHEELS.—Vulcanized fiber for mechanical purposes has for some time attracted attention. As a material for cogs, in cases where the moist air would be an inconvenience and injury to ordinary gearing, it has, according to all accounts, given very satisfactory results. In one case gutta-percha cogs are known to have been used for 20 years. When the wheels became worn, the material was utilized for casting new ones.

GENERAL INAUGURATION OF THE EIGHT-HOUR LAW.—The 1st of May, 1890, has been fixed by the American Federation of Labor, in session at St. Louis, as the date for a general inauguration of the eight-hour rule in the United States. This is one of those doubtful industrial systems which can never be settled by verbal discussion, and the sooner it is put into general practical operation the earlier will its merits and defects be known and appreciated.

A CURIOUS PLACE FOR AN OAK TREE.—Twenty-seven years ago, an acorn lodged somehow in the mortar or between the stones of an Ohio courthouse spire, took root, and sent out an oak shoot. To-day a miniature oak grows on the spire, 80 feet from the ground. It draws life from the cement, the "skin of the rock," and the air, but principally from the air, as there is very little cement in the spire.

FRUIT EVAPORATION IN NEW YORK.—Within a radius of 40 miles of Rochester, N. Y., there are more than 1500 fruit evaporators, giving employment during the autumn and winter to about 30,000 hands. Last season the production of these evaporators was about 30,000,000 pounds, worth at first cost about $2,000,000. A large proportion of the product is exported.

A MUSICAL ROPE.—A novelty for children in the form of a skipping-rope which plays tunes while it is being used, has been introduced. There is a small musical box fixed at the end of one of the handles of the rope, and the turning of the rope puts it at once in action.

COLORADO is becoming an oil-producing State. In the Valley of the Arkansas, near Pueblo, there are a number of wells the yield of which is 1000 barrels per day.

TABLE OF CONTENTS.

EDITORIALS.—A Practical Traction Engine; 53. Passing Events; Mining Stock Buyers and Brokers; Annual Mining Review; Effect of Foreign Patents on Life of American Patents; Electric Power at Big Bend; Artesian Wells, 56. Hauling Engines for Mines; Academy of Sciences, 57.
ILLUSTRATIONS.—The Roberts & Doan Direct-Acting Traction Engine; Geological Conditions Affecting the Flow of Artesian Wells, 53. Section of Coal Measure Cut by "Diamtless" Core Drill, 55. Hauling Engines for Mines, 57.
CORRESPONDENCE.—Montana Gold Mines, 54.
MISCELLANEOUS.—Southern Colorado Coal; Good Ore; Quicksilver in California; The Situation in Eureka District; Pine Grove; Dry Crushing and Concentrating, 54. Legislative Committees; Boring for Coal; Alaskan Placers; Waste Filling, 55.
MECHANICAL PROGRESS.—Iron Fiber—Bending and Breaking; Grinding and Polishing Edged Tools; Cause of the Superiority of American Plate Iron; Fracture and Crystallization of Iron, 58.
SCIENTIFIC PROGRESS.—The Origin of Petroleum; Dangerous Expansions of Ice; Purifying Waters; Heredity of Facial Expression; A New Gas Process by a Lady; A Curious Spring; Auroral Displays, 58.
GOOD HEALTH.—Cancer Quackery, 59.
USEFUL INFORMATION.—Taming a Bird; A New Automatic Fire Extinguisher; Lighting Domestic Fires by Electricity; Going Abroad for Chickens; Experiments in Electric Fishing; Vulcanized Fiber for Gear-Wheels; French Perforated Money; General Inauguration of the Eight-Hour Law; A Curious Place for an Oak Tree; Fruit-Evaporation in New York; A Musical Rope, 59.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 56–7.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 64.

Business Announcements.

Passing Events.

Another English company has gone into mining in Alpine county, this State. They have bought the Morning Star mine, near Monitor, and will put up a mill. Alpine has not been heard from as a bullion-producer for some time.

Some attention is again being paid to mines in Lower California, and ore is to be shipped to National City for reduction.

Conflicting reports continue to come from Harqua Hala. Some of those who have written from there speak well of the region, while others condemn it.

It is evident that there will be more development and prospecting in British Columbia during the coming season. Some of the quartz mines there make a good showing.

The English company which recently bought the Bear's Nest mine in Alaska, will send an 80-stamp mill to the mine by next steamer. Another 10-stamp mill is at work on Silver Bow basin, and an 80-stamp custom mill will be put up. A good many men will go to Alaska the coming season.

AT Spring Valley, Ill., about 2000 miners have gone out on a strike. The trouble is owing to a dispute in connection with the union.

Mining-Stock Buyers and Brokers.

On last Monday the United States Supreme Court rendered a decision of unusual importance to all dealers in stocks. The opinion, as telegraphed to this city, was rendered in the case of William G. Galigher, appellant, versus Thos. F. Jones, on appeal from the Supreme Court of Utah. The case turns upon the loss sustained by Galigher through the refusal or neglect of his broker, Jones, to follow his instructions in a stock transaction. The court holds that the broker is but an agent, and that he is bound to follow the directions of his principal or give prompt notice that he declines to continue the agency. It, therefore, decides that Jones is liable for damages for not notifying Galigher by telegraph that he would not convert certain stocks into other stocks, as he was ordered to do. The measure of damages which should be awarded where stock advances in value after an order to buy has been given, the court holds, should be the highest intermediate value which the stock attains between the time the order was given and a reasonable time after the notice of the failure to buy stock is given to the intending purchaser, in order that he may make a new order.

The decision in question has a much broader and deeper significance than is conveyed on the surface; or, at least, a number of leading stock operators in this city take that view of it. Their opinion, based on what they consider the purport of the decision, is that when a broker acting for another person buys stocks, he has no legal claim on or control of the stock further than the securing of himself against any loss for the necessary money advanced to make the purchase, and therefore he cannot jeopardize the stock either by loaning or otherwise handling it so as to risk its loss through a financial crash, unless there is a written agreement allowing the broker to hypothecate the security for the money advanced by him. It is also claimed that by this decision a broker cannot vote or allow to be voted the stock at any election held by the company that issued it, unless the consent in writing of the principal is first secured. If this latter opinion is held valid, then at all future elections of incorporated mining companies, officers cannot be elected except by the owners of the stock in person or by their agents, under a written agreement or instruction.

Annual Mining Review.

The MINING AND SCIENTIFIC PRESS for February 2d will contain a general review of the condition of mining affairs in the Pacific States and Territories, giving the product and statistics for the past year and of the features of the mining industry in 1888. The special article or review has been carefully prepared, and, while elaborate, has been so condensed as to comprise within a few pages the mining history of the year.

In order, however, to give our usual departments their full scope, the PRESS of next week will be enlarged by the addition of a number of pages and a double edition will be printed.

The MINING AND SCIENTIFIC PRESS is the oldest paper in the United States devoted to mining interests. Its annual reviews form a complete history of the mining industry for the year, useful for reference at any time, and furnish a basis for comparison not afforded in any other publication. Those interested in mining affairs can, with slight trouble, thus gain a good knowledge of the general condition of the business, and preserve the statistics for reference.

To advertisers this offers an excellent opportunity to reach special readers, since these papers are sent in all directions over a large field.

BISMUTH.—Rich deposits of bismuth have recently been discovered in North Queensland. Drs. Tarrant and Flatau of Sydney were shown some rich specimens of carbonate of this metal, which had been found at a place about 120 miles inland from Bowen. The ore, which is pure carbonate of bismuth, contains 50 to 85 per cent of metal.

THE contract for supplying 30 tons of flanged boiler-plates to the double-turreted monitor Monadnock, now at Mare island, has been awarded to the Union Iron Works, the contract price being $10,870.

Effect of Foreign Patents on Life of American Patents.

The United States patent law provides that in case an inventor takes out a foreign patent previous to the time when he takes out his U. S. patent, the latter will be limited in its term of life to the term of life of the foreign patent and will expire with that patent. Many serious questions arose out of this provision. The first was, whether, if the foreign patent lapsed before the expiration of its natural term, as would be the case upon the non-payment of annuities and taxes, the U. S. patent would expire simultaneously. This question has, however, been decided in the negative, that is to say, the U. S. patent will not expire simply because of the lapsing or unnatural expiration of the previous foreign patent, and this is now undoubtedly the law.

The next question arose out of the peculiarities of certain foreign patent laws, as, for instance, that of Canada, which, until recently, provided for a patent for five years with a privilege of extension to ten years, and another privilege of extension to 15 years. The question under such a law as this was, whether the previous foreign patent being taken out for five years, the U. S. patent would expire at the end of that term, notwithstanding that the foreign patent could be extended for a longer period. The Circuit Court of Massachusetts decided this question in the affirmative; that is, that the U. S. patent did expire at the end of the five years. This decision was appealed from to the Supreme Court of the U. S. in the case of the Bate Refrigerating Company vs. Geo. H. Hammond & Co.

The Supreme Court has now reversed the decision of the Circuit Court of Massachusetts, holding that the life of an American patent first taken out in a foreign country does not expire until the extreme limit of time for which an extension of the patent may be secured in the foreign country.

This would seem to settle the question conclusively, but in this particular case the foreign patent was, in fact, renewed. Now whether the same doctrine would apply if the patent were not in fact renewed, but the inventor simply had the privilege of so doing, is a point which has yet to be decided.

Electric-Power at Big Bend.

In the PRESS of December 22d last was an item to the effect that the electric-power plant had been removed from the Big Bend Tunnel Co.'s property, the inference being that it had proved unsatisfactory. We have since been shown a letter from the president of the Big Bend Tunnel & Mining Co., Dr. R. V. Pierce, in which he says it is incorrect to attribute the stoppage of work at Big Bend to any defect in the electric plant. "To be sure," he says, "we had a little trouble with the electric appliance at the start, but it was not so much the fault of anything in the plant as in the fact that no proper means of regulating the speed of our water-wheels had been provided. As to the plant itself, I believe it to be all that it was represented to be by the manufacturers. As soon as some regulation was applied to the water-wheels, and our men got a little familiar with the handling of the different machines, it worked most satisfactorily and furnished reliable and constant power, the motors developing considerably more power than they were rated at. The plant was taken out for the simple reason that obstacles were developed in our mining excavations which rendered it impossible for us to work the mines at a profit; therefore, we had no further use for the machinery and thought it best to take it out and dispose of it."

WHILE prospecting at Harqua Hala, the Fowler Brothers of Phœnix, A. T., are said to have found the long-lost Penhachapi gold mine. Lots of prospectors have been looking for this mine for years. The usual things connected with these re-finds are reported in this case, viz., an old shaft, tools, a skeleton of a white man, etc.

THE thirteen-weeks strike of the colliers of New South Wales involved a loss estimated at $2,500,000, mainly to shippers.

HARRY HANSON fell 82 feet in the shaft of a mine near Helena, M. T., last week, and then got up and walked off.

Artesian Wells.

The Requisite and Qualifying Conditions.

Drillers are now developing the sinking of artesian wells into a specialty, and through the aid of geological reports are mastering the stratigraphical elements of the problem in their several regions. Artesian wells form one source of pure water supply, but not always an unfailing one. This inconstant feature is an element which should lead to discussion, since they are a valuable resource in certain regions and under certain limitations, while in other regions they are only a lure to useless expenditure.

T. C. Chamberlain has contributed to the U. S. Geological Survey an article on the "Requisite and Qualifying Conditions of Artesian Wells," which is of great interest. He speaks of artesian wells as applied only to those that flow at the surface, condemning the use of the term as applied to denote deep wells not flowing. Artesian flow is but an expression of the common law of flowage made a little unusual by its special conditions. Any seeming strangeness springs from partial observation. Certain portions of the water of every stream are always "running uphill," though its average mass is moving down. The bottom layer flows up and down, according to the inequalities of the bed, while the top layer declines more uniformly with the surface slope. In the artesian stream we only see the rising column issuing from the earth and the brooklet that flows away. The more potent descending volume that forces the flow is concealed. No portion would rise if it were not forced up by a superior portion pressing down.

Fig. 1 of the cuts (see page 53) is a longitudinal section of a stream, illustrating in part its upward currents, subordinate to the general downward flowage.

To fashion a single idea of the common class of flowing wells, picture to the mind a pervious stratum through which water can readily pass. Below this let there be a water-tight bed, and let a similar one lie upon it, so that it is securely embraced between impervious layers. Suppose the edges of these layers to come to the surface or some elevated region (save that they may be covered with soil and loose surface material) while in the opposite direction they pitch down to considerable depths, and either come up to the surface again at some distance (Fig. 2) or else terminate in such a way (Fig. 3) or take on such a nature (Fig. 4) that water cannot escape in that direction. Now let rainfall and surface water penetrate the elevated edge of the porous bed and fill it to the brim. That such beds are so filled is evident by ordinary wells, which commonly find a constant supply at no great depth. Now it is manifest that if such a water-fat bed be tapped by boring at some point lower than its outcrop, the water will rise and flow to the surface, because of the higher head in the upper edge of the bed. If the surface water continually supplies the upper edge as fast as the water is drawn off below the flow will be constant.

Fig. 2 is an ideal section illustrating the chief requisite conditions of artesian wells. *A*, a porous stratum; *B* and *C*, impervious beds below and above *A*, acting as confining strata; *F*, the hight of the water level in the porous bed, *A*, or, in other words, the hight of the reservoir or fountain-head; *D* and *E*, flowing wells springing from the porous water-filled bed, *A*.

Fig. 3 is a section illustrating the thinning out of a porous water-bearing bed, *A*, inclosed between impervious beds, *B* and *C*, thus furnishing the necessary conditions for an artesian fountain, *D*.

Fig. 4 is a section illustrating the transition of a porous water-bearing bed, *A*, into a close-textured, impervious one. Being inclosed between the impervious beds, *B* and *C*, it furnishes the conditions for an artesian fountain, *D*.

Fig. 5 is a section illustrating the usual order in which the strata of a basin come to the surface; *A* and *B*, porous beds; *D* and *E*, impervious beds; *C*, a half impervious bed; *F* and *F*, the water levels of *A* and *B*, respectively.

Fig. 6 is a section illustrating the possible effect of erosion upon strata originally like those in Fig. 6; *A* and *B*, porous beds; *D* and *E*, impervious beds; *C*, a half pervious bed; *F* and *F*, the water levels of *A* and *B*, respectively. If the stratum *C* is not practically a confining layer, the water from *A* will pass through it

and escape at the edge of *B*, so that a flow cannot be obtained at a higher level than it, but may be had below the line *F*.

Fig. 7 is a section illustrating the failure of an artesian well because of defects in a confining bed below. *A* and *B*, porous beds; *D* and *I*, impervious beds; *C*, a defective confining bed; *E*, the water level of the stratum *B*. *G* and *H*, wells that do not flow. The bed *A* might give a flow at *G* and *H* but for the defect in *C*, which permits the water to descend into *B* and escape through its outcrop, which lies below the surface of *G* and *H*.

Fig. 8 is intended to illustrate the aid afforded by a high water surface between the fountain-head and the well. *A*, a porous bed; *B*, a confining bed below; *C*, a confining bed above. The dark line immediately below the surface represents the underground water surface. Its pressure downward is represented by the arrow *m*. The pressure upward, due to the elevation of the fountain-head, is represented by the arrow *n*. The line *F* represents the level of the fountain-head. There can be no leakage upward through the bed *C* except near the well *D*. There may be some penetration from the bed *C* into *A*, which would aid the flow.

Fig. 9 is a double section illustrating the effects of high and low water surface in the cover area. In this *A* represents the porous stratum inclosed between impervious beds, *B*, *C*. The source of supply is at *H*, and proposed well at *F*. Let *E* be supposed to represent surface of ground in one of two supposed cases, and *D* the surface in the other. The arrow springing from surface *E* represents upward tendency of water in porous bed, owing to pressure from fountain-head, while the arrow depending from line *D* represents downward pressure of ground water, whose surface is represented at *D*, and is, it will be observed, more than equivalent to the upward tendency due to pressure from the fountain-head. A flow at *F* could be very safely predicted if the surface were as represented by *D*, while it might be doubtful whether one could be secured if the surface were as represented by *E*.

Fig. 10, illustrates the possibility of a flow from a bed even when exposed at a lower level; *A*, a sandstone bed, thick and coarse at the right, its shore edge, and thinner and finer at the left. *B* and *C*, confining impervious beds. *F*, the water level in *A*. *D*, a well which may flow notwithstanding the lower exposure at *E*.

Fig. 11 shows the dependence of the collecting area on the thickness and slope of the porous beds. In the left-hand figure the porous bed *A* is thin, and, coming to the surface at a high angle, gives but a small section. In the right-hand figure the bed *A* is thick, and, coming to the surface at a low angle, its beveled edge is broad.

Fig. 12 illustrates a common effect of erosion upon the surface area of the porous stratum, and the contour of the resulting basin. The dotted lines show the original contours.

Fig. 13, section illustrating the advantages of low inclination. *A*, porous bed; *B* and *C*, impervious beds. *A'* and *A''* indicate porous beds of higher dip.

We shall continue this subject of artesian wells and give some facts relating to their proper distribution in certain regions.

MELBOURNE EXHIBITION.—Thomas B. Merry, one of the Commissioners to the Melbourne exhibition, who has returned, says that "while the exposition was a magnificent success as an exhibition, financially it has been a failure, being now behindhand between £200,000 and £300,000. They had a magnificent collection of exhibits from all parts of the world. America was excellently represented. England had a vast display. France and Germany each had large courts to themselves. In fact the earth was pretty well represented. On the 31st of this month the doors will be closed, as the falling off in the attendance will make it an impossibility to keep them open to June, as at first intended. The exhibition buildings are a magnificent pile and splendidly appointed."

THE Atlantic & Pacific railroad will have the first cantilever on this coast, when the new one across the Colorado near Needles is completed. It will be 820 feet long, the main span to be 660 feet.

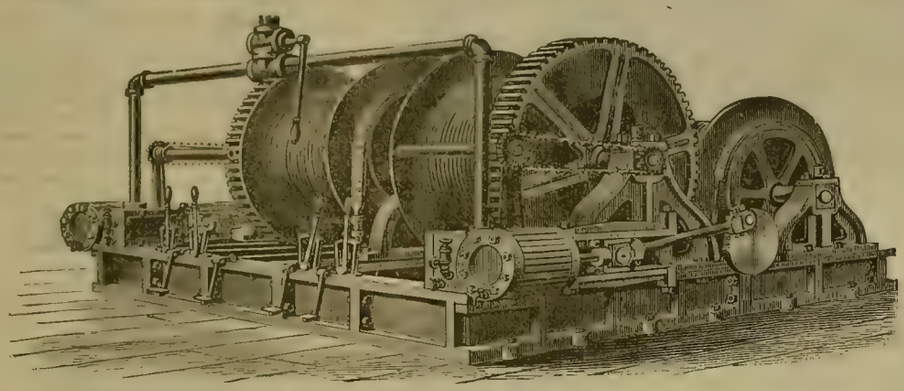
A FEW weeks ago the Harqua Hala gold ore averaged $5000 a ton; now the average has got down to $20. In California that would pay very handsomely.

Hauling Engines for Mines.

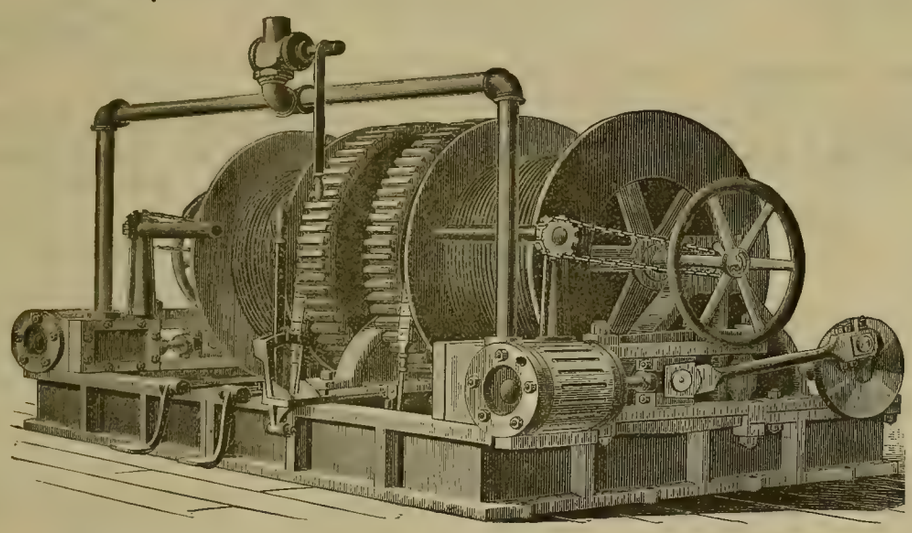
In using the "tail-rope" system in wire-rope haulage in mines, improved types of tail-rope hauling engines are made. The cuts on this page show types made by the Ottumwa Iron Works, Ottumwa, Iowa. They are described in a paper on "Wire-Rope Haulage and Its Application to Mining," read before the American Institute of Mining Engineers, by F. C. Roberts of Philadelphia. One illustrates a single two-drum engine. It consists of two engines with cranks at right angles, coupled to a common shaft carrying two pinions meshing in turn with two spur-wheels keyed to the drum shaft. There are two drums—one for the main and the other for the tail rope. This type of engine is adapted for location at either end of a haulage plant.

It is sometimes very desirable, owing to the relative position of the workings, to place the hauling engines in the center of the mine and to operate the rope-system in opposite direction from that point. To such conditions the engine illustrated in the other cut is admirably adapted. Four rope-drums are provided, enabling the operation of two separate and distinct tail-rope systems.

The motion of the drum in both the foregoing engines is controlled by an improved cone friction-device, the operation of which is simple and effective. These engines are also provided with automatic indicators, the purpose of which is to enable the operator to determine the position of the train at any moment, and consequently to govern all stoppages, and provide for variations in grade.



DOUBLE FOUR-DRUM HAULING ENGINE FOR CENTER OF A MINE.



TWO-DRUM REVERSIBLE HAULING ENGINE FOR MINING PURPOSES.

A CASE of minerals from Placer county, comprising 130 specimens of gold and silver quartz, building materials, fossils and agates, has been received at the rooms of the State Board of Trade.

THE miners at Gilman and McAllister, in the neighborhood of Seattle, are again on a strike. The trouble is caused by a dispute with the Knights of Labor.

THE longest mining tunnel in Montana has been begun at the Jay Gould mine in Lewis and Clarke county. It is to be 4300 feet long.

A Practical Traction Engine.

(*Continued from page 53.*)

down around short curves. They can also be backed readily on a curve, so they are practicable for switching.

Last season the engine hauled four and one-half million feet of lumber in 110 working days, and took two-thirds of it direct from the saw in a green, heavy condition, when it weighed five to six pounds per foot. The engine has worked two seasons without any breakage. The ordinary wear and tear consists mainly of the wheel tires, battering and hammering out the rivet-heads on the second or outside wearing tires. The machine makes 3½ miles per hour, with 15 revolutions of engines per minute.

There have been many experiments with geared machines, but there are many defects in that plan of construction. Plenty of power is developed with these direct-acting engines. The wrought-iron construction makes the machines quite flexible for road work and admits of their being mounted on springs.

These machines, though originally intended for valley work on level roads, have been found admirably adapted for work on mountain roads. In fact that is where they are most useful in acting as feeders for railroads, or hauling lumber where ordinary teaming is expensive. In going into the mountains for lumber with a 30 or 40 mile road these engines can haul out for one-fifth what ordinary teams can do. In running two engines alternately, one each way a day, on light grades not to exceed 100 feet to the mile coming out with the load, each engine could haul on a train of 15 wagons 60,000 feet of lumber at a trip at a cost not to exceed $1 per thousand for running expenses. This, we are told, is the expense where the man owns his own engines and wagons.

A special road with regular grade must be made. In some places more wagons can be hauled, according to grade. This engine can be run, of course, on grades where railroads could not be operated. In some places where freight is high, the whole plant could be paid for in a season. There are many places in the mountains where the road engine could be used with great effect in hauling mine timbers, etc.

The results of work given above are those of experience in the past two seasons in the Sierras.

Academy of Sciences.

Dr. Harkness presided at the meeting of the Academy of Sciences on Monday evening.

The following proposals for membership were made: L. Belding, ornithologist, Stockton; Waldemar Lindgren of the United States Geological Surveying Corps; James E. Mills, geologist, San Francisco; Volney Ratan, botanist, San Jose; T. S. Brandegis, botanist, Connecticut.

The following donations to the cabinet were acknowledged: A whistling swan (Oler columbianus), presented by Charles W. Kellogg; the secretary reporting that this species of fowl was more than usually plentiful in California this season; 40 skins of California birds, stuffed, including the grebe, a distinctly Arctic fowl; a blue heron from Santa Cruz, and a gull, the remainder being of all varieties, all presented by A. C. McGregor, together with 750 specimens of mounted insects, reptiles and fossils, including the boring mollusk.

E. J. Molera read a paper entitled "Notes on the Total Solar Eclipse of Jan. 1, 1889."

The following papers were read by title: "New Species of California Mammal," by C. M. Merriman; "Song Notes of Birds," by L. Belding; "Petrographical Notes on Lower California," by W. Lindgren; "Review of the Erythryna," by C. H. and R. S. Zigenmann; "Botanical Notes," by Mary K. Curran; "Reports Upon a Collection of Birds from Lower California," by Walter E. Bryant.

TRADEMARK INJUNCTION.—Judge Wallace has rendered judgment in favor of Buckingham & Hecht, enjoining and restraining Geo. K. Porter et al. from manufacturing or selling any shoes with the name of "Humphrey & Co., Boston," upon them, or from imitating said name.

IN the suit of James Landregan against Jos. Peppin to quiet title to the Morning Star and Trenton quartz mines, in Plumas Co., a decision has been rendered for the plaintiff.

EXTENSIVE GOLD MINE FOR SALE.

To be sold at public auction by the undersigned, at the Merchants' Exchange, in the City of Halifax, on Thursday the Fourteenth day of March next, at twelve o'clock noon, that extensive, valuable and well-equipped GOLD MINE known as the Dufferin GOLD MINE, situate on the Atlantic coast, about ninety miles east of said city. Daily mail from Halifax. Telegraph office at Salmon river, four miles from the works. Salmon river harbor never freezes, and is safe and easy of access. The mine embraces 342 areas, each 150x250 feet, all in one block. The entire area measures fifteen hundred feet in width across, and eight thousand five hundred and fifty feet along the lodes. The leases have nearly fourteen years to run, and can at any time be renewed for a period of twenty-one years, upon payment of two dollars per area Within this area is a belt of veins dipping on each side of an anticlinal. They have been found by tests made on the surface to extend upwards of 4,000 feet The ore has been partially removed to a depth of 200 feet over a distance of about 700 feet, and to a depth averaging about 70 feet over an additional 1,000 feet in length or thereabouts. The veins are of various width, the largest averaging about ten feet of solid quartz.

This mine was discovered in the Autumn of 1880, but was not worked to any extent until the Autumn of 1881. It has yielded up to the end of November, 31,012 ounces of gold from 64,508 tons of quartz, according to the sworn returns made to the Mines Office. The gold can be produced at a cost which will leave a very hand some margin of profit.

The mine is operated by machinery worked by water power, the power being transmitted by a line of wire rope running from the water wheel to the mine—a distance of about 4,750 feet—and lying parallel to the outcrop of said veins, at a distance therefrom of about fifty feet. The Salmon river crosses the property twice. It supplies the hoisting and pumping power, and the same water is afterwards used to drive the crusher. The latter has thirty-eight stamps, and there is ample water power to operate three times that number. Sixty stamps can be operated with present machinery Of the 120 horse-power existing for pumping and hoisting only about twenty-five is used. There are about 700 acres of well timbered and well watered land owned with the mine. This partly covers the areas, and where it does not immediately adjoins them. It is also provided with a steam plant to operate hoisting gear and pumps in case of accident to the transmission power, a sawmill, sufficient for the requirements of the property, a tramway from the mine to the crusher for carrying quartz, and stables, offices, and boarding-houses, sufficient to accommodate a large number of employees.

The mine is owned and has been operated by a partnership, and owing to the death of one of the principal owners it has to be sold to enable his estate to be settled. A good title will be given.

Terms, ten per cent cash, balance within thirty days from day of sale. The deposit to be forfeited in case the purchaser fails to complete the purchase within that time. Further particulars can be had on reference to N. H. MEAGHER, Q. C., Bedford Row, Halifax, or to JAMES DUGGAN & SONS, Auctioneers, Bedford Row.

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
Three 3-inch Sergeant Drills.
Three 5-ft. Double Screw Drifting Columns with Arms.
One 4-ft. Single Screen Stoping Bar.
One Set Sharpening Tools.
About 1500 pounds Drill Steel.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the
PAYMASTER MINING CO.,
Yuma, Arizona Territory.

SAN FRANCISCO CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.,

611 and 613 Front St., San Francisco, Cal.

LIGHTNING WELL-SINKING MACHINE MAKERS.

Well-sinking and prospecting tools sent on trial. 529 feet has been sunk in 8 hours. Instructions for beginners. An Encyclopedia of 80 Engravings of well and prospectors' tools, pumps, wind and steam engines. A treatise on gas and oil. Book free, mailing charges 25 cts. each.

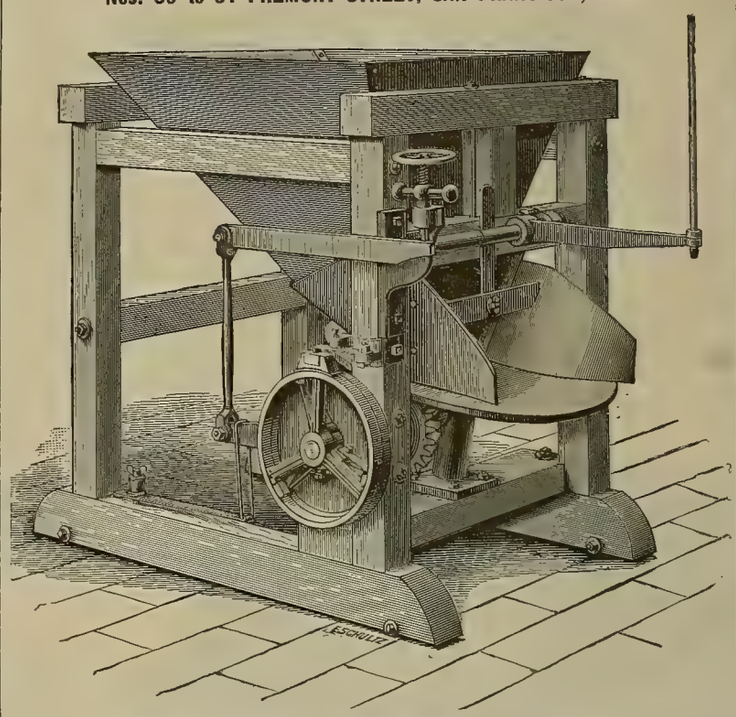
—THE—

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

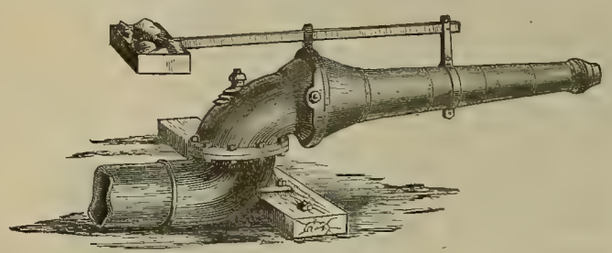
N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

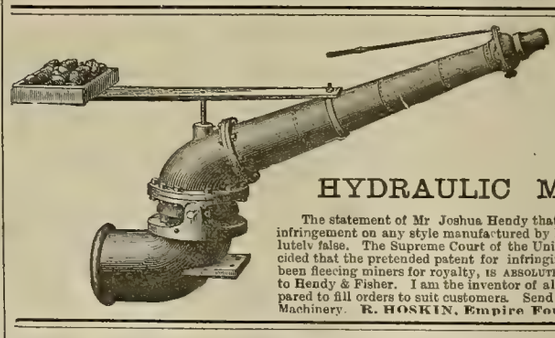
And will furnish descriptive Catalogues and quote prices upon application.

IMPROVED FORM OF HYDRAULIC GIANTS.



THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish **Single-Jointed Giants** when required. Prices, discounts and Catalogues of our specialties of **Hydraulic Mining Machinery** sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.



HOSKIN'S
IMPROVED
ONE-JOINTED
HYDRAULIC MACHINE.

The statement of Mr Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, IS ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

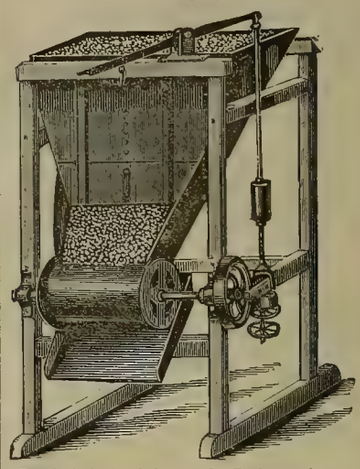
Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

827 First Street, San Francisco, Cal.

ENLARGED!

RAND, McNALLY & CO.'S
BUSINESS ATLAS,
1889.

WILL BE DOUBLE THE SIZE OF ANY OTHER ATLAS PUBLISHED.

New Size of Page, 15x21 Inches.

☞It will contain new large scale maps occupying two pages only (no cut-up maps) of all the important States.

The entire arrangement will be new, embodying the most improved methods of reference and indexing, clearly showing the location, population and commercial advantages of over 200,000 towns in the United States, Canada and Mexico.

STORAGE We have some extra room suitable for storage purposes, which we will let on very reasonable terms, DEWEY & CO., 220 Market street, San Francisco, Cal.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JAN. 15, 1889.

396,134.—VENTILATOR—P. Abrahamson, S. F.

396,251.—ROTARY SEED-SOWER—J. H. Adamson, North Melbourne, Australia.

396,142.—REVERSIBLE PLOW—Jas. A. Cole, Julian, Cal.

396,147.—CONVERTING MOTION—J. De Monnin, Corvallis, Ogn.

396,211.—BUGGY BOW SUPPORT—Kolb, Allen & St. Clair, Oceanside, Cal.

396,284.—AUTOMATIC AIR BRAKE—Geo. W. Marsh, Oakland, Cal.

396,111.—VETERINARY REMEDY—B. M. V. B. Price, Arroyo Grande, Cal.

396,250.—VEHICLE SEAT—J. A. West, San Rafael, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROTARY SEED-SOWER.—James H. Adamson, North Melbourne, Victoria, Australia. No. 396,251. Dated Jan. 15, 1889. This improvement in rotary seed-sowers consists in making the distributer of the sower adjustable so as to equalize the area over which the seed is cast, while the machine is driven at varying speed. It also consists in the construction of a feed box so that it can be readily adjusted to sow different widths and secure a more uniform distribution of the seed over the land. When the team is driven very slowly, the centrifugal force becomes less and the outer ends of the spouts will rise, pointing slightly upward so as to be in a position to throw the grain to a greater distance with a slow rate of speed; but when the speed increases, and the grain is thrown out with greater velocity, the points of the spouts are automatically depressed by the increased speed, so that the grain will be thrown to about the same distance as when the machine is driven slowly, and they thus serve to regulate or equalize the discharge over the desired area.

AUTOMATIC AIR-BRAKE.—Geo. W. Marsh, Oakland. No. 396,284. Dated Jan. 15, 1889. This is an improvement on the Westinghouse "automatic" brake. The invention consists in connection with the piston valve and sliding valve carried thereby, of a spring arranged to throw the valves back when the pressure within the auxiliary reservoir equals that in front of the piston valve, and of an exhaust port, which is opened by the slide valve when thus thrown back, so that the brakes shall be relieved only after the auxiliary reservoir shall have been supplied. This improvement need only to be used on grades, as it is there only that the necessity arises for applying the brakes again before the auxiliary reservoir can be supplied.

REVERSIBLE PLOW.—James A. Cole, Julian, San Diego Co. No. 396,152. Dated Jan. 15, 1889. This is one of that class of plows in which a double bottom is arranged to be turned from side to side, whereby it may be used as a right or left-hand plow, these implements being specially adapted for use on sidehills, from which they are commonly called sidehill plows. The invention consists in the general construction and arrangement of parts and also in the locking device for the plow bottom, whereby it is held in position and may be readily released to turn to the other side. This plow may be used on level ground as well as on sidehills.

VENTILATOR.—Peter Abrahamson, S. F. No. 396,134. Dated Jan. 15, 1889. This is one of the class of ventilators for buildings, apartments, etc., in which a passage is formed or let into the wall, said passage having apertures at opposite sides and at different elevations, one aperture communicating with the interior and the other with the exterior; and it consists in a box or casing provided with a central partition dividing it into two independent passages, each of which has apertures communicating, the one with the interior and the other with the exterior, said apertures being on opposite sides and at different elevations, the apertures on the same level in the two passages being reversed with respect to the side with which they communicate. The object is to provide in a single box or case separate ventilating passages in which the communication with the interior and exterior is reversed in the two passages, whereby a current of pure air may enter and a current of impure air may make its exit without interfering.

RAISIN-STEMMER.—Chas. L. North, Fresno. No. 395,916. Dated Jan. 8, 1889. This machine is one of that class for stemming raisins in which the fruit is passed between opposing spaced surfaces formed of wire cloth, one or both of said surfaces being movable. In the machines now in use the wire-cloth surfaces are usually arranged so that one is entirely inclosed by the other, and some of the raisins, therefore, pass around the machines several times, while others are discharged in a short time, and all the raisins are not subjected, therefore, to the same amount of operation. In these machines there is a tendency to clog up. In Mr. North's apparatus the operating passage through which the raisins are directed is short and direct and each raisin passes through but once, all being subjected to the same amount of working; nor is there a tendency to clog or choke. In this machine the raisins are fed to the side of the cylinder and are carried direct by its revolution to the opposite side, where they are discharged.

POP SAFETY VALVE.—Frederick A. Miller, Oakland. No. 395,911. Dated Jan. 8, 1889. This is one of those safety pop valves in which the excess of steam is allowed to escape suddenly and the valve returns to its seat immediately. The object of this invention is to accurately and conveniently control the amount of steam which is allowed to escape, and also to prevent any improper adjustment. A perforated cap-plate is secured to the valve in such a way that the plate may be moved axially so as to bring its perforations into more or less perfect alignment with the perforations of the valve. By moving the cap plate so its perforations are in perfect alignment with those of the valve, the full capacity of the passage through these perforations is obtained and the excess of steam pressure below, upon raising the valve from its seat, will be at once relieved by escape through the fully opened perforations. The pressure is therefore instantly relieved, and the valve instantly returned to its seat by the pressure of the spring. By moving the cap plate so the perforations are not in alignment, a less amount of steam escapes; and having to pass around the rim of the valve, the pressure will hold the valve open longer and allow more steam to escape, thereby reducing the pressure to the required degree. There is also a lock, to prevent the engineer from screwing down the shell which prevents the valve from operating under the pressure primarily intended.

Legislative.

The following is a summary of bills introduced in both branches of the Legislature since the last issue of the PRESS:

One has been read appropriating money to improve the grounds around the Marshall statue at Coloma. The amount is $4000. There will probably be a legislative excursion on the occasion of the unveiling of the statue.

The Senate has passed Britt's bill providing for the proper sanitary condition of factories and workshops and the preservation of the health of employes, and also Moffitt's bill regulating the hours of labor and employment of minors and females.

Greeley has introduced a concurrent resolution asking Congress to appropriate $1,000,000 for the improvement of the Feather and Sacramento rivers.

An Act has been introduced making appropriation for the purchase of an electric plant, pump and pipe, sewer-pipe necessary for utilizing the water of the American river for power purposes, and the erection of a power building for the State prison at Folsom, and other expenses incidental and relating thereto.

It is proposed to have an elevator inspector in cities of 100,000 inhabitants.

It is proposed by enactment to prevent undue reduction of wages paid for labor by contractors for public work.

The Act compelling the owner of any mine, factory, workshop or mercantile establishment to answer questions of the Labor Commissioner, under a maximum penalty of $200, has been passed in the Senate; also the bill limiting labor to ten hours a day for minors.

The bill to license engineers has met with great opposition from members from the interior counties.

In the Senate has been submitted an Act to amend an Act entitled "An Act establishing an Industrial Home of Mechanical Trades for the Adult Blind of the State of California, creating a Board of Directors for the Government thereof, and appropriating the sum of $65,000 for the support of said home," approved March 17, 1887.

It is proposed to make the Commissioner of the Bureau of Labor Statistics Inspector of Elevators and Machinery.

Another bill has been read this session making an appropriation of $250,000 to purchase the Bancroft library for the State.

There is considerable opposition to increasing the salary of the Labor Commissioner.

The bill by Burwell of Butte creating a State debris commission, which we mentioned last week, has not yet been considered.

A letter has been received from the United States Geological Survey informing Governor Waterman that California need have no fear that she would be neglected. The necessary topographical surveys will be made as quickly as possible, and with proper Congressional aid the Governor's idea of the irrigation of the arid lands of California will be made practicable.

The committee from the Nevada Legislature has arrived from Carson. The Nevada lawmakers desire to have the assistance of the Californians in preventing the dumping of sawdust in the Truckee river, and also in obtaining the cession of most of Inyo, Mono, Modoc and Alpine counties to Nevada.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Jan 24, 1889.

Trade the past week continued dull, although in some branches a general improvement is reported. The prevailing opinion is that the volume of business this spring will be very considerably larger than ever before. Among iron works the same confident feeling heretofore noted is still reported. All advices are confirmatory that more extensive building improvements requiring iron will be made this year than in 1888. Collections are reported to be fairly free for the year from the agricultural sections, but generally poor from other localities. The local money market is said to be working closer with the commercial banks, that is, the supply of available coin is light, while the savings banks report increased deposits. There is some inquiry for exchange on New York, necessitating in some instances the drawing against Liverpool wheat bills to accommodate patrons. It is claimed by some that large sums of money have been used by mining-stock manipulators in buying stocks from the outside public, which naturally affects the local money market. From the mining districts the news continues good. Well-informed parties look for quite an upward move in the stock market at an early day, based on the condition of the mines and the character of the work now going on in some, while in the others, very important work will be inaugurated soon. The first assertion has more special reference to Con. Virginia Savage, Hale and Norcross, Union, Ophir, Belcher, and also to one or two more. In Yellow Jacket, Seg. Belcher, and also in Belcher, crosscutting is to be started soon, and in favorable localities. The Crown Point drain-boxes are in place, and important work will be started soon in the mine. One of the dynamos for the Nevada mill was started up last week, and found to work well. Next week, it is said, both will be started up. From the Tuscarora, Bodies and Quijotoa districts, the news continues good.

The work in the Comstock mines is all to the west, toward the Red Lode.

SILVER—The local market the past week ruled dull, but then holders and consignees were firm in their views, owing to the high rate of exchange. The rate brings the price of silver up to fully 93 to 93⅛c here against 92⅝ to 92¾c in New York. The output of the mines on this coast continues to be light, barely enough for the export demand. This, judging from present advices from the Comstock and Tuscarora mines, warrants the assertion that a more decided increase will be in order in the near future.

QUICKSILVER—The market has ruled dull but firm at $42.50 throughout the week. The free call heretofore reported appears to have met the immediate requirements of the mines.

LEAD—The market is without essential change. There is slightly more inquiry, but the principal deliveries are being made on the contract sales negotiated last fall. The fruit canners are contracting for supplies for future delivery, at prices heretofore quoted.

COPPER—The market is reported unchanged, although the tone is weaker. The demand is of an offish character.

TIN—Some deliveries are being made on contracts negotiated last fall. It is claimed that Columbia-river canners will take less this year, while Alaska canners will require more. For spot and near-by tin the market is steady, but for just shipped and for prompt shipment, buyers can obtain slight concessions.

IRON—Business continues slack. The volume of pig iron going out on orders is disappointingly small, but as heretofore stated, a large consumption is looked for this year, which will create freer buying. The output of the coast furnaces is said to be fully up to former years. A new and large deposit of iron ore is reported to have been recently discovered in Nevada.

COAL—The market is gradually drifting to lower levels despite the strenuous efforts being made to sustain values. The output of the coast collieries is not curtailed. Rocky Mountain coals, unless lower freight rates are given, will soon be out of the market owing to their relatively high cost. The shipments of Australian coals to this port, will, it is claimed, soon be upon an enlarged scale. Distant cargoes and prompt shipments are weak at the quoted decline; even near-by cargoes can be had cheaper.

Eastern Metal Markets.

By Telegraph

NEW YORK, Jan. 24, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42⅝	93	$17 25	$3 85	$21 70
Friday	42 11-16	93½	17 25	3 85	21 70
Saturday	42 11-16	93½	17 25	3 85	21 65
Monday	42½	92⅞	17 25	3 82½	21 55
Tuesday	42⅜	92⅛	17 25	3 82	21 55
Wednesday	42⅜	92⅛	17 30	3 80	21 65

Borax is firm. Quicksilver is unchanged. Tin is in better demand, with an upward tendency; Straits, $21.55. Petroleum is dull. Refined barrels, 7c; plain, cases, 9c. Lake copper is almost nominal for spot or future. Best, 17¾@16c—casting brands. The stock of Pig lead is large, and the market steady.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Taylor's Iron Mountain.

Taylor's "Iron Mountain" is situated about 11 miles from Grass Valley, Nevada county. The mine lies in the foothills seven miles from the plains and 22 miles from the Sacramento river.

The ore is composed of red and brown hematite. There is a tunnel which runs into the mountain for about 100 feet, cutting three distinct ledges separately 60 feet, 44 feet and 32 feet thick. The tunnel level is 130 feet from the surface. In running the tunnel they cut through some very fine bodies of fire-clay suitable for fire-brick pottery and chinaware. The ore crops out on the above mountain in large benches, extending for a mile or more, enough being in sight to run a 25 ton furnace for many years.

About two years ago Mr. M. C. Taylor, the owner, went to England, and a company to work the mine was formed, but as yet nothing much has been done. We are informed that the plan of procedure determined upon was as follows: The company agreed to erect one 25-ton furnace in the city of San Francisco and one 5 ton Bessemer steel plant; also a narrow-gauge railroad from the mine to the most available point on the Sacramento river. This was to connect with a steamboat with four barges, which the company was also to furnish. With this through line of conveyances from the mine to San Francisco, it was calculated that there would be enough business on the route from the start to pay running expenses, receipts increasing with each year, and would finally make the investment a profitable one. The completion of the railroad would enable the company to deliver their ore in San Francisco practically free of cost.

The next calculation was to smelt the ore with coke, which would cost $10 per ton of iron produced; labor of furnace, $3; wear and tear of furnace, $2; loading ore on cars at the mine, $1; lime, $1; total estimated cost of one ton of iron, $17.

This cost of liquid iron in San Francisco at $17 a ton would enable the company to make all kinds of castings direct from the furnace. It is estimated that the addition of $6 would convert the liquid iron into steel ready to make into all kinds of castings.

CON. CAL. AND VA.—The official returns of the December ore and bullion yield of the Con. Cal. and Va. mine show that during that month a total of 11,195 tons of ore were crushed at the Eureka and Morgan mills, producing bullion of the gross assay value of $260,320 56, of which $132 766.73 was gold and $127,648 33 was silver. From a cleanup of the local assay office $5921.37 was realized, aggregating a total of $267,631 37. The average yield of the ore in bullion per ton was $23 25, of which $11 85 was in gold and $11 39 was in silver. The average assay value of the battery samples was $29 53 per ton.

GUTENBERGER'S ROLLER ORE CRUSHER.—Several improvements have recently been made on the roller ore crusher invented and manufactured by Wm. Gutenberger of Sacramento. There are now oscillating-boxes and ball joints for the bearings. This relieves all strain and friction from the main shaft. By the last steamer three of these crushers were shipped to Mexico for mines there.

ADAMS & CARTER, agents of the Frue Vanning Co. on this coast, have removed from 109 California to 132 Market street, in this city, where they have more pleasant offices than formerly, and in a central location.

THREE of the smelting companies at Pueblo, Colo., have given a silver brick each for the benefit of the sufferers by the cyclone at Reading, Pa.

E. E. EYRE, President. JAS. H. GRAHAM, Vice-Pres. & Manager. G. M. PINCKARD, Sec'y.

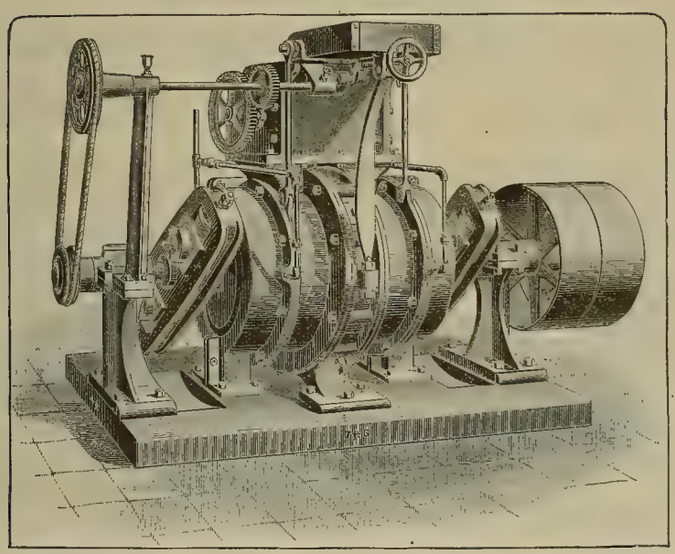
FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.



IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco.

—THE—

PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill is an effective

Automatic Ore Feeder.

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with four shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 6 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address:

JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER

GOVERNOR ZULICK of Arizona says that the building designed for a school of mines at the University is far advanced.

ONLY 506 Indians, out of a total of 20,000, attend school in British Columbia.

Mining Share Market.

The stock market has been rather active this week, though prices do not show any material advance. The Hale and Norcross and Savage companies have suspended ore shipments, and a number of miners employed in the ore stopes were drafted. A scarcity of water through the freezing of the Carson river flow, curtailing the crushing capacity of the Mexican and Rock Point mills, operated by that stream, is given as the reason of the suspension of ore shipments. The ore resources in both mines are officially stated to be by no means exhausted.

If the power test of the Nevada mill electric motors, to be made in a few days, should prove satisfactory, there will be 30 stamps in the mill available for crushing Hale and Norcross ore. The Con. California and Virginia Company continues to ship above 200 tons of ore daily to the Eureka mill, the motive-power of which has not been seriously curtailed so far by the ice in the river.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

MERRIMAC M. Co., Jan. 19. Capital stock, $1,000,000. Directors—J. P. Couch, Chas. W. Keeney, J. Christian, A. M. Ellsworth and R. W. Heath.

PACIFIC COAL AND COMMERCIAL CO., Jan. 19. Object, to erect coal bunkers in various places in California, and to charter vessels. Capital stock, $3,000,000. Directors—Wm. H. H. Hart, James Campbell, Jas. Speirs, Chas. B. Richards, A. Brunson, W. H. Martin and John Ballard.

CHILKAT PACKING CO., Jan. 19. Object, to cure and can fish. Capital stock, $20,000. Directors—John P. and E. M. Burnham, Frank H. and Theodore Poindexter.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Mt. Diablo, Jan. 23, $8136; Chollar, 23, $16,735; Confidence, 22, $16,733; Navajo, 21, $19,000; Savage, $8500; Con. Virginia, $56,295; Hanauer, $2100; Blue Bird, 19, $15,280; Lexington, $26,656; 19, Hanauer, $2300; Alice, $34,000; Butte and Boston, $23,856; 17, Hale and Norcross, $4981; Mt. Diablo, $5871; Chollar, $42,593; Challenge, $11,542; Confidence, $15,963; Hanauer, $2425; Hanauer, 16, $2525; Hanauer, 14, $5400; Lexington, 11, $2800.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. P.) from week to week and year to year.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MORE than 1200 miners have rushed to the new diggings at Chloride City and Weber in the Coeur d'Alene.

THERE are now 22 vessels on the way from Australia, bringing coal to California.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. G. H. LAMPADIUS—San Francisco and Oakland.
CHAS. F. BLACKBURN—Idaho.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Cicular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

STOCKHOLDERS' MEETING.

OFFICE OF

The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, San Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 18, 1889, at 3 o'clock P. M. By order of the Board of Directors.

J. M BUFFINGTON, Secretary.

OFFICE—Room 11, No. 303 California Street, San Francisco, California.

DIVIDEND NOTICE.

The German Savings and Loan Society,

526 California Street.

For the half-year ending December 31, 1888, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on Term Deposits, and four and one-fourth (4¼) per cent per annum on Ordinary Deposits. Payable on and after Wednesday, January 2, 1889.

GEO. TOURNY, Secretary.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

FOR SALE.

SECOND-HAND IRON PLANER,

Screw-Cutting Lathes from 12 to 30 inch swing, Punch Presses, Patent Attachment for Wood Lathes for Turning Tapers, Handles, etc. BEDROCK PRICES. Address: I. A. HEALD, 115 First St., San Francisco.

MISSES DEVLIN,

Stenographers and Typewriter Copyists,

Room 7, No. 240 Montgomery St.,
S. E. corner Pine, - - San Francisco.

A MECHANICAL DRAUGHTSMAN AND ENGINEER, with years of experience in general and construction work, desires a position on the Pacific Coast; can give the best of references as to ability. Address, F. L. DEPEW, Hotel Haviland, Suit No. 5, Boston, Mass.

DELINQUENT NOTICE.

Lord of Lorn Gold and Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment (No. 4) levied on the 19th day of December, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 19th day of December, 1888, so many shares of each parcel of such stock as may be necessary, will be sold at public Auction at the office of the Lord of Lorn Gold and Silver Mining Company, 313 California street, San Francisco, California, on Monday, the 11th day of February, 1889, at the hour of twelve o'clock M., of said day, to pay Delinquent Assessments thereon, together with costs of advertising and expenses of the sale.

L. G. HARVEY, Secretary.

OFFICE—313 California street, San Francisco, Cal.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leiber, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Antou Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

Books on Assaying.

BY C. H. AARON.

PART I.—**Gold and Silver Ores.—Price $1.**

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge, Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification, Cupellation, Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 105 12mo. pages, with illustrations, well bound in cloth, 1884. Price, $1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price $1.75.

This book is entitled "Assaying Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, $1.75 Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

The EXPLORERS' and ASSAYERS' COMPANION.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

"De man wot knows it all is alluz a-makin change, a-buyin' ob experience." The man who does *not* think that he "knows it all" about Pumps can find out a great deal about them in *Grimshaw's* PUMP CATECHISM. By mail, postpaid, **$1.** Dewey & Co., 220 Market St., S. F., Cal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE,

SUPERIOR TO IRON FOR

LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

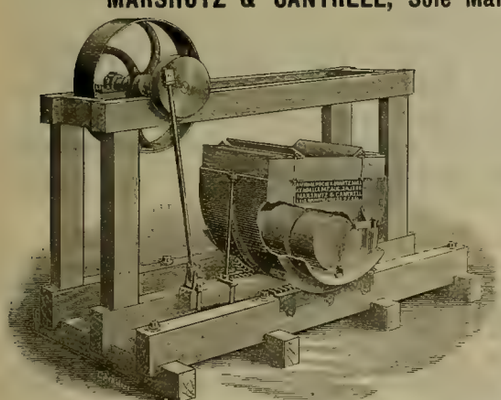
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



☞Send for Circulars and Price List.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

54-INCH BY 16 FEET STEEL BOILERS IN 2 SHEETS.

STEAM USERS, ATTENTION!

The engraving represents our standard 54 in. x 16 ft. Boiler. These boilers are made of homogeneous STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are supplied with a small hand hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 54 inches diameter by 16 feet, with 46 3½ inch tubes; Shell, 5 16; Heads, 7-16.
1 Steam Drum, 36 inches diameter by 72 inches long.
1 Breeching.
1 Smokestack, 30 inches by 60 feet, Nos. 12 and 14 Iron.
300 feet galvanized strand for Guys.
1 C. I. Front, complete.
1 Foundation Plate for front.
1 Set Grate Bars for coal or wood.
1 Back Bar Bearer.
1 Ash Cleaning Door and Frame.
1 Back Arch Plate.
1 Set Binder Braces and Bolts for Brickwork.
1 Stand for back end of Boiler.
1 Steam Gauge and Syphon.
1 Glass Water Gauge, complete, with column and 3 Gauge Cocks.
1 Safety Valve.
1 Stop Valve.
1 Feed Valve.
1 Blow-off Valve.
1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds. Total weight of Boiler and fixtures, 17,000 pounds.

☞ BOILERS ON HAND READY FOR SHIPMENT. ☜ SEND FOR CIRCULARS.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

VOLUME LVII. Number 5.

A 40-Inch Telescope.

We had a conversation on Thursday with Alvan G. Clark, the famous astronomical telescope-maker who has just returned from Los Angeles, where he went to confer with the authorities of the University of Southern California about making a 40-inch lens for a proposed telescope on Wilson's Peak. Mr. Clark says that they will go ahead and complete that telescope. He says: "I could not say that we have an order for it, but perhaps that we have a preliminary order for it. They appointed me an agent to secure prices, etc. It is to be a 40-inch telescope. The University of California is a Methodist institution which has already had a great deal of money, and they are raising money all the time.

"Their selection looks very promising. I had a good telescope and looked at many test objects. They intend to equip a complete observatory in Southern California, and they are talking of making a 24-inch photographic as well as a 40-inch glass. I do not think they intend to go into physical work to the same degree as the Lick Observatory, but in astronomical work they intend to do better if they can. The peak where the instrument is to be placed is very nearly 6000 feet high.

"I have a statement authorizing me as an agent for the trustees of the Southern California University and signed by them. Mr. Spence told me to go ahead with it and it would be all right. I am rather more favorably impressed with the southern country than when here before. It has now settled down to solid work, while before they were all busy selling land. The peak they intend to place the telescope on is back of the Sierra Madre Villa.

"This big glass will be cast in Paris. Edmund Fiel is here in this country. He is probably the best glass-worker in the world. He made the field glass for the Lick Observatory. If I grind and finish the big lens, I shall do it here in California. I have had two or three different persons ask me to do it in Los Angeles on the grounds, and they will put up buildings, etc., if I would do it here. I rather think I should work it here. It will cost them just about as much as for the big Lick telescope."

Underground Photographs.

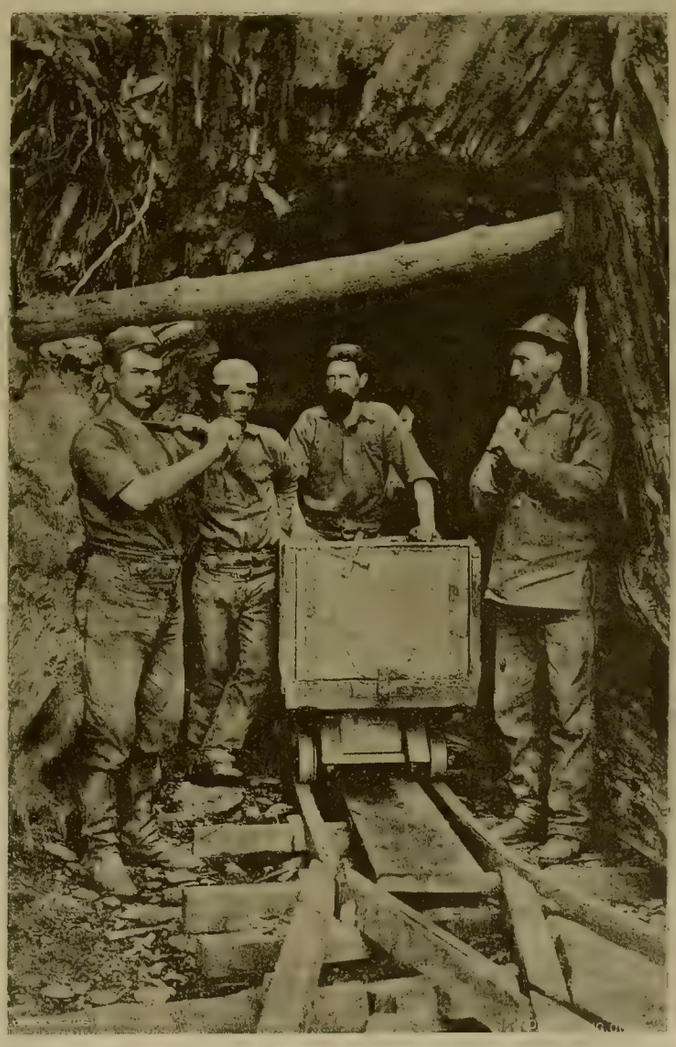
We give on this page two photo-facsimiles of views at the Dorer mine, Placer county, made from photographs taken by Geo. W. Dornin. These pictures are made direct from photographs, without any handwork or engraving of any kind. One of the views was taken in the open air at the mouth of the upper tunnel, and the other at the face of a side drift a couple of hundred feet inside the tunnel. There is little difference in the appearance of the two photographs, both of which were made instantaneously.

The main interest in giving these cuts is to show how little difference there is in obtaining good photographs, whether inside or outside a mine. The underground picture was made with the same camera and lens as the other one, and a "flash light" was used for illumination. This flash light is simply magnesium powder, which, on being ignited, makes an intense light for an instant. A reflector is placed behind the powder so as to concentrate the light at the point to be photographed.

It will be seen that the figures of the men drilling and striking are as clear as those in the sunlight at the mouth of the tunnel. This flash-light powder is much better than magnesium wire for photographic purposes, less time of exposure being required, and it being more easily ignited. By its means underground views are much more simple than formerly.

The Dorer mine, where these pictures were made, is on the divide about 3300 feet above the South Fork of the North Fork of the American river. The ore is brought down a tramway to the mill, which is of 10 stamps, driven by water-power. The water is taken from the old Sailor Bar dam (rebuilt), about two-thirds of a mile up the river from the mill.

DRILLING AT THE FACE OF THE DRIFT.



AT THE MOUTH OF THE TUNNEL.

CORRESPONDENCE.

We admit unindorsed, opinions of correspondents.—EDS

Value of Montana's Product.

EDITORS PRESS:—The press East and West, in commenting on last year's contribution to the wealth of the world by Montana, are certainly in some instances not governed by that sterling virtue, common sense. One popular journal in its New Year's issue, publishes a general write-up of our Territory, and its reporter made an assertion, based on his observation (a very correct one, I think), that the gross product of the Territory would reach $35,000,000 in money. This was followed by an editorial note stating that it would be about $14,000,000. Now either one or the other was superlatively wrong. On investigating the amount of gold and silver bullion and the copper matte shipped, with a fair estimate of the amount of silver and gold the latter contained, also the amount of ore shipped from here to other reduction works, with the values all placed to Montana's credit, the result will show the editor's estimate so far below the amount that the question will naturally arise as to whether he knew anything about the subject he was treating. He might as well have expressed an opinion on the mineral product of Spain as to have estimated the value of Montana's product at the sum of $14,000 000. Silver Bow county's product alone will foot up over $20,000,000 on a conservative estimate. The truth of this will easily be seen by an observing and intelligent news-gatherer when he learns the number of large companies operating here and the magnitude of their operations. The following is a list of the most extensive companies and the approximate of the number of men in their regular employ:

Companies.	Men.
The Anaconda and St. Lawrence	500
Chambers Syndicate	500
Boston & Montana	700
Butte & Boston	300
Parrot Silver and Copper Co	300
Colorado Mining and Smelting Co	200
Lexington	200
Alice Mining Co	225
Moulton Mining Co	200
Blue Bird Mining Co	350
W. A. Clark's properti s	200
Anaconda Smelter	1800

Numerous smaller mines with from 10 to 30 employes are not mentioned. This makes a grand total of nearly 6000 men employed directly, and those who are furnished with a livelihood through the operating of the mines of Silver Bow county will number as many more. Woodmen, teamsters, freight-handlers, etc., are all indirectly in the service of the companies through contractors, as a small army is necessary to run sawmills.

The Anaconda mine alone consumes a million feet of square timbers per month to replace the enormous amount of ore displaced by them, now averaging 2500 tons per day, and all of the other mines spoken of here are operated just as regularly as the Anaconda properties, and disburse an equal amount of money pro rata.

Taking this multitude of toilers at an average of $3 per day (and that is half a dollar less than miners' wag s here), we find the total disbursements of these Butte mines for labor to be nearly thirteen millions per annum.

Now let our seeker after information go still further, and by inquiry at the proper points learn something of the expense that is entailed in working a mine outside of the labor element, and the effect of the old maxim "that figures won't mis epresent the state of facts" when honestly and capably employed, and he will find that he has misrepresented the product of this country to a large extent. In this communication nothing has been said of the properties that have the largest dividends to their credit. For instance, the Granite Mountain, which, besides the enormous expense of building a 90-stamp silver-mill, three miles of tramway and all the regular operating expenses, has $1,800,000 to its credit for the year. The Drumlummon, although they have been working all the past year on the poorest part of their ore body, has over a half-million dollars dividend to its credit.

Then comes the Jay Gould, with only a 10-st mp mill (free gold) with nearly $200 000 to its credit. The old Hecla Consolidated is to the front again $180,000 more. While your correspondent is not inclined to boom Montana, for her own sterling worth will force her to a place in the front ranks, he takes the position that fair play is a jewel, and if our people put a product of thirty or forty million dollars worth in circulation during the past 12 months, we are entitled to the credit of it. Not only that, but we have resources for further and greater production that certainly are unequaled on the American continent. Our coal-fields are just now being opened. We have many new districts, that are in an embryotic state yet, but their mineral wealth is well known and they only lack the facilities of cheap transportation to make them producers and dividend-payers.

Our farming interests are rapidly increasing in volume and importance. The stock and grazing interests are virtually without a parallel at present, and when Uncle Sam takes the remnants of the aborigines under his protecting care, and throws open the immense Indian reservations to settlement, our Territory will stand without a peer in the united constellation of States, either in product of minerals or the production of the soil. Official statements will show us to be ten million dollars in the lead of any of the mineral producers in the Union, which will be satisfaction enough for us, and will also serve to show the manufacturers both East and West that they are neglecting their opportunities when they do not compete for the trade of this growing Territory.

Whether it is due to railroad discrimination or not, the West Coast people are shut out of this market except on fruits at certain seasons of the year. Possibly it may be that they have so much trade at home they do not reach out for this trade with the vim the Chicago merchants do. In the early years the Union Iron Works did a considerable trade here, but now Frazer & Chalmers of Chicago have almost a monopoly in their line.

I am sorry to have taken so much of your space to air my grievance over the reports of our products, but these things only occur once a year, and you and your readers can bear it for the cause of truth. H.

White Oaks, New Mexico.

What the Miners There are Doing.

EDITORS PRESS:—For a considerable time there has been nothing of especial interest to report from this region of New Mexico. Our mines have been engaged in steady development; no "strikes" of remarkable value have been made or looked for. In other words, we have reached the "business" period of mining.

At this point, the South Homestake, the property of the Homestake Gold Mining Co. of St. Louis, has reached a depth of 350 feet in the south workings, and 400 feet in the Wilson shaft. This last is now in process of sinking to 600 feet. They are also sinking on the north line of the property from the 250 level. They have a very large body of low-grade ore in the south workings, and seams and streaks of better ore. In the north workings they have a pay chute in the vein 80 feet long of very high grade.

This property has been equipped with steam hoisters at both ends, and otherwise prepared to handle ores cheaply. The company's 20-stamp mill resumed working this morning for a long season, apparently, of profitable operations. The bins and the levels are full of ore, certainly, and apparently a very large amount in sight.

The North Homestake, the property of Jas. M. Sigafus and J. E. Bird of Tarrytown, N. Y., and Congressman Hunter of Kentucky, has two five-foot Huntington centrifugal crushers at work night and day. The north or "Solitaire" shaft is well equipped with Clayton compressor, hoister, etc. Burleigh drills are used. The vein at the surface was 3½ inches wide. On the ninth and tenth levels it has been stoped out to a width of 26 feet. On No. 14, richer ore than ever is being broken out. It maintains its great width and extends to the side line of the property, going northerly.

In the south shaft a very large amount of ore of high grade was extracted in 1887 and early in 1888. That seems to have been derived from the upper part of the ore-chute, which has now (by its southerly pitch in the crevice) been carried entirely over into the South Homestake ground. The owners do not appear to be doing much at the south end at present. They have only 270 feet of depth at that point. Doubtless they have good ore below them. At the Solitaire shaft they are down 450 feet.

The Lady Godiva, owned by John W. Harrison of St. Louis and B. H. Dye of White Oaks, has recently been equipped with shaft-house, steam hoist, etc. The No. 3 shaft has a depth of 150 feet, and has s arted down under orders not to stop for anything short of 400 feet. This fine property has several parallel fissure veins. The one being chiefly developed is a beautifully defined fissure filled with quartz quite distinct from anything in the region of the Homestakes and of very profitable grade.

There are in this district two distinct systems of veins. Those having a strike of from 9° to 14° west of north are mainly porphyritic in character, have walls not very well defined, and have been chiefly developed on Baxter mountain. Here they lie in a grayish bastard granite. To them belong the South Homestake, Miners' Cabin, and the south workings of the North Homestake.

The system having a strike of from 12° to 22° east of north, partly intersects the other on Baxter Mountain, but crosses the gulch and appears in East Baxter unenhanced by such intersections. The gangue is here a quartz, black, white and amethystine, with iron; walls are well defined, and ores of higher grade. To this class belongs the Lady Godiva. A fine mill will be built for that property this summer.

The improvements made in this town the past year, in the way of new buildings, etc., have cost a large sum, and have largely added to its attractiveness as a place of residence and business. The population has nearly doubled in the last twelve months, and the volume of business done has increased in a much greater ratio.

The building of the Chicago, El Paso & Mexican railway, and its completion to this point during the year 1889, are now assured facts. Work is actually begun, and ten miles of track laid. The Rock Island has already begun the construction of its line from Liberal, Kansas, to El Paso via White Oaks; so that before we write 1890 we shall be upon at least one great transcontinental line of track.

The Parsons mine on Tanbark gulch in the Bonito district has been sold to a Chicago & Santa Fe corporation, which has taken charge. The new owners will equip the property with a 60-stamp mill in the spring. Their ore body is known to be 450 feet in width and 700 feet in length, and is believed to be much longer. Your correspondent knows all that great mass (which rises in the center to the hight of 65 feet above the general surface) to prospect satisfactorily. While the mine was run by the discoverer, he ran 2564 tons through the small mill now on the property, with average cleanups of $5.36 per ton. With his small capital and plant he mined and milled for $1.60 per ton. The company now owning the property can work cheaper than he did and also get better results.

The other mine-owners of Bonito district are getting their properties rapidly in shape. The sale of the Parsons mine has been a great stimulus to all that part of Lincoln county.

The coal mines near White Oaks are doing a good local business. The Wells-Parker coal mine has been equipped with steam hoist and steel tracks, and is in shape to do a large business.

There is a better and more hopeful feeling among miners all over New Mexico than for many years. There is every indication of capital seeking mining investments, and seeking them intelligently. Investigators and intending investors are at present seeking the aid of mining men and experts, old residents of the localities in which they wish to operate. Your correspondent is receiving more inquiries for and in reference to mining property and investments than at any time since 1881. The year 1889 will be a prosperous one for New Mexico.

White Oaks

Mines and Mills Near Kernville.

EDITORS PRESS:—Although all the large mills in this vicinity are idle, still some gold is being extracted. The Glenn Olive mill, 12 miles south of Kernville, consists of two arastras driven by steam. They crush about five tons per day, and employment is given to about 12 men. The mill is supposed to turn out about $75 per day. Mr. Packard and Judge Sumner have small stamp-mills on Kern river, below the old town of Keysville, that employ on an average eight or ten men. Judge Sumner also has two water-power arastras two miles farther up the river, at which he, like Mr. Packard, crushes custom rock. The Robinson Bros. have a small water-power arastra above Kernville, and occasionally crush a few tons from an eight-inch ledge, known as the Bob Lee, which so far has yielded an average of $115 per ton. Butterbread & Co. have two small water-power arastras on Kelsey canyon, near the site of the old town of Sageland, which are generally run when there is water.

In addition to these, in passing through the hills it is no uncommon thing to find a camp of two or three men with a horse and a few bales of hay, engaged in extracting gold by a process supposed to have been discarded for a third of a century. There are hundreds of small leads here which would pay a good profit over mining wages if the means were at hand to crush the rock at moderate expense. But, as a rule, these small ledges will not pay for the erection of a costly mill. Near where the old town of Keysville once stood, the workings show the ledges to average not more than 100 yards apart, and excepting the Mammoth, averaging not more than one foot in width. A number of men find employment here in extracting rock for the custom mills, and they seldom select anything of a lower grade than from $20 to $40 per ton.

Some development work is being done. The Bright Star Co. has recently made an important find in their mine, on Pinto mountain. Barton & Simpson are exposing a body of ore in the Old Key near Keysville, from which $500,000 is said to have been taken between the years 1854 and 1858 inclusive.

There are some thin ledges in this vicinity, either of which is capable of affording a constant supply of paying rock to a first-class mill for years; and but for the most deplorable mismanagement (not to use a much harsher term) they would now have been giving employment to hundreds of men.

There are two or three notable instances here in which the plant was not warranted by the size of the ledge. A first-class mill should never be erected on a 14-inch vein.

STEPHEN BARTON.

Kernville, Kern Co., Cal.

WHERE THE MONEY GOES.—Without endeavoring to explain where all of the money paid miners for wages on the Comstock goes, we can state with considerable reliability that the wage-earners of the Comstock have on deposit in bank something like $250,000. The Hibernia bank of San Francisco has a large percentage of this amount, and also Wells, Fargo & Co. have a big pile. The average sum paid miners and mill hands for wages on the Comstock is $224,000.—*Virginia Enterprise.*

APPRECIATIVE.—The San Francisco MINING AND SCIENTIFIC PRESS has closed Volume 56. We have "exchanged" with it for about 20 years and never opened an uninteresting number. May it last forever.—*Prescott Courier.*

That Lake of Volcanic Glass.

Relics of Extinct Civilization.

EDITORS PRESS:—I noticed in a recent issue a reprint of an article originating in an Eastern paper, relative to the great lake of volcanic glass in the neighborhood of this place, and referring also to the ruins of Gran Quivera. The author of that article has an imagination fertile and vivid enough to suggest rivalry with Rider Haggard.

The prosaic facts are, that at a point 15½ miles W. N. W. of this place is the center of the north end of the famous

Lava Beds of Lincoln County.

Measured upon a line drawn along their center, they are 45¾ miles long. For ten miles from the north end, they have an average breadth of 3½ miles. The general course so far has been at first a little east of south and then south. Here they bend to a N. S. W. course, and for six miles more have an average breadth of 2½ miles. Thence for 12 miles further the course is S. W.; extreme breadth, 1½ miles, but where crossed by the Carthage stage-road they are less than a mile in width, and where crossed by the Military and Telegraph road they are scarce half a mile. At this last point they bend to the south, widen rapidly, until ten miles below, they attain their extreme breadth of 5½ miles. Here they deflect to the S. W. again and maintain an average width of 4½ miles until they abruptly end at the head of the salt marshes in Socorro county.

They are composed of a black iron lava of in part, at least, recent origin.

The Center of Activity

Was at the north end, near the center of which and about one mile from the extreme northern point is the ancient crater now not elevated more than 200 feet above the general level. The origin of the flow was at a distance from its outburst here. It occupies in part the bed of an ancient river of generous proportions, and is underlaid by the subcarboniferous limestone. In many places it is possible to penetrate through crevices to the underlying limestone strata. Eight distinct flows can be counted, some of which were so separated by time that sand, gravel, and traces of arboreal vegetation remain between them. The last st flow was at no very distant geological period. Very slight accumulations of sand, soil or vegetation as yet appear; vast stretches are as black, bare and forbidding as when first cooled. No signs of disintegration appear anywhere, except where older lavas, partially calcareous in their composition, have been brought to the surface. This occurred during the last flow. That in many parts came on behind and beneath the older lavas like a gigantic and resistless plow, and piled the broken-up ancient lavas in vast heaps and windrows, like the front and flanks of a Canadian-river ice-gorge.

There are much larger lava beds even in New Mexico, but for savage grandeur, or for the clearness of their testimony to the resistlessness of the force employed, they have no equal within my experience of lavas, and that has extended from Vesuvius to Mauna Loa.

The Soil Surrounding These Lava Beds

Is usually a red argillaceous and calcareous deposit or wash, permeated in all directions with streaks and threads of gypsum. So far from being surrounded by extensive "beds of white ashes," they are surrounded by some of the finest grazing lands in New Mexico, and, so far as the east side is concerned, among the best watered.

They lie along the center of the superb natural valley, bounded on the east by the Congo mountains and the magnificent White Range, the loftiest in New Mexico. To the west the valley is shut in by the Chupedero Mesa and the Oscura mountains. The valley has a natural descent of 27.5 feet to the mile. Near the eastern border of the lava beds is the surveyed grade of the Kansas City, El Paso & Mexican railway.

A Former Mining Period.

The ruins of the Gran Quivera lie 40½ miles northwest from this place. Considerable remains are to be found, such as would suggest a place of considerable importance and population, and a population well advanced in arts and industries of civilization.

The irrigating ditches on which its existence depended are readily to be traced, though the bold and necessarily rapid stream from which they drew their supplies has ceased to be.

That the inhabitants were extensively interested in the reduction of auriferous and argentiferous ores is demonstrated by the buried heaps of slag still to be found. That their appliances were rude and imperfect is demonstrated by the amount of lead and silver and sometimes gold, remaining in the slags. Whence they drew their ores remains a mystery. Neither the scanty nodular copper ores of the Manzana mountains on the north nor the copper carbonates and sulphides of the Gallinas on the east account for them. Scarce traces of copper are found in their slags, and no trace remains in the neighborhood of the pyritous ores and argentiferous galenas, which were the foundations of their industry.

Another Champollion or another Moira may at some time unlock the riddle of the Cibolla. Read the pictured traces of an extinct people and civilization and give a new history and a new romance to the human race; till then, we

can only gaze and ponder and speculate upon the loves and fears, ambitions, hopes, conquests and arts of a people who have left us not even a name. D J. M. A. JEWETT.

White Oaks, New Mexico.

Washington Territory Mines.

EDITORS PRESS:—In your issue of Nov. 24th is a letter dated at Spokane Falls, and published under the caption, "Washington Territory Mines," which is calculated, if relied upon, to mislead your readers and to do injustice to Washington Territory as well as to persons who are endeavoring to do something toward the development of the mineral resources of that country.

In the letter referred to the author alludes to the "mines near Ruby City." I have personal knowledge of all the matters referred to, and there is no truth in that part of the letter.

The Arlington mine on the surface at the point of discovery fairly averaged 151 ounces of silver and $4.75 in gold. The ledge was fully six feet in width. At the time Professor Clayton reported upon the mine the ledge had been uncovered and found in place on the surface throughout the entire length of the claim, 1500 feet, and a shaft had been sunk on the ledge to a depth of 80 feet. Samples of the ore taken from the dump, with a view of getting a fair average, assayed 81 ounces of silver. A tunnel has been run which cut the ledge 210 feet below the surface. An upraise has been made on the ledge to the surface and drifts run each way from the tunnel a considerable distance. The ores from the mine have been carefully assayed, and working tests have been made by the most reliable firms in San Francisco and New York, and work on the mine is being pushed under the direction of a superintendent of many years' experience in that class of work. The mine is not for sale and the stock of the company is not on the market.

The company is satisfied with its prospects and is endeavoring to develop a mine and carry on a legitimate mining enterprise. It does not care to advertise its mine or its business, and only asks that if correspondents do meddle in the matter at all, they simply tell the truth.

What is said concerning the First Thought, Fourth of July, Idaho and War Eagle, is as incorrect as the other statements in the letter referred to. They have not had as much work done upon them as the Arlington, but what has been done shows each of these claims to be very promising, and their owners are fully satisfied with them.

If you will be kind enough to give this space in your valuable paper, it may prevent some one from forming an erroneous conclusion concerning "the mines near Ruby City."

Portland, Oregon. C. A. ALISKY.

Suspension Hoists in Mining.

It frequently occurs that the character of route renders the construction of surface planes a matter of great difficulty and expense. To such cases the application of aerial planes has peculiar advantages. These planes consist of wire ropes extending between the points of desired communication. Upon these cables the carrying vehicles or carriages travel, the ropes serving as tracks. This system, as in the case of surface inclines, admits of single or double planes and may be operated by engine-power or gravity, according to the conditions and requirements of the case.

Aerial inclines find frequent application in mountainous regions and in the hoisting of material from large open-cut mines or quarries.

Fig. 1 shows a serviceable application of the single-rope system. This system is especially adapted to quarry-work, where the loading-point is continually shifting. Fig. 2 shows the general arrangement of the double cable suspension hoist for large open-cut workings and quarries. Where the grades are excessively steep, and large output is required, the double rope system is found very serviceable. The governing principles are similar to those of surface inclines, the two ropes serving instead of the surface track. This system is applied to the diamond mines of South Africa. The cuts are from a paper of F. C. Roberts, read before the Am. Inst. M. E.

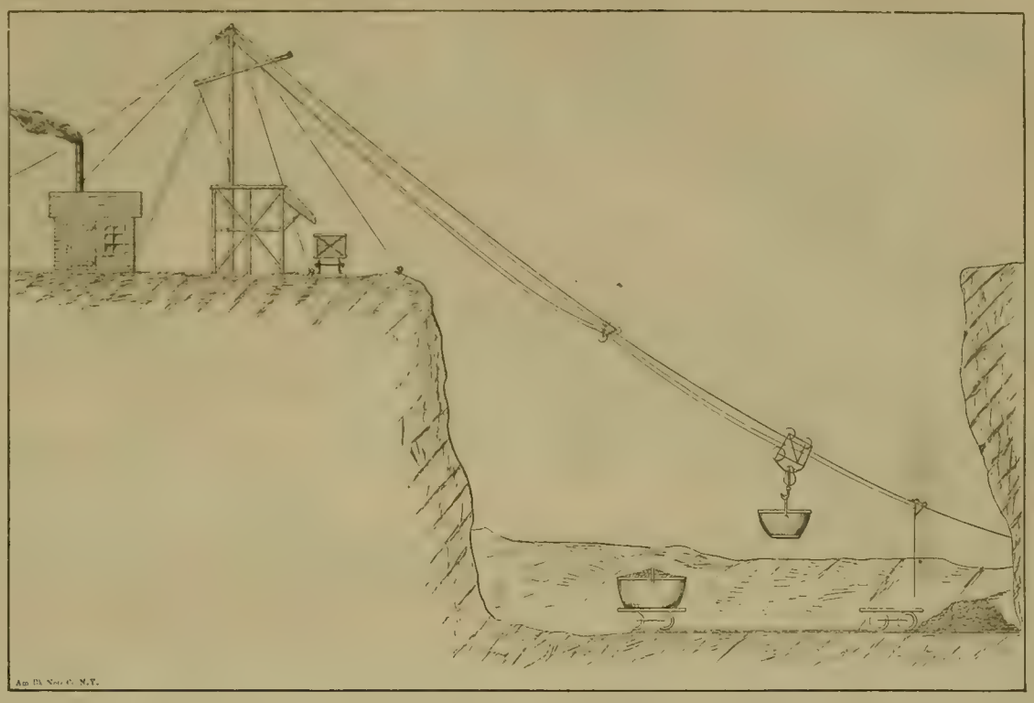

Fig. 1.—SUSPENSION HOIST FOR QUARRIES.

THE WATER-WALKER—HOW HE DOES IT.—C. W. Oldreive lately accomplished the task of walking on the water of the Hudson river from Albany to New York; distance about 150 miles; wager, $500. His average progress was 24 miles a day. He always went with the tide. The shoes he wore are made of cedar, lined with brass. They are five feet long and a foot wide. Each is air-tight, with a space in the center for the foot. On the bottom are three fins so arranged that when the shoe moves forward they are pressed up against the bottom, and when the shoe is at rest they hang downward like paddle-wheel buckets.

MONKEYS AS COIN-TESTERS.—The Siamese ape is said to be in great request among Siamese merchants, says London *Tid Bits*, as a cashier in their counting-houses. Vast quantities of base coin obtain circulation in Siam, and the faculty of discrimination between good money and bad would appear to be possessed by these gifted monkeys in such an extraordinary degree of development that no human being, however carefully trained, can compete with them. The cashier ape meditatively puts into his mouth each coin presented to him in business payments, and tests it with grave deliberation. His method of testing is regarded in commercial circles as infallible; and, as a matter of fact, his decision is uniformly accepted by all parties interested in the transaction.

WHY TINWARE IS CHEAP.—People often express great surprise at the cheapness of tinware, says an exchange. Not long ago a lady told me that for $1.20 she purchased a wash boiler and enough smaller articles of tinware to entirely fill the boiler. If they could see how quickly these articles are made they would no longer wonder at their cheapness. A piece of cheap coke tin can be made into a stewpan almost in the wink of an eye, I might say. There is a general impression that because such tinware is cheap it will not give good service, but this is not generally the case. The greatest imperfection is caused by careless soldering, but this applies only to the most inferior grades. The better grades of the so-called cheap goods have double pressed seams, which are practically everlasting. Tinware is cheap only because it is made by rapid machinery. Should this country ever produce tin in quantities large enough for home consumption, tinware will likely be cheaper than ever.

Fig. 2.—GENERAL ARRANGEMENT OF DOUBLE CABLE SUSPENSION HOIST FOR LARGE OPEN-CUT WORKINGS.

Reducing Ores on the Comstock.

Bullion-producers of the Comstock, says the Virginia *Enterprise*, can be made as numerous as there are mines on the lode. There is scarcely a mine here worthy of being called such that cannot produce ore containing more or less of the precious metals. But there are very few that can make the business remunerative to their stockholders under the present conditions and general expense of reduction. In the Black Hill country dividends are paid from ores assaying 100 per cent less than ores for the running of which we pay assessments.

The means being in existence for the reduction of low-grade Comstock ores at a big profit, their ultimate introduction upon the lode must be considered inevitable. It is simply a matter of time and the exhaustion of the conditions now existing which make their introduction undesirable.

But there are already men of perseverance and knowledge in the field figuring upon the introduction of a Russell plant for the reduction of ores by lixiviation. A 120-ton capacity plant lately erected at Park City, Utah, cost but $20,000. In testimony of the success of the process and its ability to extract a very high percentage of precious metals contained in it, the companies operating Russell plants buy ore outright, paying 85 per cent of its assay value, which is higher than is extracted from Comstock ores on the average by the amalgamating process. In other words, we have to take out the cost of reduction from the 85 per cent obtained from the ore, and the Russell people must get their cost and profit from what they can get out of the ore over and above 85 per cent of its assay value.

With the introduction of such reduction works, doing that which they represent, nearly every mine on the lode would become a bullion-producer, and there would be no excuse to run long drifts through bodies of low-grade quartz in search of fat little kidneys.

As things now exist, the bullion-producers of the Comstock are: Con. Cal. and Virginia, Hale and Norcross, Savage, Confidence, Challenge, Crown Point, Yellow Jacket, Belcher, Chollar, Potosi, Alta, Occidental, Gould and Curry, Justice and Overman—15, all told. Of the above, Con. Cal. and Virginia, Hale and Norcross, Confidence, Challenge, Savage, Alta, Justice and Overman are probably the only paying mines.

The Con. Cal. and Va. is the only dividend-payer at present. Hopes are entertained that Hale and Norcross and Confidence will resume the payment of dividends before long. Savage and Alta may also become dividend-payers this year.

BUTTE, Montana, has many smelting furnaces. Now the residents are making a fuss about the smoke. Mr. Clark says, however, that if the smelters were to shut down and stop making smoke, there would be a still bigger "kick."

THE President has approved the Act increasing the appropriation for the San Francisco postoffice site to $800,000. This is the final act of the long legislative process of securing this appropriation. The next step will be the selection of a site.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLEVELAND CLAIM.—*Dispatch*, Jan. 26: The tunnel being run in on this property is now in 125 feet. The company expects to strike pay gravel when in about 200 feet more. The mine is at Volcano, and is owned by Messrs. Cleveland and Stolcken, who have it bonded to foreign capitalists.

GOVER.—The mill started up from the new water supply Sunday, which is a great saving for the company. Heretofore they used 130 inches; now they use only 40 inches, which is quite a saving every month to the company. The mine turns out the usual quantity of good ore from the 300 and 500 foot levels. The Plymouth Con. mines are going right ahead; the water is all out and new timbers are being put in where it is found necessary; more men are being employed every day in the mine so that it will not be long before as large a force of miners as were working in the mine before the fire will be at work again. The New London is working the usual force of men and have started a crosscut at the 300-foot level. The company have quite a force of men doing assessment work on their outside locations. It is understood that a mill will be erected on the New London about the first of May which will give employment to a lot more men.

COSMOPOLITAN.—The east crosscut is in 162 feet; its face is soft slate and stringers of quartz. The west crosscut is in 58 feet with face in hard slate. They started a drift south on the ledge Monday and will also start a drift north on the ledge in about another week. The ore shows free gold and prospects well. The company will erect a mill in the spring if the outlook is as favorable then as at present. The ore body is 34½ feet wide and they will need a large mill. They can get 600 feet fall of water from the Quartz mountain reservoir for motive-power to run mill and hoisting works. Ere long the Cosmopolitan will be a bullion-producer.

ALPI.—A few men have been put on at the Alpi. The shaft has been started and the first set of timbers put in. It is proposed to erect a mill at once, which policy is questioned by some who think the better plan to be to run through a couple of hundred tons of rock in some mill near Jackson, so as to give the large body of rock in sight a test before going to too much expense. The undertaking is a local enterprise.

NORTH GOVER.—Mr. John A. Eagon, one of the principal stockholders in this property, says the owners are about to form a corporation and issue stock on the North Star plan for the purpose of working the mine.

NORTH CALIFORNIA.—This company have started the Potosi mill on their ore and will run until the water fails in August. The plates are looking very well so far.

ZEILE.—They are making a station at the 1030-foot level. A level will also be run between the 800-foot station and the bottom of the shaft.

KEYSTONE.—They are now sinking from the 1400-foot level at this grand old mine. The mill runs regularly on good paying ore.

Butte.

RICH RIVER MINES.—Oroville *Register*, Jan. 24: We visited the Golden Gate mine on Feather river this week and were surprised to see the vast amount of labor required to construct a flume for carrying the water of the stream. It is no wonder that in the early mining days, when lumber, powder, tools and labor were all expensive, this mammoth task was not undertaken. The great width of the flume necessitates a wide cutting on the high rocky points along the river, but this work has been nearly all completed, there remaining only 200 or 300 out of the 3200 feet that needed grading. The lumber for the mammoth flume has been hauled to convenient localities and other preparatory work has been done. This will greatly facilitate operations in the spring when the water is low enough to put in the head-dam. Of the richness of this stretch of river-bed, there can be no doubt. Near it were two of the richest river-bed mines ever worked in Feather river, the Greek and the Old Cape claim. The banks and bars of the river in the vicinity of Long's Bar, Adam's Bar, Morris Ravine and Thompson's Flat were all fabulously rich. There are many old miners living in this region who well remember the great amount of gold taken from the mines in and near Feather river and who are confident that the Golden Gate will verily prove a golden one to its owners. One needs to go upon the ground, note the immense labor required to drain the channel, and mark the great volume of water to form any idea of the great task undertaken. It is safe to assert that all the gold ever deposited in the channel of the Feather during an almost countless number of years remains there to-day and will remain until this great flume is completed and the channel laid dry. Some of the statements made by the miners and others who worked in the river-bed show that no part of California is richer in the precious metals than the channel of Feather river just above Oroville. Mr. John P. Leonard and H. B. Lathrop took out in one panful of earth $2200 in gold dust. Day after day the miners at work in the Cape claim took out from $10,000 to $25,000 a day. The mine was only free from water 57 days, yet during that period there was taken out $1,000,000 worth of gold dust or an average of $17,500 a day. Thomas H. Williams in 1857 took out from the Union Cape $150,000 in 21 days, yet his dams were leaky and he could not work to advantage. We have no doubt that the Golden Gate mine and the Greek mine will prove equally as rich as did the Cape and the Union Cape when the river-bed is once laid dry and an opportunity is given to work the channel of the stream.

Calaveras.

ANGELS.—*Mountain Echo*, Jan. 23: Everything is running in full blast night and day at the Nevills mine in this town. The ore body in the north stope of the 400-foot level is immense, as well as being a higher grade than any heretofore extracted from this mine. The mill is kept in constant motion and the plates present a very healthy appearance. It is quite evident that this mine will fall into the hands of a London company in a few weeks. The work of building and fitting up, preparatory to opening developments on a large scale, is going on actively at the Utica mine. The new 60-stamp mill is about in readiness for operations, and, we are informed, will be started up some time during the coming week. Everything is being put in readiness as rapidly as possible for the spring and summer campaign. This is one of the largest mining properties in the southern mines. Operations are progressing steadily at the Angels mine. The ore now being mined is said to be of a very good grade, and best of all, there are thousands of tons in sight. The mill is kept in constant operation. Work is going on continually at the Lane & Tulloch mine, situated in the southwestern part of this town. The owners are well pleased with the flattering prospects of the mine, and are sanguine that they have a valuable mining property. The mill is kept in constant motion and the ore is being crushed as rapidly as it is taken out of the mine.

PURCHASE.—Mr. J. F. Curtis of Stockton has recently purchased from E. A. Foster a quartz mine known as the Evening Star, situated on Smith's Flat, about two miles northwest of Angels, adjoining the celebrated Gold Hill mine owned by Geo. Osborn. Mr. Curtis is brimful of energy, and has had considerable mining experience. He says the claim is a good one, but will require a considerable outlay to thoroughly develop it.

STRIKE.—It is currently reported in this section that a body of ore 40 feet wide has been struck in the Calaveras mine near Robinson's Ferry. It is also said that assays of the ore have been made which yielded about $75 per ton.

Mariposa.

RED CLOUD.—Mariposa *News*, Jan. 26: Matters at the Red Cloud mine are in a demoralized state. Much of the property has been destroyed. Attachments have been levied on all the available machinery by employes. The Red Cloud is certainly a very rich pocket mine.

Nevada.

AT GRASS VALLEY.—*Tidings*, Jan. 26: The North Star Mining Company has contracted with the Risdon Iron Works for a new hoisting plant, to be erected upon the company's shaft in the Grass Valley mining district. Mr. Cutter of the Risdon Works is now in the city to carry out the contract. Of the hoisting plant now in use the reels are too small to permit of expeditious hoisting from the depth attained, to say nothing of the depth projected. The new plant will be larger and equal to all exigencies. For its accommodation the hoisting works building will be extended 40 feet. The old plant will not be removed, there existing provisions for operating it by steam in case of an emergency. "Everything is running along well, and we're doing well," was the reply made by Supt Mainhart when interrogated as to the outlook at the Omaha & Lone Jack Consolidated. At this mine there are 65 men employed at day's pay and 15 contractors and tributers. The 20-stamp mill is running night and day on good ore, and the superintendent wishes the mill were of greater capacity, for the time being at least. As yet all operations are confined to the Omaha ground, but the workings are in the direction of the Lone Jack. Developments of the last few months leave no doubt but that the enterprise is a success. Sinking constitutes the only work being done at the New Eureka. The nine contractors, working in eight-hour shifts, are making sufficient progress to guarantee that the contract price of $21 a foot will give them wages. The shaft is vertical, 8x10 in dimensions, and is now down 340 feet. At a depth of about 500 feet it is expected to cut the ledge struck by crosscutting from the 300-foot level several months ago. In sinking, several gold-bearing stringers have been cut, while the country rock is highly mineralized and bears other favorable indications. The skip put in at this mine a few weeks ago works to a charm. Two years ago, perhaps less, the *Tidings* related the prospects of the Metropolitan mine of the Moore's Flat neighborhood, as told by its owner, Geo. Abrahams. Nevertheless, Abrahams was unable to obtain capital and had to go it alone again, for mining men regarded his ledge as too big to be worth anything. Recently Happy George, as Abrahams is termed, because of his optimistic tendencies, made a strike, which, if it is to be judged by samples of the ore exhibited on the street to-day by son-in-law Reynolds, will net him the rich reward due all persevering, plucky prospectors. The quartz has a lively appearance, and carries free gold and other minerals. A mill is now wanted on the property.

COPPER.—Cor. Grass Valley *Tidings*, Jan 29: The mining interest of the western part of Nevada county should not be overlooked. Around and in the immediate vicinity of Spenceville some prospecting for copper has been done with very encouraging results, while it is well known that gold-bearing ledges or lodes exist in several localities. There has been no systematic development of any of these claims or mines outside of the Spenceville copper mine, and that one is paying large dividends to the stockholders, and what that mine is now doing can be done with several others in the neighborhood if their owners had the capital to develop them. To those who are interested in mining, no better locality can be found for profitable investments.

Placer.

SPRING GARDEN.—Placer *Argus*, Jan. 26; The Gray Eagle mine, which is the principal point of attraction, will soon be ready to start up again. I say it is the point of attraction from the fact that mine-owners for miles on each side above and below are waiting to see what the Gray Eagle are going to strike before they will undertake to locate the exact position or the depth of the channel. That the main channel comes down the divide through the Gray Eagle Co's. ground, all concede. That they have a mine none here doubt. But those above and below them do not like to "face the music" to the tune of the thousands required to prospect a deep channel mine. The Gray Eagle Co. being the pioneers in this section deserve great credit for their energy and enterprise, for undoubtedly they will be the means of bringing thousands of dollars to this point. From the present outlook at the Gray Eagle works, that company is determined to know what is on their ground. They are putting in one of the largest and finest pumping plants in the county, which, when completed, will be able to handle an enormous body of water. F. Chappellett is doing some work on his Owl creek property. The Mountain Tunnel Co. have been doing assessment work on their claim. Mr. Garber has made a rich strike in the McKinstry claim. Good reports come up from the divide. A Napa company, under the management of Mr. Gardner, are prospecting a quartz ledge near the U. S. Ranch, and show some fine specimens. Times are lively and all anticipate a large output of gold for 1889. There has been some valuable mining ground taken up as agricultural ground in this district, but the miners are determined to dispute every foot of ground with the agriculturists.

FOREST HILL.—Placer *Argus*, Jan. 26: This place is one of the liveliest in the county. The Mayflower mine has a large force of about 100 men at work and their large stamp-mill is running continually. Good paydrift is being taken out. The Breece & Wheeler mine at Bath has struck some of the richest pay ever taken out of the mine.

Plumas.

BULLION SHIPPED.—Plumas *National*, Jan. 26: Below we give the amount of bullion shipped from Spanish Ranch Express office in 1884 and 1888. The figures are kindly furnished by our young friend, W. H. Thompson, and show the effect of the injunctions on our hydraulic mines. In 1884 the shipments amounted to $79,523.21 and have gradually decreased every year until in 1888 the amount shipped was $42,122.67, being a decrease of $37,400.84.

Shasta.

FRENCH GULCH.—Redding *Free Press*, Jan. 26: From Charley Plumb, who was in Redding yesterday, the first time in a year, we learn the following French Gulch and Deadwood news: Cummings, Osborne & Morrell, on Klein gulch, have put in a rotary 12-stamp mill, which was started up on Monday on $50 rock from a large, well-defined ledge. They expect to make a cleanup in about two weeks, and big results are expected. Frank Wheeler's mine, in the same locality, is idle awaiting repairs to the battery. The Niagara is running 75 men. The mill is running constantly, making two cleanups each month, averaging $9000 each time. The Brown Bear is running about 50 men, and the McDonald mine 30. Both companies are close mouthed about their shipments, but that they are making money is well understood. Tom Green's mine, under the management of Bob Skinner, has begun to pay again, developing ore of a high grade.

POCKET.—Shasta *Courier*, Jan. 26: A lively excitement was occasioned here Thursday by the discovery of a pocket mine on Rock creek, a mile or so from town, in the neighborhood where other pockets have been found. The discoverers keep "whist" about the matter, but they shove up coin in a manner that indicates that somebody's pocket is plethoric.

NOTE THE FACT.—Jack Conant had a splendid group of claims; they were fine and desirable property; capital, big and strong, looked on with longing eye to purchase and possess; but they said give us a Government title and patent, and here is the coin. Jack saw the point; complied; is now the possessor of $150,000. The lesson is plain. Secure Government patents to your land and claims, mineral or agricultural; anything you own or claim in the land line.

Sierra.

NOTES.—Sierra *Tribune*, Jan. 26: The Kentucky mine has started up again. Jake Mess has the management of the mine. Four men are at work there. The San Luis company are receiving bids for a contract to run 200 feet in their drift. The snow in Sierra City has almost disappeared. The Sacred Mount Co. let a contract last week to Messrs. Langton, Thompson and Sharkey, to run their tunnel ahead 200 feet further.

Siskiyou.

RIVER MINING.—Yreka *Journal*, Jan. 30: More snow and rain, with warmer weather, is greatly needed for our miners to start a boom in taking out gold dust. We anticipate extensive operations in both placer and quartz mining as the days get longer and the weather moderates to prevent freezing each night. From the numerous prospectors in our mountains the past summer and fall, we anticipate the opening of several new claims the coming spring, both placer and quartz as soon as water becomes plenty for washing, and the roads are in better condition for taking quartz to mills for testing. The present indications promise a very light winter in the way of rain and snow, which will permit early operations in river mining the coming spring, while late spring rains are so customary when the winter is dry or sets in late, that placer miners may yet receive the benefit of a good supply of water.

San Bernardino.

THE NEEDLES.—Arizona *Journal-Miner*, Jan. 23: The Needles, since the recent discovery near there, in San Bernardino county, is dividing honors with Yuma, in this Territory, with her Harqua Hala strike, as the Mecca for miners, prospectors and capitalists. A project is on foot for the erection of a smelter at The Needles, since the recent discoveries near there.

Trinity.

RIDGEWAY.—Humboldt *Mail*, Jan. 26: The Ridgeway company now has a working capital of $25,000. With this amount for immediate use, Major Toms is very sanguine as to the future of the mines. The Ridgeway shaft is now down 240 feet, where the ore vein is five feet wide and the ore of high grade. Major Toms, who is superintendent of the company, will begin at once a tunnel of about 700 feet, to tap the ledge 5000 feet below the surface. This he expects to complete by the first of July. It will serve both for drainage and for tramway purposes, and will lead to the vicinity of the new ten-stamp mill, to be erected in the fall—probably in September. Meanwhile work will go on in the shaft, and the small mill kept running. Three eight-hour shifts will be put on, and the work will be pushed with all the energy that money can put into it.

Tuolumne.

STRIKE IN THE MARY ELLEN MINE.—Cor. Tuolumne *Independent*, Jan. 26: The sensation of the season over here is the rich find in the Mary Ellen mine. The vein in the upper level shows five to six feet of rich rock carrying heavy gold, and the value of the rock can be reckoned by the pound, and not by the ton. The tunnel has been driven about 17 feet since this bonanza was discovered, and the vein looks now as if it would increase in width. Groveland has long felt the need of a boom, and we hope the Mary Ellen will be one of the solid foundations on which it will rest. The river-hills near the Mary Ellen are full of location notices, and we hear of a number of prospectors who are to try their luck in the same belt of slate. This mine is now the property of A. B. Cruickshank, and he intends to erect a stamp-mill on it as soon as the season will permit, as he has plenty of rock in sight in his two tunnels to keep a mill going for a long time.

MILL RUNNING.—Cor. Tuolumne *Independent*, Jan. 26: The Black Oak mine is running its mill to full capacity. The vein is eight feet in width, and the output of ore has so crowded the mill that it was found necessary to discharge 11 miners, to maintain an economical balance of supply and demand. The rock is first-class, and the prospects were never better.

Tulare.

KEYS.—Tulare *Times* Jan. 24: The Keys mine, which is owned by J. J. Bowen of San Francisco, has redeemed its former reputation as being the richest mine in Tulare county. Al Harris & Co., the lessees, have struck immensely rich ore, which is paying about $2000 per ton. This mine it will be remembered was thought to be entirely worked out, and could have been bought for a song; but has by digging a short distance past the old works, turned out richer than ever. There are other old mines here, now lying vacant, which might by going down on them, turn out as well as the Keys.

Yuba.

REPORTED RICH FIND.—Nevada *Transcript*, Jan. 24: Jos. Miller, an old pioneer of this county, who has for many years been searching for a lost ledge near the Oregon House, is said to have found the object of his search recently, and will as soon as spring has opened take steps toward its development. The ledge is said to be four feet in thickness, carrying free gold and sulphurets. Mr. Miller claims that fragments crushed in a mortar in 1853, when the ledge was first discovered, yielded at the rate of nine cents per pound. There are many quartz ledges in that vicinity, and the attention of miners will doubtless be turned that way soon if this reported rich find proves to be a fact.

NEVADA.

Washoe District.

SAVAGE.—Virginia *Enterprise*, Jan. 26: On the 400 level the face of the southwest crosscut No. 2 is showing stringers of ore. On the 500 level the south drift from west crosscut No. 2 is in ore that averages $30 a ton. From No. 1 east crosscut on this level, in the south drift, ore is being extracted; also Nos. 2 and 3, east crosscut, 600 level. During the week have hoisted 447 tons of ore; have shipped to the Rock Point mill 339 tons; average battery assays, $21. Bullion on hand and previously shipped amounts to $18,104.

HALE & NORCROSS.—On the 550 level the north drift continues in ore of a good milling grade. The winze below this level is also in good ore. All the ore-producing sections between the 500 and 700 levels are looking and yielding well. The usual amount of ore has been shipped to the Carson river, but the usual amount was not reduced, as at the mills there was trouble for two or three days with floating ice, which, getting into the turbine wheels, caused delays. The average assays are nearly $20 a ton.

CON. CAL. & VA.—The stopes on the several levels from the 1400 down to the 1950 are looking well. On the 1650 level ore is being extracted from several floors. About the usual amount of ore has been extracted and shipped to the mills on the river, the battery samples of which will average about the same as last week.

ANDES.—The surface machinery has been overhauled, and underground work was resumed last Monday. This work is on the 175 level, the old drifts and crosscuts on which are being cleaned out and repaired with a view to their further extension. A new hoisting cable was yesterday placed on the reel.

CONFIDENCE.—The south drift on the 1300 level is still in a mixture of quartz and porphyry. The face of the joint Challenge and Confidence drift on the 300 level is still in quartz. The weekly shipments to the Brunswick mill amount to about 450 tons of ore of the average assay of over $28.

BELCHER.—Good headway is making in the drift on the 200 level since setting up the blower at that point. Are making good progress in the work of cleaning out the north drift on the 1100 level. There are no changes in the ground passed into at any point that are worthy of note.

BENTON.—The Benton Con. management is negotiating for the purchase of the hoist plant and building at the Ward shaft, owned by the Bullion Mining Co. The plant is one of the finest on the lode and is in first-class order.

CROWN POINT.—The new east crosscut (No. 2) on the 800 level continues in a vein material composed principally of quartz and porphyry. The work of cleaning out the south drift on the 1100 level continues.

YELLOW JACKET.—The usual shipments of ore are being made, and there is much good milling ore in sight at several points. Some prospecting work is still being done.

OVERMAN.—The usual amount of ore is being extracted and sent to the Vivian mill, Carson river. A good deal of milling ore is still in sight in the mine.

BALTIMORE.—The usual work is being done in the exploring drifts on the 350 level. The ore extracted is stowed away in the openings on the level.

CHOLLAR.—The usual amount of good milling ore is being extracted from the ore-producing sections, and the Nevada mill is running steadily.

ALTA.—The producing sections are yielding the usual quantity and quality of ore, and the mill is kept running to its full capacity.

SEG. BELCHER.—The usual progress is making in the joint south drift on the 1100 level. No change of material worthy of note.

CON. IMPERIAL.—On the 1100 (Yellow Jacket) level, east crosscut No. 2 continues in a mixture of clay, quartz and porphyry.

POTOSI.—A considerable amount of exploration work is being done on several levels, and a large amount of ore is in sight.

CHALLENGE CON.—On the 300 level the north drift, joint with Confidence, is being advanced at the rate of 30 feet per week in a material of favorable

appearance. Are shipping about 150 tons of ore a week to the Brunswick mill, the average of which is over $28 a ton.

GOULD & CURRY.—The exploring drifts on the 200 and 450 levels are passing into material carrying some metal.

JUSTICE.—The ore-producing sections continue to look well. The mill is able to reduce 40 tons of ore per day.

OPHIR.—The material in the south drift on the 1465 level continues in a mixture of clay, quartz and porphyry.

OCCIDENTAL.—About the usual quantity of ore is being extracted from the stopes on the 300 and 550 levels.

UNION CON. & MEXICAN.—Good headway is making in the main joint north drift on the 1405 level.

NORTH OCCIDENTAL.—The 250 and 400 levels are still yielding a considerable amount of milling ore.

SILVER HILL.—Preparations are being made for a resumption of operations in the old upper levels.

BEST & BELCHER.—East crosscut No. 2, 50 feet below the 300 level, continues in good ore.

UTAH.—The north and south drifts are still in vein matter of a promising appearance.

SCORPION.—The usual progress is being made in the west crosscut on the 400 level.

Belmont District.

BULLION.—Belmont *Courier*, Jan. 26: Lessee J. E. Severance shipped this week 12,254 ounces of silver bullion. This is very encouraging for Nye county. The Monitor Belmont mill has produced many large silver bricks this winter. The Barcelona mine at Spanish Belt continues to yield good ore and the work of development is pushed with energy.

Eureka District.

MISCARRIED.—Eureka *Sentinel*, Jan. 26: It seems that the project to start up the Eureka Con. furnaces under lease to Messrs. Donnelly and Davis has miscarried. They had secured the furnaces, arranged for the Dunderberg spice dump and were in readiness to come up and begin operations, when it was discovered that the Eureka Con. could not make such a bargain under its contract with the Richmond Co. without the consent of the latter. This, Mr. Probert refused to give; so at latest advices the whole scheme was considered to have fallen through. There will be no starting of the Eureka Con. furnaces by the gentlemen named unless some new arrangement is entered into. It is hard for the camp.

CONTRACT.—Another contract for 50 feet of the Ruby hill tunnel has just been let. Manual and Hooper are the contractors. The trustees of the company feel confident that not more than one or two contracts will be necessary to carry the tunnel into the ore belt.

Moss District.

MONTREAL.—Esmeralda *News*, Jan. 26: The Montreal mine is again coming to the front. Recent developments made tend to show that it will soon be yielding large quantities of the precious metal. Quite a lot of work has been done in the mine, and there is a ledge therein about 30 feet wide, carrying ore which assays all the way from $15 to $500 a ton in gold. The owners of the Montreal, in addition to their former working force, sent four men out to work on the mine last Thursday, and intend to thoroughly prospect it.

Pioche District.

RAYMOND.—Pioche *Record*, Jan. 25: One hundred and eighty-five feet of the Raymond shaft is timbered from the 200-foot level to within 15 feet of the surface, which will be reached in a few days. This covers a part of the shaft which always gave more or less trouble even when first used, as it was slightly out of alignment. This defect is now remedied and the shaft at this part is said to be in better condition than ever before.

Tuscarora District.

NAVAJO.—*Times-Review*, Jan. 26: Crosscut from west vein, 350-foot level, has been extended 23 feet. Upraise south of the stopes has been carried up 20 feet. The stopes on the different levels continue about the same.

COMMONWEALTH.—100-foot level: No. 2 east crosscut from south drift has been advanced 21 feet through vein formation. Intermediate drift from No. 4 chute has been extended seven feet, still developing good ore. 225-foot level: No. 1 west crosscut has been advanced 11 feet, being very close to the winze from the 150-foot level. Line crosscut has been advanced 16 feet in vein matter giving low assays. 300-foot level: No. 1 west crosscut has been advanced 18 feet through very favorable looking porphyry. Gangway has been advanced 11 feet; rock is hard blasting.

NEVADA QUEEN.—North drift, 450-foot level, has been advanced 20 feet; it is looking more favorable and assays better than for some distance back. The stopes continue about the same as last reported. East crosscut from west gangway has been extended 13 feet, showing a little mineral. Line crosscut 225-foot level of Commonwealth has been advanced 16 feet. The concentrating works have been kept running steadily and doing good work.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—The shaft has been sunk and timbered 11 feet the past week; total depth, 110 feet. A station is being cut out at 100 feet below the collar of the shaft and will be completed in a few days, when sinking will then be resumed. At 95 feet the shaft passed into and through about 10 feet of vein material, highly mineralized, a portion of it showing very high-grade ore.

BELLE ISLE.—Drift south from east crosscut, 250-foot level, has been extended eight feet. The vein shows an average width of over two feet. The assays average low grade. The general appearance of the vein is very encouraging. This vein has not been cut at any other point in the mine.

GRAND PRIZE.—East and south drifts on the 400-foot level are being cleaned out, and concentrating ore which has caved in hoisted and piled on the dump, assays from which show $35 per ton.

NORTH BELLE ISLE.—The working force has been doubled and greater progress will be made. There is no material change to report in any of the workings.

Wild Rose District.

A RICH STRIKE IN THE WILD GOOSE.—*Silver State*, Jan. 23: The mining news from Spring City is of an exciting character, and unless reports are exaggerated that camp will soon be booming. The most reliable information is to the effect that a four-foot vein of black sulphuret ore has been cut at a considerable depth in the Wild Goose, one of the Paradise Valley Co.'s mines. For some time past this mine has been producing a good grade of milling ore, and hoisting works were erected for the purpose of sinking a shaft to a depth of several hundred feet. In this shaft the vein of sulphuret ore was discovered, and it is said to be so rich that it will not pay to concentrate it for shipment. This new find has elated the people of Paradise as well as of Spring City, as lively times in the mines benefit the farmers, who can then find a market for all their products at home.

RICH ORE.—*Silver State*, Jan. 26: The ore body recently developed in the Wild Goose mine, owned by the Paradise Valley Co., averages four feet wide and $200 per ton. The extent of the ore body along the vein is not yet known, but it continues as far as the ground has been prospected.

ARIZONA.

THE HARQUA HALA MINES.—San Diego *Sun*, Jan. 23: Wyatt Earp and William Bryson have just returned from Harqua Hala mining region, about which there is considerable excitement just now, and Earp was seen by a *Sun* reporter this morning. "Bryson and I left here two weeks ago last Sunday," said Earp, in answer to questions. "We went by the Southern Pacific to a point in Arizona called Sentinel, 70 miles east of Yuma. At Sentinel we got rigs and an outfit and started for the camp, which is 65 miles due north. When we arrived there we found there was a camp of from 200 to 250 people, most of them living in tents. Anybody can see that the whole region is rich in minerals. I have visited a good many mining camps, and I do not know of any that showed better prospects than are to be seen there. The particular mine that has attracted attention is only a hole about six feet deep and six feet across. It is located on the side of a hill or knoll. It appears from what they say there that for years the Indians and Mexicans, and some white men, have been running over that ground prospecting. But they always hunted in the gullies and canyons, and never thought to prospect the hill. One day about two months ago a couple of miners were crossing the hill and sat down to rest. In some way they got to breaking the loose rocks, when free gold rolled out in chunks bigger than they ever saw before. Then they dug some and they claim they took out free gold in pieces a foot long. Those specimens were sent away before we got there, but I myself saw pieces as large as half of my head. Just before we came away Bryson was talking with one of the proprietors of the big mine, and told him he didn't want to take back simply a report, but would like something to show folks. The miner just jumped down in the hole and knocked off a piece of rock that showed the gold sticking out all through it. After these men had dug down six feet they stopped and put a price of $200,000 on the claim. They have been waiting for a buyer, but just as we were going away they had about concluded to go on with the mine themselves. They tell us that within six weeks or two months there have been taken out between $30,000 and $40,000 from that region, and I am willing to believe the story is not much exaggerated. In the Mojave Indian language Harqua Hala—I think it should be spelled Jarqua Jala—means flowing river, and an old Indian that comes into camp there says when he was a boy a river used to flow all the time at the foot of the hill. It is dry now, however, but by sinking a well a few feet plenty of water can be found. All the mining that has been done has been by the dry wash or placer mining, but there will be no trouble to get water for pan washing or hydraulic works."

BRITISH COLUMBIA.

ORE SHIPMENTS.—Donald *Truth*, Jan. 15: The Monarch mine at Field, up to Friday night, had shipped 325 tons of ore to the company's smelter at Vancouver. Supt. Davis has 30 men employed about the mine, and is pushing along as fast as possible outside work that will prevent delays during the winter from a too great depth of snow. The mine is looking well for the amount of development work done. While the value of the ore is not exactly known, it is safe to reckon it at $50 a ton, which would give a total value of $16 250 for the three weeks' output. The company's smelter is expected to start up early in January.

WORK TO BE RESUMED AT ANTHRACITE.—No better news for this section of country could be announced than that work is to be immediately resumed on a large scale at the Anthracite coal mines. It not only gives fair-pay work to many men who are now much in need of it, but establishes a base from which miners and prospectors can operate into the northern portion of Kootenay district. A great part of the coal goes to the sugar refineries at San Francisco.

JUBILEE MOUNTAIN.—Latest advices from the Jones & Wells camp are that they have over 200 tons of ore on the dump ready for hauling to the steamboat landing on the Columbia, distant six miles. They expect to haul 10 tons a day all winter. Capt. Armstrong's boats will have down-trip loads, as well as up-trip ones, as soon as navigation opens in the spring.

COLORADO.

LEADVILLE.—*Journal*, Jan. 24: The Haytrosser shaft, situated on the Big Pittsburg property and leased by Hewitt & Danforth for a period of five years, is now 360 feet in depth where the leasers are drifting in iron. They still intend sinking farther, where they soon expect to strike a large body of high-grade carbonates. The Maid of Erin mine is now working a force of 150 men—100 underground and 50 on top—shipping from 200 to 250 tons of ore per day. The Brookland shaft is working at present a force of 30 men, who are taking out and shipping about 15 tons of ore daily. The shaft has a depth of 640 feet. The company contemplates starting up its concentrating-mill about the first of the coming week and will employ a force of about 25 or 30 extra men to run it. The capacity of the mill is 100 tons every 24 hours. The Wolftone shaft of the Agassiz Con. M. Co. is being worked at present by 15 men. The company intends, however, putting on a large force of men as soon as the machinery can be put in place in the concentrating-mill. The mill requires about 100 men to run it to its full capacity. Shaft No. 6 of the Robert E. Lee, which is under lease to Mr. Robert O'Neil, is shipping from 15 to 20 tons of ore every day. The lessee is now running a drift expecting shortly to cut a fine body of ore.

DAKOTA.

LEACHING.—Deadwood *Pioneer*, Jan. 24: Leaching ore already roasted will begin at the reduction works to-day. The Golden Reward company is working a force of 18 men. Ore is being extracted from different places and daily forwarded to the reduction works. Returns from a carload of ore recently shipped to Omaha were received by the Double Standard Co. yesterday. Check accompanying shows the ore averaged $32 per ton. The company will continue shipments. An intelligent estimate of ore actually in sight in what is known as the Ruby Basin and Bald Mountain districts places the value thereof at $30,000,000. From the mouth of Fantail gulch to the base of Terry's Peak, 500 tons of ore can be mined daily. This is reliable and was obtained from an intelligent miner, who knows every foot of the ground. This ore will go from $20 to $100 per ton.

IDAHO.

NEARLY COMPLETED.—Idaho *Avalanche*, Jan. 26: The addition to the De Damar mill at this place is rapidly approaching completion, and will soon be ready to receive the machinery now at the mill. When ready to start up in the spring, the capacity of the mill will be about 30 tons per day. It is expected that a mill will be built at Wagontown this year, with a capacity of at least 100 tons a day, especially for ores from the Wilson mine. The Nellie Stoddard quartz mine is looking better than ever. The work now being done has developed the fact that what appears to be country rock turns out about $50 per ton in gold. There is no telling how extensive the mine is, and it is probably unlike anything ever found in the Territory. As depth is attained the ore gets richer. The width cannot now be determined. The pay chute has been traced on the surface for about 600 feet.

YREKA DISTRICT.—Wardner *News*, Jan. 19: Work on the Sierra Nevada is progressing with its accustomed vigor in tunnels A, B and C, the principal operations being confined to tunnel A. In this a large amount of stoping is being done and the ore procured is of so high a grade it needs no concentrating. Tunnel A has reached a distance of 450 feet and work on its further extension progresses daily. Tunnel B has been run 375 feet and tunnel C 360 feet. The hand jigs are no longer found necessary, the crusher being the only piece of machinery utilized in the mill, as all the ore now extracted is sent in a crude state to Wickes, Montana. The mine is looking better than ever; 40 men are kept constantly employed, and a shipment of 20 tons of ore is daily made.

PLACER CENTER DISTRICT.—The Granite Co. has found it expedient to close down its mill on Canyon creek, near Wallace, for the same reason given for the suspension of other concentrators, but work will be continued on the mine on Nine Mile on which the principal operations will be confined to the lower tunnel. This will be made the main working tunnel and will be driven to cut the ledge. The mine is looking splendidly and by the course now adopted work will progress to better advantage.

LA LANDE DISTRICT.—Supt. P. Clark of the Poorman mine, at Burke, found it necessary to suspend operations at the company's mill in consequence of the vast accumulation of concentrates and the lack of transportation facilities. A few men will be kept at work, but to increase the 500 tons of concentrates already on hand is deemed imprudent, until some means for their speedy shipment is made apparent.

BEAVER DISTRICT.—The Fay Templeton Co., at Delta, suspended work temporarily in its mill last Saturday, and will not resume until after the arrival of some new concentrating machinery. A small force of men will be kept employed developing the mine.

TIGER.—The Tiger mill and mine are still being worked, and with the exception of 10 or 12 men on the night shift, operations are progressing with wonted regularity.

MONTANA.

WHITLATCH UNION.—Montana *Mining Review*, Jan. 26: It is rumored on the street that a big deal is on, if indeed it is not already consummated, which has for a basis the world-famed Whitlatch Union mine, at Unionville, and other properties contiguous thereto. The purchasers are said to be a syndicate of Butte men, and some flying rumors connect some names of well-known St. Paul men with the transaction. This deal if conducted to a successful issue will infuse new life into this long-abandoned camp and revivify one of the richest suburbs of Helena. Last Friday the 60-stamp silver mill of the Alice company at Butte again commenced at its fullest capacity crushing ore from the Alice mine, after having undergone a period of partial idleness for the past several months. It is thought that the other 20 stamps of the company will also be in full operation within a month.

A COPPER DEAL.—Butte *Inter-Mountain*, Jan. 24: A new enterprise has been put on foot in this country which may result in adding another heavy copper producer to the long list of big mining enterprises here. For some time past Hon. John R. Toole of Anaconda, who is in the employ of the Anaconda smelting company, has been buying and bonding mines in the Camp Creek district, and it was supposed that he was acting in the interest of the Anaconda company. The mines bonded by Mr. Toole are, as stated, in the Camp Creek district, about twelve miles east of Melrose. They are called the Banner, Clipper, Columbia, Cecil, Clipper Fraction and Ben Lomond, and are owned by the Moffett Bros. and Messrs. Traynor, Ingram and Roberts. The mines have some of them been bought, and others bonded by the company in question, between $50,000 and $60,000 having already been expended. When the bonds are taken up, as Mr. Toole is confident they will be, the group will have cost the company in the immediate neighborhood of $100,000. In this enterprise Mr. Toole is acting for New York capitalists, and not for the Anaconda company as has been supposed. Mr. Toole is also financially interested, and will superintend the operations of the new company. The mines mentioned all carry copper ore running from 25 to 30 per cent. The principal amount of development done so far is on the Clipper and Banner, which are located on the same lead. Shafts have been sunk on these properties to a depth of about 100 feet, and the lead at the bottom is fourteen feet in width. A force of twelve men is now engaged in these two shafts.

SAN FRANCISCO.—Phillipsburg *Mail*, Jan. 24: In our last issue we mentioned the recent report of a strike in the San Francisco as being true and which has been predicted by so many. The main strike was on the 550-foot level. They had to run 18 feet to the vein. This placed them under the ore displacement where they have over two feet of good ore, one streak of this being exceedingly rich, averaging 350 odd ounces to the ton, heavily laden with ruby. The balance of the ore chute averages about 150 ounces, the latter carrying considerable antimony and galena. The vein is large, strong and compact. Little work has been done as yet on this strike. Mr. Smith went to Helena this week to purchase a new pump. A shipment of 21 tons of ore was made this week through Austin's sampler to the Omaha smelting and reduction works.

HELENA DISTRICT.—*Mining Review*, Jan. 26: Like many another, the Helena district has taken advantage of the favorable mood of the weather, and as a result much development work has been accomplished in that locality, some of which has added not a little to the material worth of the district.

ONLY DEPTH NEEDED.—From the developments of the past year it would seem that depth only is needed to assure the future of Helena district, and it would seem as if the prediction of a Colorado expert who visited this section last summer, that great depth would cause the different lodes of the district to concentrate into one vast body of ore, is destined to be verified.

THE HARD CASH.—During the latter part of the past week, at a depth of about 52 feet, the shaft on the Hard Cash lode encountered a fine body of carbonate ore, there being at the depth mentioned about 3½ feet of vein matter with ore on both the foot and hanging walls. Since the strike referred to the vein has been showing rapid improvement.

NEW MEXICO.

ORE.—Lordsburg *Liberal*, Jan. 26: A carload of ore will be shipped from the Bachelor mine to-morrow. A carload of high-grade copper ore was shipped this week from the Carlos mine to Belleville, by Vanhall & Greaves. The Mexico Mining and Milling Co., formerly the Viola Co., is steadily at work on its property at Pyramid. The work is under the management of O. E. Colby, who has a force of six men at work. The assessment work has been done on the Viola and the men are at work on the Penelope, extending the drifts on the 40 level. A carload of ore was shipped from the Penelope to the El Paso smelter last week.

OREGON.

THE MONUMENTAL.—Bedrock *Democrat*, Jan. 21: Mr. J. R. Bowick of the Monumental mine is in the city for a short stay. To the reporter he stated that the company's operations were progressing nicely, with one exception, that experienced miners are scarce and on this account they were experiencing no little difficulty. The company would increase their working force at once if miners were to be had. The mill is in fine working order and it is expected to commence crushing on ore from the Monumental the coming week. It is the intention, also, to do custom work and thus greatly benefit the numerous mine-owners in the vicinity.

SPARTA.—Mr. C. Cooper is one of the owners of the Little Pittsburg mine upon which a contract was let some time since for development work. The latest reports from the mine are very encouraging to the owners, and Mr. Cooper's visit there is to formulate arrangements for the erection of a mill on the property in the early spring.

UTAH.

THE FIVE-TWENTY AT OPHIR.—Salt Lake *Tribune*, Jan. 27: W. H. Hennefer returned yesterday from a trip to Ophir, where he has been inspecting the Five-Twenty mine. He says a five-foot vein of rich ore has just been struck, and thinks the property will develop into a big thing.

THE MINERS RESPOND.—The miners at the Brooklyn mine, Bingham, were the first to respond to the call of the Ore-Producers' Association for money to secure legislation to stop the importation of Mexican lead ores. R. G. Legg, superintendent of the Brooklyn, and each miner contributed one day's pay for this cause, and the result was shown in a check for $115.50 sent to the association. The promptness with which these men responded to the call shows that they understand fully what competition of peon labor means for American miners and mining interests. The association needs money to secure the desired legislation.

EUREKA MINE.—The Eureka mine has commenced the shipment of ores again after a stoppage of a short time on account of bad roads. The Centennial-Eureka is still holding its ores because of bad roads. This mine has considerable ore ready for shipping, but the company is not in a hurry about sending it out.

NEW LAST CHANCE.—The new Last Chance Co., Bingham, have their mill running steadily during the daytime, putting through 25 tons of ore per day. The concentrates being shipped bring from $50 to $60 per ton. Only enough miners are employed to keep the mill running during the daytime during the winter.

THE SMELTERS.—The Mingo smelter is running its stacks, while its receipts of ore are equal to keeping the smelter running at this rate. The Hanauer smelters are making their regular output of bullion, and find no trouble in getting a supply of ore.

MECHANICAL PROGRESS.

A Good Mechanical Suggestion.

The *Metal Worker* of a late date says:

Builders of special machinery may be excused for not informing their clients how to order duplicate parts. Those who make standard machines, however, would confer a very great favor on their patrons if they would, in addition to cuts of machines, publish in their catalogues sectional or skeleton views with the different parts numbered. Then, when a machine breaks down, the operator can order by telegraph, if necessary, giving the number of the part broken. Hardly any two machines from different shops will agree upon the technical name of an inferior or subordinate part of a machine, although they may always correctly designate the main working parts. Shop phrases and special terms are current in one establishment which are a totally unknown language when used in speaking to a workman employed in another shop. The language is still more mystical to the operator on the machine, who may not be a practical machinist, but in every other respect a trained workman, thoroughly competent and perfectly equipped to perform his task on it. Take, for instance, a steam hammer. The hammerman may be an expert in the use of the tool, but knows very few of the technical names of the parts. If his hammer breaks down he is at a loss how to describe the portion broken unless it is one of the main parts or he has been so long in his position that he has somehow picked up the terms employed. In his ignorance of the names used he would probably have to make a sketch of the broken part and send that by mail, or forward the pieces by express or freight and lose a great deal of very valuable time, which would be saved if he could order by number by telegraph. This is assuming that builders of machinery issue catalogues. All of them do not, however, it being a remarkable fact that some very important engineering establishments in this country consider a catalogue superfluous. When written to for a list of their standard machines they can only furnish photographs of a few, and make their customers work in the dark if they desire to order other sizes or patterns. The catalogue is an essential in a systematic dispatch of business, and next come the sectional views with numbered parts as an important chapter in the table of contents.

AN EMBROIDERY MACHINE.—A London paper says: Experts have long sought to devise a process whereby the delicate arts of the embroiderer could be added to the necessary requirements to which the sewing machine has been made to minister. Not a few times has the sewing-machine trade been aroused into eager expectation by the claims which oversanguine workers in this field have put forward for the latest product of their inventive fancies, but it would seem that an invention designed to meet this want has at length been cast in a more practical mold, and as no special skill is required in its manipulation, an embroidery apparatus may now be set up in every household. It is stated that the apparatus, which is of German origin, may be attached to sewing machines of almost every kind. It consists of a system of conducting-rods, with which the embroidering-frame is connected, and with which is combined the pantograph. By the aid of the pantograph the design is transferred on a reduced scale, the otherwise necessary tedious tracing on the cloth to be embroidered is no longer requisite, and with a single pattern the design may be embroidered *ad infinitum*. But in order to rightly appreciate the work which the new machine is capable of performing, it is necessary to have seen in operation a sewing machine fitted with it, for only by so doing can one fairly realize the wide extent of work, ranging from simple darning to the most complicated patterns in embroidery, which the machine is capable of performing. It need only be added that in order to secure a wide application for the new machine, an arrangement has been made with one of the largest sewing-machine companies to push its sale, and as the price is such as to induce every possessor of a sewing machine to make the slight outlay involved in the addition of the embroiderer, it is not unnaturally assumed that among the owners of the 5,000,000 sewing machines calculated to be in use in the United Kingdom, this new adjunct should find a ready sale.

TRANSMISSION OF POWER BY CABLE.—The transmission of power by cable, much in the same manner as a cable is applied in the transmission of cars, was recently put to practical test in Chicago, for the first time in America. In this case, however, instead of passing along from one building to another, the cable was conducted to widely separated parts of one large building on Market street, Chicago, and with the most satisfactory results. The cable used was a manilla rope seven-eighths of an inch thick and 750 feet long. The rope went round the driving-wheel and winding sheaves three times, and then was carried 150 feet north on 12-inch pulleys of the same pattern as with the North Side street-car cable. There it furnished power to a moving incline, and then was carried 200 feet south and thence eastward 75 feet, where it drove a barrel-lift. Eighty feet northward it furnished power to another barrel-lift, and then returned to the driving-wheel, where it moved a second incline. The slack in the rope was taken up by a sliding-wheel on the same principle as in the street-car cable. The driving-wheels had V-shaped grooves in which the rope was pinched and prevented from slipping. The cable was tested running at the rate of 1600 feet a minute. It was found that about five-horse power was taken up in driving the machinery when not loaded. The engine is 40-horse power.

Another Reported English Discovery.

It is well known that the great Bessemer process for converting iron was first discovered by an American ironworker of Pittsburg, Pa. We gave in these columns, a few weeks ago, the full particulars of the American invention and the manner in which, by his want of means, and the lack of confidence in his discovery by American capitalists to whom he applied for assistance, the poor inventor was compelled to part with his invention to the English inventor.

And now comes to notice another important discovery in working iron, to which we alluded a week or two since as having been made known by an English inventor. Under the head of "A Belated Discovery" the *American Manufacturer* says:

In our English letter published in the issue of December 14th, the correspondent gives an account of a discovery said to have been made recently by Mr. Chas. Wood, president of the Cleveland, England, Institution of Engineers This discovery, which Mr. Wood announced but a short time ago, is that it is possible by the addition of about 1½ per cent of silicon, white iron can be converted into gray, and that by regulating the proportion results similar to those effected in the aluminium and other alloys now so largely used in foundry work can be obtained.

In this Mr. Wood seems to have discovered a principle long known to American founders. It has been practiced in Pittsburg for at least ten years. High silicon iron has been made in Ohio for over 20 years, and Western founders used it in place of Scotch iron. For at least ten years the Licking furnace, at Newport, Kentucky, has made this iron from mill cinder, and in 1879 the managers of the furnace mentioned called attention to the chemical change which took place when the iron was used with old car-wheels and other hard iron. This fact was embodied in a circular sent to consumers generally at the time. The advantage of using a certain percentage of silicon to work up burnt scrap has been made the basis of numerous alleged discoveries, which enterprising men years ago, and even within the last few months, have attempted to foist upon Pittsburg founders. Hence it is certain that Mr. Wood's discovery is new only to himself, and in announcing it to the world he shows himself to be sadly behind American metallurgists.

A NEW PADLOCK.—Among the novelties put on the English market is a new padlock called the swivel, the object of which is to simplify the operation of locking. The swivel is reversible, so that the shackle can be opened from either side. A further advantage in the new lock is that, owing to there being no open space by the shackle, moisture is effectually excluded. Another English manufacturer is putting up sash cord in boxes, which have an opening in front, through which the end of the cord passes. This system is referred to as largely adopted by other English manufacturers, and is said to be far preferable to the old method of doing up the goods in hanks.

A GREAT INVENTION.—The slot device for ensnaring pennies, nickels, quarters and dimes originated in England, and was imported to this country by the ever-enterprising Erastus Wiman, who, it is said, owns the American rights of the invention. The patent is an extremely broad one, covering every possible application of the principle involved. The new automatic opera-glass attachment in theaters puts a royalty in Mr. Wiman's capacious pocket, just as the weighing-machines, lung-testers, etc., do.—*N. Y. Tribune.*

THE PRODUCTION OF IRON AND STEEL in France shows a steady decrease from year to year. The output in 1883 reached 3,570 000 tons, and dropped to 2,712,000 tons in 1887. The almost complete cessation of railway enterprise is accountable for the decrease in the demand for steel, and while six years ago the iron and steel works consumed over 6,000,000 tons of coal, they did not consume more than 4,000,000 tons last year.

A NEW PISTON has been patented by P. W. Williams for single-acting vertical engines, having as its object the ready removal of the fluid which condenses in the cylinders. The top of the piston is made with an inclined surface, so that the parts at the exhaust port are lowest, and the fluid collecting on the top of the piston is carried downward and blown out when the exhaust port opens.

A NEW TOOTHED WHEEL.—John T. Redington of Ambler, Pa., has invented a toothed wheel, which is so constructed and arranged that a tooth or teeth may be easily and readily removed in case they become injured or broken and new ones substituted. It is a very simple arrangement, but will undoubtedly prove of great advantage.

SCIENTIFIC PROGRESS.

THE REASON WHY.—Leguminous plants enrich the soil, according to Prof. Breal; but the nitrogenous principles which enter so abundantly into the constitution of plant-tissues are derived neither from the soil nor from the manure; while by their dead leaves and roots they enrich the soil by their reserves of nitrogenous matter. The knots or nodes on the roots are full of bacteria, and the latter are the intermediary agents by which the plant obtains its supply of atmospheric nitrogen. For example: if a soil be totally deprived of nitrogen, while containing the other elements of plant food, and some of these bacteria be sown therein, leguminous plants, lucern, peas, lupine, etc., will thrive, while plants not belonging to the same order will perish. However, in the case of cruciferæ, cabbage for example, the roots are often full of these nodosities too. Prof. Breal does not tell us if bacteria here play a parallel part. Perhaps the animalcule is not the same, just as in the case of hydrophobia, fever, cholera, etc., where each disease has its distinct disease-germ or microbe. When a few knots from the roots of lucern were crushed and then thrown in a medium devoted to peas, the roots of the latter became speedily covered with knots, and it was found that the percentage of nitrogen in the seeds had been augmented. Similar results followed with lupine. Now, when the latter was grown upon the same soil, but deprived of the artificially added bacteria, the lupine plants died off. Profs. Soxhlet and Weiske draw attention to the fact that when milk "turns" in a dairy where cattle are fed on grains or acid fodders, the cause is not to be sought for in the food, as the organic acids of the rations are burned and utilized in the animal's system, but in the microbes or germs produced by the fermentation of the food, and that they find their way into the milkpail.

SOUND, LIGHT, ETC.—Sound is the sensation produced on us when the vibrations of the air strike on the drum of our ear. When they are few, the sound is deep; as they increase in number, it becomes shriller and shriller; but (says a writer in the *Popular Science Monthly*) when they reach forty thousand in a second they cease to be audible. Light is the effect produced on us when waves of light strike on the eye. When four hundred millions of millions of vibrations of ether strike the retina in a second, they produce red, and as the number increases the color passes into orange, then yellow, then green, blue, and violet. But between forty thousand vibrations in a second and four hundred millions of millions we have no sense capable of receiving the impression. Yet between these limits any number of sensations may exist. We have five senses, and sometimes fancy that no others are possible. But it is obvious that we cannot measure the infinite by our narrow limitations. Moreover, looking at the question from the other side, we find in animals complex organs of sense, richly supplied with nerves, but the function of which we are as yet powerless to explain. There may be 50 other senses as different from ours as sound is from sight; and, even within the boundaries of our own senses, there may be endless sounds which we cannot hear, and colors as different as red from green, of which we have no conception. The familiar world which surrounds us may be a totally different place to other animals. To them it may be full of music which we cannot hear, of colors which we cannot see, of sensations which we cannot conceive.

FISH GILLS—THEIR COLOR, ETC.—Lift up the gill covers and under them will be seen a soft, dark-red mass, not unlike a slice of raw liver. This is part of the gills. Leave them for the present and open the mouth. To all appearances it is rather a small mouth in proportion to the size of the fish. Nothing worthy of notice will be seen at first, the only objects within the mouth being the tongue, which is quite small and hard, and a number of pink projections arranged in successive rows and looking like long and very slender teeth. By this time the water will have become much discolored and must be changed, a slight, dark-red stream continually oozing from beneath the gill covers. Before placing the fish in fresh water, take it to a tap and allow a stream of water to flow into its mouth and out at the gill covers. How is this? The scarlet hue of the head is rapidly paling, and in a few minutes disappears altogether. It does not belong to the living fish, although most persons assume that the scarlet hue is the normal color of the herring's head. The living fish is of a pure silvery white, as I have often had the opportunity of seeing. The red hue only shows itself after the fish has been removed from the water, and is due to the extravasated blood. Again look under the gill covers. The gills are there, but so altered as scarcely to be recognized as the dark-red masses which were seen before. They have lost all their color, the water having washed the blood out of them, and are now pale gray. Moreover, they are evidently not solid masses, but are composed of several layers, each layer being formed of a vast number of delicate plates, leaflets or laminæ.—*Longman's Magazine.*

SACCHARINE AS A SUBSTITUTE FOR SUGAR.—A commission of Paris doctors was recently appointed by the Minister of Commerce to examine into the properties and effects of saccharine as a food. The commission condemned its use. It is not only not a food, but its antiseptic properties render unalterable and indigestive whatever food it is mixed with. Hence it checks or retards the physiological actions which produce the change into sugar of the starchy food which may be taken into the stomach. Hence the decision that saccharine should not be used as food and cannot replace sugar—its use seriously disturbs the digestive functions and induces dyspepsia. As an offset Dr. Fahlberg, its discoverer, pronounces the report as cowardly and unfair.

PHOTOGRAPHING RIFLE BALLS.—The interesting process of photographing rifle bullets in motion, by means of the electric light, presents some remarkable phenomena, judging from the experiments made by Mach, the Austrian chemist. In this operation his plan is to illumine the bullet by letting it break an electric current formed, but the velocity of the bullet must exceed that of sound, in order that the conditions of the air before and behind the projectile can be shown. After various experiments he succeeded in his efforts to photograph projectiles fired by Wernal and Jurde guns, having respectively an initial velocity of 438 and 530 meters per second. The photographs obtained in this manner showed an air formation in front of the bullet, having the form of a hyperbole, while behind it almost a vacuum was formed, in which, when the initial velocity was very great, there were some curious spiral motions. From the description given, there appeared from these photographs to be a great similarity between the motion of a body through the water and that of a projectile through the air.

USE OF THE BEAVER'S TAIL.—It is a common belief that the beaver uses its tail as a trowel to plaster the mud on the walls of its house and dam. Capt. Hardy studied the habits of the animal in Nova Scotia some time ago, and came to the conclusion that this opinion was not well founded. The vulgar opinion that the broad tail of the beaver was used to plaster down the mud in its work has long since been pronounced erroneous. Its real use is evidently to counterpoise, by an action against the water in an upward direction, the tendency to sink, head foremost, when propelling itself through the water by its powerful and webbed hind feet, and at the same time supporting the load of mud or stones in its forepaws under the chin. Our Indians laughed at the idea of the trowel story. That and the assertion that the tail is likewise used as a vehicle for materials may be considered as exploded notions.—*Youth's Companion.*

STILL ANOTHER ALLEGED IMPROVEMENT IN TELEGRAPHY.—There has lately been invented a new system of synchronism which, it is claimed, will make it cheaper to telegraph messages than to mail them. Dr. J. Harris Rogers of Washington, D. C., is the inventor, and he claims that the world will be almost revolutionized by his discovery. The new system, Mr. Rogers says, reduces the English alphabet to ten elementary characters. The messages are prepared by means of a machine resembling a typewriter and manipulated in the same manner, and by the use of ten keys, one for each character, any desirable message can be written. A test of the new apparatus was lately held at New York, and a message of 76 words was sent in 25 seconds, and printed on a tape in plain Roman characters. The inventor says that he can by this system make one wire do the work that ten do now by the system in vogue.

BIRDS AS VENTRILOQUISTS.—At a recent meeting of the American Ornithologists' Union, Mr. Ernest E. Thompson of Canada said that some birds, especially sparrows, have ventriloquial powers. Birds, when surprised in the act of singing, will be silent for a moment, and then give forth a faint song that seems to come from a distance, though the singer be not farther than ten feet away. Thrushes and robins, the lecturer said, also have this power.

EARLY FOOD USE OF OYSTERS.—In cleaning out the lower levels of the caves at Dordogne, in France, there were found a great many oyster shells piled in such a manner as to show that the Neanderthal man used the bivalve as a common article of food. The oyster is thus demonstrated to be the oldest domesticated delicacy known to man.

ANOTHER COMET DISCOVERED.—A telegraphic dispatch received by the Director of the Lick Observatory states that a faint comet was discovered by Wm. R. Brooks at Geneva, N. Y., on Jan. 15th, at 14 minutes past 11 o'clock in the evening. Its position was right ascension 18h. 4m. and declination 21° 2'. Its motion was rapid westerly.

EXPLORING CENTRAL CHINA.—M. Martin, a French Siberian explorer, will soon start on an expedition to Central China and the unexplored regions of Eastern Thibet. He will have a small escort and will carry with him a complete outfit of astronomical and topographical appliances. He will be gone three years.

A LUSCIOUS SPRING.—It is said that a spring of natural cologne has broken forth in the southern part of Algiers The liquid has not been analyzed, but its odor is very similar to that of patchouli.

USEFUL INFORMATION.

Why Pianos Get Out of Tune—A Growing Plant a Remedy.

"This is the time of year when we are driven nearly crazy with work," said a tired-looking piano-tuner to a New York *Sun* reporter. "Everybody wants his piano tuned for Christmas, and most of them forget about it till the last moment. And besides being the busiest season, we have been having the most trying weather. These cold, dry days throw pianos out of tune every time, and besides that the sounding-boards are beginning to split. It always surprises me what poor care most people take of their pianos. Let a man buy an expensive watch, and he'll treat it as though it were a live thing, but people don't seem to realize what a delicate piece of mechanism a good piano is. Pianos are not affected so much by heat or cold as they are by dryness and dampness. Of course, if you stick one end of a piano up against a stove, or a heater, or a register, and let the other end come near a cold, leaky window, it'll raise Ned with it, but most people are on to that. The trouble is, the piano is too dry.

"You know the sounding-board—the life of a piano—is forced into the case when it's made so tightly that it bulges up in the center, or has a 'belly,' as we call it, on the same principle as a violin. The wood is supposed to be as dry as possible, but, of course, it contains some moisture, and gathers a lot more on damp days and in handling. Now, when you put a piano in an overheated, dry room, all this moisture is dried out, and the board loses its 'belly,' and gets flabby, and finally cracks. Even if it doesn't crack, the tone loses its resonance and grows thin and tinny, and the felt cloth and leather used in the action dry up, and the whole machine rattles, and everybody kicks.

"How can you prevent it? Easily enough. Keep a growing plant in the room, and so long as your plant thrives your piano ought to, or else there's something wrong with it. Just try it, and see how much more water you'll have to pour in the flower-pot in the room where your piano is than in any other room. Some people keep a huge vase or urn with a sopping-wet sponge in it near or under the piano, and keep it moistened, just as a cigar dealer keeps his stock. They keep this up all the time the fires are on."

DIFFERENCE BETWEEN WOOL AND HAIR.—Although there is a very great difference between wool and hair, it is found quite difficult to correctly explain what that difference is—the one sometimes seems to run almost imperceptibly into the other. A correspondent of the St. Louis *Globe-Democrat* furnishes the following very interesting paragraph on this subject: The difference between wool and hair is not so great as might be supposed, since very fine hair bears a strong resemblance to very coarse wool; but when the microscope is brought into operation a marked difference may be observed. The surface of the hair will appear to be perfectly smooth, as though it were polished, while the surface of a fiber of wool is imbricated, as though the trunk were covered with infinitely small scales. A hair is therefore seen to be an entirely different thing from a fiber of wool; and a further variation is noticed in the fact that hair never curls in the way wool does, for hair—when it is curly at all—curls in long, wavy lines, and wool in short half circles, which almost return into themselves. The texture of wool is also varied by fine lines, from 2000 to 4000 in the inch; so, by means of the microscope, wool may be easily known from cotton or any other animal or vegetable fiber.

AN ECONOMICAL CONTRAST.—In 1816 one bushel of corn would buy one pound of nails. In 1889 one bushel of corn will buy ten pounds of nails. In 1816 a pair of woolen blankets cost as much as a cow; in 1889 a cow will buy five pairs of woolen blankets. In 1816 it required sixty-four bushels of barley to buy one yard of broadcloth; in 1889, sixty-four bushels of barley will buy twenty yards of broadcloth. In 1816 it took twenty dozen eggs to buy one bushel of salt; in 1889, twenty dozen of eggs will buy ten bushels of salt. In 1816 it required one bushel of wheat to buy one yard of calico; in 1889, one bushel of wheat will buy twenty yards of calico. With these figures before them, who can justly claim that farm products are not improving? The outlook for the productions of the farm is certainly hopeful. The farmer can exchange his crop for more of the necessaries and luxuries of life than at any former period in the history of our country. Let farmers take courage; what they produce will always bring money or a large equivalent in needed supplies for the family.

A POINT IN STONE BREAKING.—It is well known that a stone, however large, may be broken by striking a sufficient number of blows with a hammer along the line where it is desired to break the stone. In this process the force of the blow is expended in gradually weakening the cohesion of the particles in a line following the direction of the blows. This weakening is increased by each successive blow until finally rupture occurs.

TESTING ROOF SLATES.—A German trade journal advocates the following method of testing the quality of roof slates: The samples of the slate to be tested should be carefully weighed, and then put into boiling water for a quarter of an hour. The water must, however, be fairly free from lime, saltpeter and ammonia. The slates are then reweighed, and those that show the greatest increase of weight are those most capable of resisting deterioration.

BREAKING UP SHIPS.—The Norwegians break up worn-out wooden ships in a singular way. They take the vessel to some dangerous point on the coast, and anchor it there, leaving it to be broken into bits by the sea in the first heavy gale. The fragments are carried ashore, and are collected and sold at good rates for firewood.

A GOOD EXAMPLE.—The German Empress wears an apron at home as a token that she attends to the children and the cook, and does not meddle with social and political questions, nor seek to win a place in the intellectual world.

THE LAW ABOUT POSTAL-CARDS.—Persons sending postal-cards who write upon the address side of them "in haste," or other words unconnected with their delivery, subject them to letter postage, and they are held as unmailable.

PEACH-STONES FOR FUEL.—In Vaca valley some of the farmers are burning peach stones for fuel. They find them equal to a good quality of coal and cheaper, as the price of the peach-stones is only $6 per ton.

INDIANS.—It is a curious fact that there are as many real Indians in New York State as in Minnesota—about 500.

BLINDERS FOR HORSES.—In Russia, where blinders are never used on horses, a shying horse is almost unknown.

GOOD HEALTH.

Health of the State.

We collect from the monthly report of the State Board of Health for December the following information in regard to the general health of the State:

Mortality reports received from 75 cities and towns within the State give collectively the number of decedents as 917, in an estimated population of 700,600 exclusive of those towns reporting no deaths, having a population of 10,500, so that actually in a population of 719,100 the mortality gives the exceedingly low percentage of 1.27 per 1000 for the month of December, when the death rate is expectedly increased everywhere within the temperate zone. If our mortality reports were reported as they should be, from every village and town in the State, we have no doubt the same condition of diminished mortality would be found. We trust the Legislature will see the importance of so amending our health laws that reliable statistics may be obtained, as by them we can demonstrate clearly the advantages of California as a health resort.

Reports received from 65 towns indicate, with few exceptions, that the amount of sickness is very limited, and what does prevail is of a mild and not serious character. This may be owing to the favorable temperature throughout the month, which was not characterized by any sudden changes.

Diarrhea and dysentery have subsided almost everywhere. Cholera infantum is almost entirely absent from the State, or so seldom met with that it is no longer reported. Measles is reported in several places, but the number of cases is very limited, and it is no longer epidemic.

Scarlet fever is more widely diffused, but in a very mild form.

Diphtheria occupies quite an extensive range. Dr. H. N. Miller, writing from Colfax, says that 13 cases came under his observation during the month, but the type is mild. We have yet to learn upon what factor or factors the type of an epidemic depends, and, again, to what we owe the appearance of certain diseases in regular cycles, appearing and disappearing with a certain regularity that has so far baffled the sanitarian.

Croup accompanies diphtheria with unfailing regularity, almost compelling us to believe in the identity of the diseases.

Whooping-cough was in North Bloomfield, Lodi, Angels Camp, Anderson, Downey, Placerville and San Francisco.

Erysipelas was observed in Red Bluff, Fresno, College City, Cedarville, Newcastle, Downieville, Sierra City, Lincoln, Truckee and Lockeford.

Typhoid fever is reported in quite a number of localities. The range over which typhoid fever prevails would indicate that sanitary defects exist in these places that ought to be remedied. Typhoid fever is, of all diseases, the most preventable, and if the Sanitary Inspector, which the State hopes to appoint according to law, does nothing but instruct the people how to keep clean and prevent the development of typhoid, he will have earned his salary and saved the State many thousands of dollars.

Remittent fever is mentioned as prevailing in many places, but in type is not severe and mortality very limited.

Pneumonia still prevails to a considerable extent, but is not nearly so prevalent as it was in November.

Continued Evidence of Cancer Cures.

Since the publication of the pamphlet "On the Curability of Cancer," which was issued from the office of the MINING AND SCIENTIFIC PRESS in October, 1887, and contained the names of a large number of patients who have been pronounced by well-known physicians of this city as afflicted with cancer, and who were subsequently *cured* of that dread disease by Mrs. Dr. Cook of 224 Post street, San Francisco, there have, from time to time, been discharged as cured of the same disease no less than *forty* in number, nearly every one of which cases had been pronounced genuine cancer by competent physicians, before being treated by Dr. Cook. All these names, with their postoffice addresses, have been placed in our hands. There are several other cases who are unwilling that their names should be given out. There are also now under treatment many persons who are in a fair way of recovery.

Of course, during this time the doctor has lost quite a number of patients, all of whom, however, have come to her in a late stage of the disease and after they had been for a longer or shorter time under the care of other physicians. Not a patient has been lost who has sought her aid in anything like an early stage of the disease or before having submitted to other and severe treatment.

After the large number whose names and addresses have already been given, with more or less full particulars in regard to the cases, it would be superfluous to give either the names or particulars of these many added cases. Suffice it to say that they have all been added to the list within the last 15 months, and that the list is open to the inspection of any who may choose to call for that purpose. We will also furnish it to any who may desire to receive it by mail. We make this statement as a general answer to the numerous queries as to whether we still have the same faith in this treatment as we did two years or more ago when we first entered upon this discussion.

THE CAUSES OF BOILS.—A boil may attack any portion of the body, but it oftener appears on the neck than on any other part, and no spot seems to the patient so undesirable to have it as the very one upon which it is located. The causes of these painful visitations are not well understood. They occur not only in the debilitated, but in those who are seemingly in ordinary health. Some writers assume that they are the result of a low and depraved state of the system induced by general debility, excessive fatigue, nervous depression, improper food and exercise, irregularity of the functions of the body, and the like. Not unfrequently they appear on athletes while training. There are certain diseases—among them diabetes—during the course of which boils, singly or in corps, are quite apt to occur. They are also noted in skin affections, which are characterized by severe itching; the constant irritation of the skin seems to invite their appearance. Certain medicines when used externally are capable of producing an eruption of boils. One writer says: "To judge from the previous observations, I think I may say that individuals who have a rough skin, thick, dark hair, and a vigorous growth of hair, are more predisposed to the formation of furuncles."—*Boston Journal of Health.*

TOBACCO SMOKE.—In the country districts of England, 40 or 50 years ago, it was universally believed that tobacco smoke was a prophylactic against fever. Nurses smoked at the bedside of fever patients, and friends were called in to take a hygienic pipe in the sick-room. The superstition has been dissipated by the known results of careful scientific investigation. It has, however, been revived in Florida by the reported fact that not a single cigar-maker has been attacked by yellow fever throughout the course of the epidemic, which has ravaged Jacksonville so terribly. The physicians there, it is said, recommend tobacco smoking as preventive, even women being advised to take an occasional cigarette as a precautionary measure. This will prove a pleasant doctrine to smokers, who will argue that the greater includes the less, and if tobacco will keep away the infection of yellow fever, it will serve as a preventive to other minor maladies as well. So it will. 'Tis fear kills more than infection, and in a believer's mouth a pipe may be an antidote to fear.

A POISON STOPPER.—An ingenious stopper has lately been patented for use in bottles containing poisons. The stopper is made of india-rubber, and is surmounted by a perforated ball of india-rubber, brightly colored so as to render it distinctive in the light, and containing a bell which rattles when the bottle is moved, thus drawing attention to the character of the contents even though it be impossible to see the label. Such a warning stopper would have rendered impossible many of the accidents which have, from time to time, taken place, notably one a few months ago, when a distinguished surgeon lost his life owing to a mistake as to a bottle containing poisonous medicine.

ENGINEERING NOTES.

SLIPPING OF LOCOMOTIVE WHEELS.—The *Railroad Gazette* thus effectually disposes of a current fallacy: "The statement that engines slip continually while running at full speed is often made, but almost invariably by persons of no practical experience, who appear to be unaware that any slip of the drivers can be instantly detected by an engine-runner. Any one who has run a fast train knows that on entering a damp tunnel, slipping occasionally occurs, but the vibration imparted to the engine is so peculiar that no one who has once felt it is likely to fail to recognize it again. Messrs. Abbey and Baldwin, when making some observations on the running of a Jersey Central express passenger engine on the Bound Brook route, found that the slip at high speed was practically nil. The wheels, as calculated from their diameter, should give 298 98 revolutions per mile. A counter showed that 298 62 revolutions per mile had been actually made, the difference being negative and only one-third of a revolution per mile, or within the limits of errors of observation. As these engines are run very hard and made to do their utmost, it might reasonably be expected that they would show slip, if any existed, at high speed. It is, therefore, reasonable to suppose that any contiguous slipping at high speed is non-existant. The continuous slipping theory is supported by so very little evidence, either practical or theoretical, that it must take its place among the numerous other pseudo scientific delusions."

THE GREAT FRENCH LOCAL CANAL, about which much has been said of late, between Bordeaux on the Atlantic and Narbonne on the Mediterranean, will cost some $130,000,000 and will be about 330 miles in length. It would save a detour *via* Gibraltar of about 700 miles. The plan contemplates a canal with a railroad along its banks, by means of which locomotives could be used to tow the canal boats, by means of which, it is believed, a speed of about seven miles an hour could be kept up night and day—electric lights being used by night. The business of such a canal would be very large. There would be 38 locks required and a depth of 27 feet of water, sufficient to float the largest merchant ships, and even the most of armor-clad warships. It would have been far better for De Lesseps and France if he had devoted his energies to such a home-work instead of wasting them, as he has probably done, in his Panama canal.

TURNING THE ALLEGHANY RIVER.—John McLaren, a Pittsburg lawyer, has suggested a novel scheme to the authorities of Pittsburg and Alleghany City. He wants to turn the Alleghany river from its proper channel. The river separates the two cities. Mr. McLaren's plan is to have the Alleghany leave its proper course at Sharpsburg, north of Alleghany City, wend its way through the valleys back of Alleghany, and join the Ohio river at Jack's Run. Geologists are credited with saying that this was the original course of the river. The change would make a tract of land about a mile wide and seven miles long through which the streets of Pittsburg and Alleghany could be made to connect. Twenty years ago a civil engineer suggested this idea and made plans for carrying it out, with the proviso that he was to receive a portion of the new-made land.

A NEW MEXICAN RAILROAD PROPOSITION.—Among the numerous railway enterprises which continue to be made public, one of the most ambitious is that of the Mexican Pacific, which contemplates a line from San Diego, Cal., southeast to the Gulf of California, thence south along the coast to Mazatlan and thence to the City of Mexico, a total distance of some 1900 miles. Such a line would run through regions abounding in coal, valuable woods, cotton and woolen manufactories and many other sources of traffic, while it would reach a vast population to whom a railway is unknown.

THE ELECTRIC LIGHT IN GERMANY.—Tests have recently been made in Germany with the electric light for night firing. The targets were placed 400 meters from the rifleman, and the powerful light 200 meters behind the position of the rifle. The results were most satisfactory, nine out of ten shots fired hitting the target. The electric light is making great progress in Berlin, the number of lamps now in use there being about 25,000, against 850 at the end of 1886.

THE DANISH SOUND TUNNEL has found a successor in the shape of a projected bridge across the sound at its narrowest place, between Elsinore in Denmark and Helsinborg in Sweden. The distance is a trifle over three miles and the greatest water depth only 70 feet.

RAILROADS IN SIBERIA.—A powerful American syndicate is about to be formed for the purpose of building roads in Siberia. Besides a large subsidy, the Government will give $3,000,000 yearly for the transportation of mails and convicts.

RAILROAD INCREASE LAST YEAR.—A total of 5790 miles of new road was added to the railroad system of the United States last year.

TABLE OF CONTENTS.

EDITORIALS.—A 40-Inch Telescope; Underground Telegraphing, 71. Passing Events; Annual Mining Review, 78-82.

ILLUSTRATIONS.—Drilling at the Face of the Drift; At the Mouth of the Tunnel, 71. Fig. 1.—Suspension Hoist for Quarries; Fig. 2.—General Arrangement of Double Cable Suspension Hoist for Large Open-Cut Workings, 73.

CORRESPONDENCE.—Value of Montana's Product; White Oaks, New Mexico; Mines and Mills Near Kernville; That Lake of Volcanic Glass, 72. Washington Territory Mines, 73.

MISCELLANEOUS.—Suspension Hoists in Mining, The Water Walker; Monkeys as Coin-Testers; Why Tinware is Cheap; Reducing Ores on the Comstock, 78.

MECHANICAL PROGRESS.—A Good Mechanical Suggestion; An Embroidery Machine; Transmission of Power by Cable; Another Reported English Discovery; A New Padlock; A Great Invention; A New Toothed Wheel, 76.

SCIENTIFIC PROGRESS.—The Reason Why; Sound, Light, Etc.; Fish Gills; Saccharine as a Substitute for Sugar; Photographing Rifle Balls; Use of the Beaver's Tail; Still Another Alleged Improvement in Telegraphy; Birds as Ventriloquists; Early Food Use of Oysters; Another Comet Discovered; Exploring Central China; A Luscious Spring, 76.

USEFUL INFORMATION.—Why Pianos Get Out of Tune; Difference Between Wool and Hair; An Economical Contrast; A Point in Stone Breaking; Testing Roof Slates; Breaking Up Ships; A Good Example; The Law About Postal-Cards; Peach Stones for Fuel; Blinders for Horses, 77.

GOOD HEALTH.—Health of the State; Continued Evidence of Cancer Cures; The Cause of Boils; Tobacco Smoke; A Poison Stopper, 77.

ENGINEERING NOTES.—Slipping of Locomotive Wheels; Turning the Alleghany River; A New Mexican Railroad Proposition; The Electric Light in Germany; Railroads in Siberia, 77.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 74-5.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 86.

Passing Events.

A double edition of the MINING AND SCIENTIFIC PRESS is published this week in order to make room for our annual review of the mining industry. This number is a good one for our readers to send to friends, and also to file for reference.

The idea of having a State Commission on Mining Debris, as proposed by a bill in the Legislature, does not appear to meet with the approval of the members from the mining counties, who think the Government Commission now at work will do all that is necessary toward investigating the subject.

The public mind is agitated just now over the difficulties in the Samoan islands and the possibilities of trouble with Germany. Work is being hastened on the warships building in this city and elsewhere in case they should be shortly needed for service in the South Pacific.

All over this coast a rapid industrial development is going on. New factories, workshops, and other industrial establishments, are being started in the many growing cities and towns, and much capital is being invested. These are adding largely to our industrial population, greatly to the benefit of the country.

Annual Mining Review.

Operations and Conditions of the Industry in 1888.

The mining industries and interests of the past year have throughout all our Pacific States and Territories been fairly prosperous. The output of bullion amounts for the year to $114,341,592, being the largest annual product ever made by $9,695,633. On this product the net profits have also been larger than usual—a result due to causes that will further on be pointed out.

While the bullion product has been so considerably increased, this increment does not denote the most significant gains of the year. These consist in the greater caution, economy and generally improved management that have marked the business of mining. In this respect satisfactory advancement has been made in every section of the country and in every department of the industry.

Although the past year has not been distinguished by any great mineral discoveries or other specially notable events, it has not been lacking in enterprise and progress. During no preceding year has more attention been paid to mining nor more money been put into the business with a view to reaching practical results. The spirit of speculation has year by year been subsiding, until it seems now hardly more rife in this than in several other leading industries. Compared with operations in oil and railroad shares, deals in wheat, or even with real estate ventures, mining for the precious metals seems a staid and sober pursuit. The business of speculating in mining stocks has everywhere dwindled to small proportions, so small on this coast that they no longer work here any grave mischief.

Output of Bullion in 1888.

As embodying the most reliable information on the subject we present here the report of J. J. Valentine, general superintendent of Wells, Fargo & Co.'s express, showing the bullion product of the Pacific Coast during the past year:

STATES AND TERRITORIES.	Gold dust and bullion by express.	Gold dust and bullion by other conveyances.	Silver bullion by express.	Ores and base bullion by freight.	Total
California	$9,100,093	$ 916,008	$ 652,652	$31,304,725	$42,073,478
Nevada	2,810,566	100,000	6,938,530	2,570,805	12,419,901
Oregon	691,112	30,000			721,112
Washington	94,112	820,000		120,000	1,034,112
Alaska				820,000	820,000
Idaho	2,685,000		3,700,000	8,695,000	15,080,000
Montana	6,100,000		11,600,000	22,276,000	39,976,000
Utah	277,720		3,479,138	3,500,383	7,257,241
Colorado	3,100,000		17,725,100	6,930,400	27,755,500
New Mexico		50,000	183,641	2,782,040	3,015,681
Arizona	712,610	100,000	860,788	3,460,470	5,133,868
Dakota	2,300,716	100,000	468,216		2,868,932
Mexico (West Coast of)	9,00		1,196,673		1,205,673
British Columbia	479,400				479,400
Totals	$27,622,020	$2,116,008	$46,598,738	$83,004,896	$114,341,592

The gross yield for 1888, shown above, segregated, is approximately as follows:

Gold	26.65	$30,468,052
Silver	47.53	54 348,420
Copper	15 97	18,261,490
Lead	9.85	11,263,630
Total		$114,341,592

In regard to the probable accuracy of the above tables and the increasing difficulty of obtaining exact data on this subject, Mr. Valentine remarks as follows:

"The facilities afforded for the transportation of bullion, ores and base metals, by the extension of railroads into mining districts, increase the difficulty of verifying the reports of the products from several important localities. Especially is this the case in the reports from Colorado and Montana. And the general tendency is to exaggeration when the actual values are not obtainable from authentic sources; but the aggregate result as shown herein we think may be relied on as being approximately correct."

Mr. Valentine also furnishes a statement of the annual product of lead, copper, silver and gold in the States and Territories west of the Missouri river from 1870 to 1888 inclusive:

YEAR.	Production as per W. F. & Co.'s statements, including amounts from British Columbia and west coast of Mexico.	Product after deducting amts from British Columbia and west coast of Mexico.	The net products of the States and Territories west of the Missouri river, exclusive of British Columbia and west coast of Mexico, divided, is as follows: LEAD.	COPPER.	SILVER.	GOLD.
1870	$ 54,000,000	$ 52,150,000	$ 1,080,000		$17,220,000	$33 750 000
1871	58,284,000	56,784,000	2,100,000		34,398,000	34,177,395
1872	62,236,269	60,831,324	2,250,000		27,453,302	38,460,458
1873	72,536,603	70,130,863	3,450,000		39,968,194	39,066,558
1874	74,401,045	71,965,610	3,800,000		42,896,935	38,177,395
1875	80,889,067	76,703,433	5,100,000		31,635,239	39,202,424
1876	90,675,173	87,219,859	6,040,000		39,202,424	44,896,935
1877	98,421,764	96,811,582	6,785,250		44,896,935	45,846,109
1878	91,154,922	79,458,587	4,482,000		37,285,857	37,976,080
1879	93,187,036	77,239,512	5,742,200		34,038,057	37,976,080
1880	93,187,036	84,604,417	5,742,200		34,038,057	37,976,080
1881	84,604,417	81,198,474	6,361,002		42,987,613	30,653,959
1882	92,411,835	89,207,549	8,008,155		48,139,039	29,011,318
1883	90,313,612	84,633,212	8,163,550		42,975,101	27,816,640
1884	84,976,954	81,633,395	6,384,091		43,529,925	26,158,567
1885	90,181,260	87,321,382	8,662,991		44,516,599	29,393,756
1886	103,011,701	100,160,222	9,136,192		59,158,851	29,561,424
1887	104,646,519	103,327,770	9,631,073		60,383,854	32,500,687
1888	114,341,592	112,666,569	11,263,630		55,153,747	29,987,702

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, $25,793,207; from Marseilles, $1,128,688; from Venice, $———; from San Francisco, $14,621,431. Total, $41,543,326, as against $43,006,618 last year. Pounds sterling estimated at $4.84.

Comparing the bullion product of 1888 with that of the preceding year, the following losses and gains have, according to Mr. Valentine's reports, taken place: Montana has gained $6,892,725; Colorado, $3,462,500; Nevada, $2,073,150; Idaho, $445,000; west coast of Mexico, $434,588; and Alaska, $211,000. The losses are: California, $1,599,455; New Mexico, $1,019 956; Arizona, $647,682; Oregon, $248,434; Dakota, $114,673; Utah, $80,489; British Columbia, $76,754; and Washington, $35,888, the aggregate gains amounting to $9,695,633.

Comparing the gold product of these two years, there is seen to be a falling off of $3,607,970, while the value of the silver product has been increased $2,770,302; of the lead, $1,632,557; and of the copper, $7 893,744, the most notable feature of these statistics being the largely increased value of the copper product, caused by the late remarkable advance in the price of that metal.

CALIFORNIA.

While the bullion product of California has so fallen off during the past 12 months, she still remains much the largest gold-producer of any of our States or Territories, her output of that metal last year being nearly twice as much as that of Montana, the next largest gold producer on the list.

The largest portion of our gold now comes from the quartz mines. The quartz mining industry was never in a more flourishing condition than now in California. Ore is being worked very cheaply, and the business is conducted on closer and better principles than formerly. It would be impossible in the brief space at our disposal to give consideration to the very many individual quartz mines in the State, and as we have given weekly reports concerning them in our "Mining Summary," it is scarcely necessary.

Of these the year under review has been prolific, there being no branch of mining but has had its full complement of novelties and inventions. Every method, implement and appliance employed in ore extraction and reduction has been revolutionized or radically improved, if the claims of innovators and inventors may be admitted as tenable; and that material progress has been made in this direction cannot be denied. In almost everything some betterments are to be noted—in the rock-breaker and ore-feeder; in the crushers, mortars and amalgamators; in the roasters, concentrators and settlers; in the water-wheels and other motors, more especially in the application of electricity to the transmission of power and the propulsion of machinery. While a few of these new methods and devices have been devoid of merit or of doubtful value, the majority of them have proved of unquestionable utility, a few of the first importance, the gains they have worked to mining being vital and permanent. As will naturally be inferred, the number of patents issued for this class of inventions has, during the past year, been unusually large.

Drift Mining.

This branch of placer mining continues to be confined almost wholly to California, it being here only that the deposits adapted to be worked by this method are found on a large scale. Of the placer gold produced in this State, nearly one-half, since the general suspension of hydraulic mining, is obtained by drifting. The latter has, in fact, since, and partially by reason of the suspension of hydraulic operations, received a decided impetus.

The Forest Hill divide, Placer county, the Butte creeks, and the Magalia district in Butte county, and the vicinity of Bald mountain in Sierra county, continue to be the sites of the principal drift operations in California, the business in the first-mentioned locality having, during the past year, undergone a considerable expansion. In nearly all the central and northern counties more or less drift mining is practiced, very little being carried on south of Calaveras county. For exploiting this class of deposits several long tunnels have lately been run, one of these driven by the Mayflower Company on the Forest Hill divide, and but recently completed, having a length of 5000 feet. The Breece & Wheeler tunnel, in the same neighborhood, is 7000 feet long, while the tunnels driven in the Mountain Gate and Hidden Treasure mines, further up the divide, have each a length of 8000 feet, there being elsewhere in the State several of these structures equally long. The cost of driving these tunnels ranges from $6 to $15 per linear foot, the average cost being about $10.

While the gravel now being extracted from the Breece and Wheeler mine yields at the rate of $9 per carload of one ton, this is more than three times as rich as the average throughout the State, and much above the average grade heretofore taken from this mine. Though the Mountain Gate and the Hidden Treasure affords each a large amount of material, it does not, taken all together, yield over $2.50 per carload.

The number of men employed in this class of mines varies from half a dozen or less to 150. Very few of them, however, employ over 100 hands—generally about 20 or 30. The number of carloads taken out daily ranges from four to eight per man, the average being about six. A good deal of this drift gravel has to be crushed with stamps before the gold can be recovered from it. This class of material is, however, apt to be rich, rendering its reduction profitable notwithstanding the increased cost of working it.

Hydraulic Mining.

Of this branch of mining, once a productive and profitable industry in California, very little can now be said, since its suppression throughout so large a portion of the State by legal process. In the northern counties, however, where the business has been suffered to go on without impediment, it has not only prospered, but undergone steady enlargement for several years past. The field of its now active and successful operations covers in California the counties of Siskiyou, Trinity and Del Norte, it being pursued also on sufferance and mostly in a small way at a few other localities in the State. There is as much hydraulic gravel in these three counties as in any other of like number in California, the larger of these deposits lying along or adjacent to the principal streams that traverse this section of country. These streams consist of the Trinity, Scott, Klamath, Smith and Salmon rivers and their tributaries, of which they have a great number. Next to the Sacramento and the San Joaquin the Klamath, below its junction with the Trinity, its largest confluent, carries more water than any other river in the State. But notwithstanding their heavy flow, none of these rivers are navigable, even for craft of the lightest draft. They are, in fact, rocky, tortuous, swift-flowing streams, incapable of being navigated even by an Indian canoe.

Of these rivers, only two, the Klamath and Smith, empty directly into the ocean, the others being all confluents of the Klamath, the mouth of which is so impeded by a bar that no sea-going vessel could enter it, were any portion of the stream above navigable by such craft.

The hydraulic deposits in this portion of the State differ in many respects from those found in the counties along the main gold belt farther to the south. The gravel in these northern counties, while it is of good grade, is for the most part free from volcanic or other barren matter, and generally so little impacted that it can be broken down and disintegrated with the hydraulic pipe, recourse to powder for this purpose rarely ever being necessary. The gold occurs here so generally diffused through the gravel that the value of the latter can, while yet in place, be calculated with considerable closeness. Not often are bedrock tunnels here required for opening up the deposits, the most of which occur in the form of benches having a considerable elevation above the outletting streams, a position that insures ample fall for disposing of the tailings.

Invited by these favorable conditions, a good deal of capital is now being invested in hydraulic operations in this portion of the State, several large enterprises of this kind having during the past year been inaugurated in the three counties mentioned. Negotiations for other of these properties are now in progress and likely to be consummated, having been examined and favorably reported upon by competent experts. Should sales follow, these properties will be supplied with water and equipped with first-class plants, insuring a largely increased output of gold from that very promising hydraulic district.

From the commission now in session to inquire into, consider and pass on the debris question, the hydraulic miners feel that they have something to hope. That these very capable gentlemen will be able to see their way to some measure of partial relief at least, there is every reason to believe. Whatever conclusions

the commission may reach, while they may not be wholly determinate, they will go far toward settling this much-vexed question at rest, even though adverse to the miners.

River-Bed Operations.

River-bed, like drift-mining, is not much practiced outside of California. In this State the principal sites of these operations are in the northern counties, though something is being done in this line of mining along most of the large gold-bearing streams in the central and southern counties, where the business is largely in the hands of the Chinese, the river-beds here having been worked over so often and so thoroughly that they will no longer remunerate white labor.

In operating by this method the water is diverted wholly or in part from its natural channels, the beds of which being thus laid bare, are dug up and washed in sluices for the gold they contain. Some of these operations are of great magnitude, the most extensive being conducted along the Scott, Klamath and Salmon rivers in Siskiyou county, where some of them have been in progress for 20 years or more, employing, during the busy season, which reaches from July to November, from 50 to 100 men each.

The past has been a good year for this class of miners, the water in the rivers having fallen to a low stage earlier than usual and so remained until late in the fall, thus insuring to these miners a long working season. As a result, many exceptionally large cleanups have been made, the most of them along the Siskiyou rivers.

Quicksilver.

As will be seen by the annexed table, prepared by Mr. J. B. Randol, the quicksilver product has fallen off in the past year. There are only nine or ten mines now operating in California. Some new furnaces have been put up on a mine in Oregon, and a small production has been made. The California production for the past three years was as follows:

MINES.	1886.	1887.	1888.
New Almaden	18,000	20,000	18,000
Aetna	3,478	2 694	959
Napa Con	1,769	2 880	1,065
Great Western	1,049	1,446	625
Sulphur Bank	1,449	1,890	2,164
New Idria	1,401	1,490	1,320
Great Eastern	735	689	1,151
Redington	409	673	126
Guadalupe			
Bradford		1,543	3,848
Various	786	455	992
Total, Flasks	29,881	33,760	33,250
Lowest price per flask	$ 32.00	$ 36 50	$ 37.00
Highest price per flask	39 00	48 00	48.00
Average price per flask	35.50	42.25	42 50
Total value, at av'ge price	1,060,000	1,425,000	1,415,000

Salt.

The receipts of Liverpool salt at this port last year aggregated 8,768,009 pounds, against 13,362,167 pounds in 1887. The falling off in the importation is due to two causes: First, high cost of salt abroad and high freights; second, to a decided improvement in the quality of the California product through solar evaporation. The consumption of Californian has grown to about 30,000 tons, equal to 60,000,000 pounds. Probably the purest salt put up here is that where solar evaporation is on planked floors. To understand this better, we cite the Union Salt Company's mode of evaporation. The company has eight acres of land covered over or planked with matched and planed boards on which the salt is spread instead of on the ground, as is generally done. They also have elevated vats. By their method of treatment the salt is purged of all gypsum, lime and other impurities and made purer than the best imported. Prices of California salt are regulated by a combination of the manufacturers and made so low as to cut off all importations outside of Liverpool salt, and this latter is in a fair way of being entirely shut off owing to a combination of manufacturers abroad, advancing prices, and also to the high cost of freights from Liverpool to this coast.

Chrome Iron Ore.

From Messrs. Kruse & Euler of this city we obtain the following:

But little can be said of chrome iron ore for 1888. The tariff discussion in Congress and the attempts to place it on the free list, had the effect of causing active operations on the Pacific Coast to almost entirely cease; it having been protected by a duty of $3 per long ton on all imported ores. Exports from California were reduced to 1500 tons, against 3000 tons in 1887, and 2000 tons in 1886.

The Tyron Mining Co. of Baltimore being assured that the duty will not be removed, have resumed active operations in Del Norte and Shasta counties, and we hope that in a short time the Pacific Coast will be able to supply the demand for the whole country, to the exclusion of imports from the Mediterranean of both the mineral and its products.

To show how deeply these imports affect our home industry, we give the following from "The Report of the Geological Survey of the Department of the Interior" on the mineral resources of the United States:

In 1886 there were shipped from California to the manufacturing centers at the East, 2000 tons at an actual cost in California of $15 per ton, while to the same markets there were imported for the same year, 1,985,809 pounds of bichromate of potash, equal to 2000 tons of ore, at an invoice cost of $7 per ton, and 3356 tons of ore, invoice cost $13 per ton, equal to 5356 tons of ore, or a total value of $182,949.

The latest Government report, 1887, gives the imports as follows: Bichromate of potash 1,722,465 pounds, equal to 1600 tons of ore, value $120,305, and 1404 tons of ore, value $20 812. The report for 1888 will show about the same proportion.

Borax.

Of this salt there was received in the City of San Francisco during 1888 a total of 7,589,000 pounds, which amount very nearly represents the product of the Pacific Coast for the year. Shipments from this point amounted meantime to 6,865,800 pounds. As compared with the preceding year the product of last year shows a falling off of nearly three and a half million pounds, the result of a combination entered into by our home companies toward the end of 1887, with a view of restricting and otherwise regulating production. By reason of this movement expenses have been somewhat curtailed and better prices realized, rendering the business fairly profitable, a condition it had not before attained for many years. Refined borax is now selling in this city at 7½c per pound wholesale, the price here being less than in New York by the cost of transportation, a little more than one cent per pound.

The companies now operating on this coast, all in California and Nevada, are the San Bernardino, the Pacific Salt and Borax, the Teale's Marsh, and the Nevada Salt and Borax. The Harmony Company, formerly owned by Wm. T. Coleman, having been idle most of the past year, no new companies have entered the field, nor have any new sources of supply been discovered during the past 12 months.

NEVADA.

Wells, Fargo & Co.'s bullion statistics credit the State of Nevada with a product in 1888 of $12,305,603, which is a very good showing. One district alone, the Comstock, furnishes the larger proportion of this. The bullion and dividend record of leading Comstock mines for 1888 is as follows:

	Bullion.	Dividends.
Con. Cal. and Virginia	$4,877,345	$1,188,000
Confidence	977,387	174,720
Gould and Curry	58,117	.....
Challar	86,360	.....
Hale and Norcross	$40,026	224,000
Potosi	107,625	.....
Savage	334,832	.....
Seven other mines	137,777	.....
Totals	$7,419,469	$1,586,720

The discount on the silver product of the California mine for the year was over $650,000, or enough to pay six of the usual monthly dividends of 50 cents per share. An effort is to be made to reduce the cost of milling ore at this mine and thus utilize a large amount of low-grade ore.

This record for the year is pretty good for a "camp" that is often styled a "played-out" one. The leading mine produced nearly five millions. In any other region there would be a great deal of talk about this. The prospect that the yield of the current year will exceed that of 1888 by about $2,000,000 is flattering, even if no further ore discoveries should be made than are now developed. There are now 12 bullion-producing mines on the lode, and that number will be increased to 15 and probably 18 before the middle of the current year.

The Virginia *Chronicle* gives figures slightly different from those above quoted. That paper says: During the year 1888 a total of 280,500 tons of ore was extracted from the Comstock mines, yielding bullion valued at $6,500,000. The total cost of extracting this ore and handling it until the bullion was taken out was about $3,640,000, or at the rate of about $13.50 per ton. The Sutro Tunnel Company derived about $280,000 in royalties on the ore. The Virginia & Truckee railroad received about $250,000 for hauling a portion of it to the mills on the Carson river. The stamp-mill owners derived nearly $2,000,000 for crushing the ore, and it is safe to say that about $1,000,000 of this was clear profit, and this profit would have been much larger had it not been for costly changes and improvements which it was necessary to make at some of the mills. The silver portion of the bullion produced was subject to a heavy discount when sold.

The total bullion yield of the lode from June 30, 1875, to Dec. 31, 1888, was $149,999,777. During that period the lowest yield was in 1881, when the total product was $1,399,428, and the highest in 1876, footed up $43,693,833. There is no record of the yield prior to the last two quarters in 1875 in the Recorder's office, as the bullion tax law did not take effect before that date. From the best information obtainable of local secretaries, the total bullion yield of the lode from its discovery until the present date will exceed $500,000,000, counting the assay value of the ore crushed, only 50 per cent of which was saved until about 1874.

As showing the value of ore, etc., some figures from the leading mine will be of interest. The official returns of the ore worked and bullion produced for account of the Consolidated California and Virginia mine during the month of December were received with the closing shipment for the month. There were worked at the Morgan mill 4825 tons of ore, yielding bullion of the assay value of $110.497.97, of which $55,502.53 was gold and $55,994.44 was silver. The average yield of the ore per ton in bullion was $22.90, and the average assay value of the battery samples was $28.27 per ton. There were worked at the Eureka mill 6370 tons of ore, yielding bullion of the assay value of $149 822 59, of which $77,204 20 was gold and $72,618 39 was silver. The average yield of the ore in bullion per ton at this mill was $23 52, and the average assay value of the battery samples was $30.48 per ton. There were worked at both mills a total of 11,195 tons of ore, yielding bullion of the gross assay value of $260 320 56, of which $132,706 73 was gold and $127,618 33 was silver. In addition, there was produced from the assay-office cleanup for 1888 from granulations, bullion valued at $1389 34, and from ashes, sweepings and slag, bullion valued at $5921 37, making a grand total of $267,631.27 produced and shipped for the month of December. The average yield of the ore in bullion per ton was $23.25, of which $11 85 was in gold and $11 39 was in silver. The average assay value of the battery samples was $29 53 per ton. It is worthy of note that the proportion of gold contained in the Consolidated California and Virginia bullion produced in December exceeded that of the silver. This made a material gain in the profits of the company.

Tuscarora district came quite prominently to the front during the year, being next in importance to the Comstock. The district contains a network of small veins of very rich ore, and there are vast quantities of low to medium grade ores. These last named ores constitute the backbone of the district. They cannot be properly or profitably worked by the ordinary stamp and pan process. The leading mine-owners, however, have erected concentrating works which are now in successful operation. By concentrating the low-grade ores, a high percentage of the metal is saved, and there is profit in thus treating them. So successful has this profit become that larger works will be erected during the year. The milling facilities of the district are constantly being increased. There is now an abundant and never-failing supply of water.

The Tuscarora mines for the year 1888 produced bullion as follows:

North Belle Isle	$564,955 03
Nevada Queen	207,908 20
Grand Prize	103,897 84
Commonwealth	71,062 69
Navajo	61,030 91
Total	$1,008,854 72

During the same period, North Belle Isle has disbursed in dividends the sum of $200,000.

Following is the bullion and dividend record of certain Nevada mines for 1888:

	Bullion.	Dividends.
Commonwealth	$71,063	.....
Grand Prize	103,898	.....
Navajo	61,031	.....
Nevada Queen	207,908	.....
North Belle Isle	564,955	$200,000
Tuscarora district	$1,008,855	$200,000
Eureka Con	478,243	75,000
Mt. Diablo	422,487	40,000
Paradise Valley	75,000	.....
Totals	$1,984,485	$315,000
Comstock mines	7,419,469	1,585,720
Totals	$9,404,054	$1,900,720

This is a good exhibit for Nevada, but it does not show the full amount of bullion produced in that State last year.

Eureka district has had a bad setback, due to the Government suits against the mines for timber used. The furnaces have shut down, and the recent efforts to start them up again under lease have failed.

Work has been resumed in the old Raymond & Ely mine, at Pioche, Nev., by the Pioche Consolidated Mining Company. The shaft is to be overhauled and retimbered from top to bottom and the Cornish pump put in working order.

The districts along the line of the Carson & Colorado railroad have not shown up as well for the year as was hoped. The great need in that region is reduction works.

There are many districts in the State which badly need the aid of capital. There are many hundreds of good mines being worked in a small way which should be properly opened and developed. There is no part of the coast which offers better inducements for capital than Nevada, but miners without means are unable to do very much. Money has gone into the larger districts, to some extent, but the less prominent camps are working out their own fortunes with little assistance from the outside. Montana amounted to little until it had the aid of capital, and now it stands at the head in mining affairs.

The big mining men have gone into Comstock stock and milling deals more than has been good for the rest of the State, and it seems difficult to attract the attention of capital outside the two principal camps of the State. Transportation facilities are not good, and Nevada will not advance much until these are extended. Scores of mining districts now comparatively obscure would come into prominence were capital to aid them and railroad facilities given.

ARIZONA.

Arizona is credited by Wells, Fargo & Co.'s statistics with a bullion product of $5,123,868 for 1888. The Territory shows fair progress, notwithstanding its famous camp at Tombstone no longer produces as formerly. The Arizona *Journal-Miner* says: The mining industry has progressed to such an extent that it is safe to say that enterprises representing more than a million dollars of invested capital have been begun within the last 18 months in Yavapai county, and upward of 1000 more men are employed in the county than were here one year ago. The large copper producing mines of the United Verde group have been yielding steadily since May last, and it is very likely that the output will increase from now forward. The Congress mine has undergone astonishing development within the last year and has recently been producing for shipment more than 100 tons per month of high-grade gold ore, while the ore in sight in the mine and on the dumps is almost unlimited. The Senator mine has been reopened; very large bodies of rich gold rock have been exposed and the production of hundreds of thousands of dollars assured. Phelps, Dodge & Co. are extensively developing the Copper Basin mines; the Crowned King and Oro Bella companies are pushing their improvements on a large scale; the mill of the Boaz company at Minnehaha Flat is pounding out bullion, and dozens of other promising enterprises are being projected. The sampling works have had to be enlarged in order to properly handle the increased ore shipments, and the progress in all directions is healthy.

The same paper adds: The year 1888 has seen a greater mineral output from this section than any previous year in its history. The estimated shipments of the sampling works of the Arizona Ore Sampling Co. for the year are 2,017,761 pounds, or 1008 tons. The shipments from the Congress amounted to over 600 tons, valued at $105,000, while the Hillside shipped 620 tons, making an aggregate of 2208 tons. Shipments of bullion by Wells, Fargo & Co. for the year amounted to between $150,000 and $160,000, while Tip Top district, which exports its product via Phœnix, reports an output of ore amounting in round numbers to $75,000. The above does not include the shipment of copper bullion and matte from the United Verde mines.

Ex-U. S. Marshal Turner of Globe, A. T., speaking of the copper mines, says: "A man who has a copper mine there, or anywhere now, is lucky. The big Globe mine is employing 200 men and is getting out 50 tons of copper in a day. It would get out 100 tons if they could obtain coke enough at their smelter. As it is, only one of the two furnaces is running.

"The Silver King mine, 25 miles from Globe, yields both copper and silver. There are 300 men working in and about this mine. The copper product from it is heavy, and shipments are being made steadily. Right around Globe there are about 500 men working in the copper mines. The entire city is growing rapidly."

The excitement of the year has been that at the Harqua Hala mines, but there are conflicting opinions as to the merits of the camp.

COLORADO.

Colorado takes second position this year in proportion of bullion product, being distanced by Montana, as our tabulated statement in another column shows. It would be impossible in the brief space at our disposal to make mention of the many districts of this flourishing State or its many producing mines.

Following is the amount and value of the gold, silver, lead and copper mined in Colorado during the past year:

198,627 ounces of gold	$ 3,105,519
18,200,227 ounces of silver	17,025,628
65,529 tons of lead	5,776,552
901,543 pounds of copper	153,347

The product of the different smelting companies in 1888 was as follows:

Omaha and Grant	$8,044,199 53
Boston and Colorado	4,059 213 82
Holden	4,404,641 66
Harrison, Leadville	1,269,588 00
American M and S. Co	1,900,116 00
Arkansas Valley S. Co	2,356 346 00
Manville Smelter	868,176 00
San Juan Co., Durango	777,877 00
Colo. S. Co, Pueblo	1,725,799 00
Pueblo S. and R. Co	2,934 675 00
Philadelphia Co, Pueblo	57,510 00
Total	$24,061,546 00

Leadville is one of the noted mining camps in the country. The bullion product of Leadville for a number of years, according to the local paper, has been as follows:

1869-79	$10,700,000	1884	$12,837,500
1879	10,333,700	1885	12,357,700
1880	15,065 100	1886	13,750,800
1881	13,147 300	1887	12,073,000
1882	17,127,400	1888	11,830,200
1883	15,638,400		
Total			$144,721,100

The product last year consisted of 17,234 ounces gold, valued at $20 67 per ounce; 7,345,575 ounces silver, valued at 93½ cents per ounce, and 82,890,688 pounds lead, valued at 4½ cents per pound. Leadville produces one-third of the American supply. As the average price of silver last year was 8 cents per ounce lower than in 1887, the depreciation made a difference of $587,646 in the returns of the Leadville mines. No new mines were added to the camp last year, though there were some good developments made in old mines.

DAKOTA.

Aside from Dakota's precious-metal mines, she has the only tin mines in the United States except those of California. The trouble has been that capital seems loth to take hold of the tin claims and open them. Efforts are being made to obtain financial aid from England. Thos. H. White of Deadwood, now in California examining some mines, has this to say concerning the mining interests of Dakota:

"A material change has taken place in the Black Hills. R. H. Clark of Cortez, Nev., was induced by a lot of us in Deadwood some time ago to come there and establish his leaching

works. They are now completed at a cost of $75,000, and are just commencing work on the silica-gold ore that, up to this time, has been refractory. This ore is plentiful and runs about $25 per ton.

"The product of the Deadwood district in 1888, or of Dakota, which is the same thing—for all the mines are within ten miles of Deadwood—was $1,750,000. The principal mines are the Homestake and Caledonia, at Lake City, four miles away from Deadwood and connected by a railroad which has been built this year. Three miles beyond this is the gold region I first spoke of. Large ore bodies have been found in both the mines I have named, the former of which is owned largely by Senator Hearst. The stock of the Homestake two years ago was weak at $10 and $10 50. Now it is $13 50 and $14 strong, and it pays 20 cents per month regular dividends, and will for 20 years to come. The stock of the Caledonia 2½ years ago was selling at 70 cents, and not a pound of ore was in sight. Now it is worth from $3 to $3.50, and is paying 5 cents per month dividends, and they expect $10. Machinery and tunnels to the amount of $100,000 have also been paid for. Twenty stamps have been added to the stamp-mill, making a total of 50 in use.

"The town of Deadwood is bristling up. The Fremont & Elkhorn Valley railroad is now within eight miles of it, and people don't have to stage 200 miles, as they did formerly, from Sidney. New people have come in. The Harney Peak tin mines are now to be prospected, something which should have been done in the first place. There is very good tin there, but as yet the trouble is there is not enough of it."

MONTANA.

Montana this year takes first place in bullion product over all other States and Territories.

It is impossible in this brief review to make even mention of the many producing mines. There are now 1120 stamps running in the Territory, and the 12 smelters have a combined capacity of 5280 tons per day. The Anaconda smelters alone can handle 3500 tons of ore per day. This last-named mine is now the leading copper-producer in the United States. This company will soon construct 30 miles of railroad of its own between Butte and Anaconda, exclusively for the transportation of ore from the mines to its smelters.

The Butte *Miner* gives the following as the metal output of Butte for the year 1888, as nearly as it can be ascertained from official and semi-official sources. In several instances the sums are estimated, but, if anything, they are lower rather than in excess of the actual product. The increase, as compared with the product of 1887, is over $6,000,000.

Silver by Pacific Express Co., Butte	$ 4,334,000
Silver by Pacific Express Co., Anaconda	300,000
Anaconda—100,000,000 lbs. copper matte, estimated	7,450,000
Anaconda silver in matte, estimated	1,250,000
Parrot, fine copper, 12,000,000 lbs.	1,500,000
Boston & Montana Co., 14,425,554 lbs. copper	2,527,000
Colorado smelter, silver and copper	750,000
Butte sampling Works	250,000
Clark's Butte Reduction Works, 5,500,000 lbs. copper fine	715,000
Gold and silver in matte, Clark's Reduction Works	610,000
Silver in matte from all other sources	1,250,000
Placer mines	100,000
Ores shipped direct to outside smelters	600,000
Total	$22,937,000

"In addition to the Butte output, as given above, a low estimate of the product of the mines in the other parts of the Territory, made by experts, places it at $17,500,000, which will make a grand total of $40,437,000." On another page of the same paper the output is given as $34,000,000. The figures, as given by Wells, Fargo & Co., are $32,376,000. The *Inter-Mountain* places the output at between $30,000,000 and $35,000,000. On another page of the PRESS a correspondent has also something to say on the subject.

The December reports from dividend-paying mines in Montana bring the record for the year 1888 up to $3,318,600. This excels any previous year in the total amount of dividends declared.

Boston & Montana (copper)	$ 900,000
Granite Mountain	1,200,000
Hope	50,000
Houston	6,000
Jay Gould	100,000
Montana Limited	334,000
Parrott	146,000
Original	6,000
Hecla Con.	176,000
Total	$3,318,000

IDAHO.

H. F. Wild, assayer in charge of the United States Assay Office at Boise City, Idaho, gives an estimate of the product of gold, silver and lead in Idaho, by counties, during the year, as $9,467,443, of which $2,552,269 was in gold.

The Yankee Fork country was comparatively quiet during the past year, but it is in excellent shape for future increased operations. The Salt Lake *Tribune* gives in a condensed form a summary of operations in this Territory, from which we make extracts:

There was much activity at Rocky Bar during the last year. The Alturas Gold Limited Company kept its 50 stamps running much of the time, and has pushed development ahead in the mine.

At Atlanta considerable ore was extracted from one or two old properties which have been idle for several years, and the camp has prospects of activity again at an early date.

Pine Grove is a new district 20 miles south of Rocky Bar on the road to Mountain Home. It is also a gold district. A number of lodes were opened to considerable extent, the largest being by a St. Louis company.

In the Wood River country the decline on lead and silver and the cost of transportation had the effect of stopping production, but about September a reduction in freight charges was made by the railway company, which caused active work to commence again.

The Hailey and Bellevue Sampling Mills handled during the year 6,033,423 pounds of ore.

Considerable progress was made in Smoky district in development work.

The Sawtooth country was almost dormant, except the Silver King, which worked a good force and shipped much rich ore, the property being under lease to Hyndman & Co.

Sea Foam is a new district located 15 miles north of Ketchum, the nearest point. It attracted many prospectors, who pretty well staked out the country, which shows fine surface indications and gives promise of good mines as soon as the country is made more accessible.

Following down the Salmon, we find the country about Clayton very prosperous, with the Clayton smelter making a steady run, sending out more bullion than ever before and shipping large quantities of high-grade ore. The Bay Horse smelter and concentrator did a larger business than ever, while the mines in that locality have greatly improved.

The Owyhee country took on new life during the year. Early in the year Mr. Kemp Van Ee became so impressed with the camp as to investigate its ledges, and this resulted in the purchase of two groups of mines, each having 12 or 15 claims. In the old Oro Fino rich bodies of ore have been developed, some of which is shipped while the lower grades is worked in the 20-stamp mill, purchased by the Oro Fino syndicate, and since enlarged and improved. The process is that of concentration, instead of the old system of amalgamation. These operations have encouraged others, so that work is progressing on many old claims, and the several stamp-mills have been kept busy since last summer, so that the output for the camp was quite large.

The country north of Weiser, Mineral, Seven Devils, etc., attracted some attention, and a Montana syndicate went to work in the fall on some large copper lodes there.

While mining was crippled the past year by heavy freight and the working charge rates and low prices of lead and silver, there is a more hopeful outlook now.

NEW MEXICO.

New Mexico by no means holds the position as a bullion-producer that she could, provided she had better transportation facilities, and more abundant capital to develop her mineral resources. Long and patient waiting has not as yet brought these things, so badly needed. There are many camps and mines in all directions not nearly as well developed as they should be. The prospectors have opened their claims in the various camps, and more or less of them ship ore, but money is needed for machinery and development. Reduction works, too, are needed. The Silver City *Enterprise* is not satisfied with Wells, Fargo & Co.'s statistics of its gold production, and says:

The Wells-Fargo statistician, Mr. Valentine, credits this Territory with a total of only $243,508 in gold, and this is published broadcast as an absolute fact, even when figures are obtainable, which disproves their own statements.

The Carlisle Gold M. Co. alone, during the year 1888, produced $396,063.35 in gold, which is $152,465 35 more than is credited to the entire Territory by our distinguished friend, Mr. Valentine. East Camp shows a product of $2687, making a total for the Carlisle mining district in gold alone of $398,650, and of silver, $61,677, both of which metals, it is reasonable to infer, were shipped per express. To the above must be added the value of 80,000 pounds of copper matte, which will yield on separation 25 per cent of pure copper, worth at present New York quotations, 17 cents per pound, a total, $340,000. In addition to this the company produced 1,546 900 pounds of lead, worth $3.25 per hundred, $50,374.25, making a grand total of $544,801 25, as the output of Carlisle alone.

Now as to Pinos Altos, we desire to direct the attention of Mr. V. to another fact equally as important, though not quite so extended as those referred to in the yearly product of Carlisle. The Mountain Key mill and mine turned out $114,403, and the Bell and Stevens, $62,799, or from these two mills alone we have a gross output of $177,212, which, added to the Carlisle product, makes $722,013 25, which is nearly one-third the amount—$3,000,000 in gold and silver—which is credited to New Mexico by the Wells-Fargo annual exhibit of the bullion product of the nation.

OREGON.

Oregon only produced last year $701,566 in gold and silver, but many new camps are now being opened which ought to greatly add to this this year. More attention is now being paid to the quartz interests of the State, and some capital is coming in. There are many hundreds of mines still undeveloped. The main mineral wealth of Oregon lies in her coal and iron mines, of which something is said in another column. Many placer claims are being worked successfully, but it is being found that the quartz-mining industry will be profitable when capital is invested. The State is now rapidly being settled up and with the advent of new settlers no doubt these interests will assume more importance. Some of the new camps opened last year have attracted the attention of capital, and Oregon will soon be given more reduction works, which are badly needed.

UTAH.

The year has averaged fairly well for Utah miners. The Salt Lake *Tribune* has an excellent detailed review of operations, from which we condense the following: Park City, the largest mining camp in Utah, moved on steadily the past year. The district now has a population of between five and six thousand people.

Of course the great Ontario stands at the head in magnitude of operations. During the year 1888 its product was:

	Tons.	Value.
Ore crushed	25,000	$850,000 00
Ore shipped	7,700	750,000 00
Totals	32,700	$1,750,000 00

Bringing the product of the camp down to values, the net for the camp would be about this for the year:

Ontario	$1,750,000
Daly	1,000,000
Crescent	198,871
Woodside	75,000
Sundry mines	100,000
Total	$3,101,871

By net is meant the return after paying working charges and freight, all of which should be added to show the actual production of the mines.

The Tintic country made an excellent showing for the year 1888. The two largest mines had been handicapped for three years through vexatious litigations, which kept them back in their development, and also in the quantity of ore extracted and shipped. A compromise was effected in early June, since which there has been more activity.

Fully three-quarters of the silver-lead ore shipped from Tintic went out of the Territory for reduction. The ore shipments for the year were 56,850,800 pounds.

Shipments from Silver City and Ironton in 1888, aggregate 56,850 800 pounds. Of the 5588 tons of iron ore shipped, over 2000 tons went to Butte, Montana.

At Bingham the operations of the Lead Mining Co. the past year were quite satisfactory, their mines having produced in the neighborhood of 13,000 tons of first-class ore, concentrates and roasted product.

The ore shipments from this camp aggregated more than 13,000 tons. The 42 mines shipped in all 13,754 tons.

Stockton, like all lead districts, suffered much from the low prices of lead and silver, which cut down production very much, and also retarded prospecting and development of many claims, and yet much was done in the way of preparation for future operations. The ore shipments from the camp in 1888 over the Utah & Nevada R. R. were 14,103,973 pounds.

New life is being given to Frisco Mining district through the French company reorganization under the title of the Comet Smelting Works Co., and which is backed up by ample capital.

The Great Horn Silver, once the life of the camp, and which has produced its millions in the past, has been conducted on a small scale the past year. During the past year the shipments averaged in the neighborhood of 230 tons per month.

The old Silver Sandstone camp of Silver Reef has moved along quietly. The Stormont runs five of its ten stamps part of the year, crushing about 30 tons of ore per day, which run all the way from 10 to 75 ounces silver per ton. This ore was worked for chloriders, and produced about 40,000 ounces silver.

Last October the Christy Co. met with heavy loss in the burning of the Stormy King hoisting works and the double compartment shaft down 250 feet. The damage has been repaired and the works again started. The company is employing about 80 men at the mine, and a good force at the mill, which produced last year about $200,000 worth of silver.

A table of the bullion product of Utah is given on page 82.

WASHINGTON.

The mineral wealth of Washington Territory lies more in its coal than its precious metals. It is only credited with $124,112 in gold and silver for the year. A number of new claims have been opened, however, during the year. The Conconully district, in the northern portion of the Territory, has silver ores, but the claims are thus far not well developed. The coal output of the Territory was, in round numbers, 950,000 tons, valued at $4,300,000. Of this amount Seattle shipped 450,000 tons, valued at $2,300,000. In another place in this article is given more in detail the yield of the coal mines.

THE *Calistogian* says: A week ago the Chinamen at the Bradford mine went on a strike because they could not get their meat at summer prices. The proprietors at once sent to San Francisco for white men, and in the future intend to run the mine without having the coolies around.

CHINAMEN are not allowed to visit Harqua Hala.

Other Mineral Products.

Copper.

As was anticipated at its beginning, the past year has witnessed an enormous output of copper, the product having not only surpassed expectation, but exceeded all precedent, the increment in this country having been greater than in any other. The remarkable impetus given to this industry was due, of course, to the advance in the price of this metal, which, commencing toward the close of 1887, has since been maintained.

The output of Montana, now the largest copper-producing country in the world, stood last year as follows: The Anaconda mine, 63,245,473 pounds; the Parrott mine, 10,750,000 pounds; the Boston, Montana and Liquidator, 18 273 667 pounds; the Butte Reduction Works, 3 521,565 pounds; various other small mines bringing the year's product up to a total of 95 500,000 pounds against 78 700,000 pounds in 1887.

The Lake Superior mines, formerly the largest copper-producers extant, and now second on the list, turned out last year a total of 86,859,000 pounds; of this amount the Calumet and Hecla made only 2 360,552 pounds, about the quantity here turned out in 1887. In the underground works of this property, for a long time the foremost copper-producer in the country a fire has for the past two years been smoldering, making it impossible to get out any large amount of ore; hence this great shrinkage of production.

The output of the Arizona copper mines last year was as follows: Copper Queen, 9,379,949 pounds; Old Dominion, 4,870,000 pounds; Arizona Copper, 7,133,188 pounds; Detroit, 5,420,224 pounds; United Verde, 3,200,000 pounds; all other mines, 3,196,000 pounds; total, 33,200,000 pounds. The product of Colorado for the year was 3,000,000 pounds; of Utah, 2 500,000; of New Mexico, 2,000,000; all other countries in the United States, California included, 4,960,000.

The production of copper in California was largely increased in 1888 over that of the few years preceding, the low price of ingot ruling in the East and Europe during '85, '86 and '87 having nearly extinguished the copper-mining interest in this State. The formation of the French syndicate of 15 months ago has had the effect of increasing the produce in California, as elsewhere, but the field for a much larger increase is very extensive, as there are many fine undeveloped "locations" on the "great copper belt," which runs N. W. and S. E. throughout the whole length of the State, and the facilities for transportation, fuel and cheap labor in many localities are far superior to those of any of the surrounding States and Territories. Evidently the time will come, perhaps in the near future, when copper mining and smelting, or lixiviation, will become a very great and important industry of the Golden State.

This improvement in the copper market has not only led to a largely increased output from the mines that have been continuously operated, but it has led to the development of new deposits and in many instances to a resumption of work on mines that had long been idle, there having occurred several cases of the latter kind in this State. Among notable examples we have the rehabilitation of the Union mine at Copperopolis, Calaveras county, which, after a long interregnum, has during the past year been restored to an actively productive condition; so also the Napoleon mine in the same county and the Newton in the adjoining county of Amador.

More recently ore extraction has been resumed on the Buchanan copper mine in Fresno county, where some ten years ago a good deal of high-grade ore was taken out and shipped to San Francisco at a handsome profit. On some of the other small veins, of which there are several in the vicinity of the Buchanan, work has been begun, these also carrying ore of good grade.

Besides the high price that copper now commands, the owners of these deposits have been encouraged to commence the work of their development by the prospect of increased transportation facilities through the early construction of the Stockton, Fresno & Southern railroad, the line of which, as surveyed and fixed, runs quite near these mines. When this road is completed the distance the ores here will have to be hauled on wagons will be so shortened that the present cost of delivering them at San Francisco will be reduced more than one-half. Besides the copper interest, the rich and extensive mineral belt that occupies the whole westerly slope of the Sierras will, through the building of this road, be immensely benefited. This belt, which covers an area of more than 2000 square miles, abounds with mineral deposits of almost every kind, gold, silver, copper, lead and iron constituting its more important resources of this kind, for the entire country is as well adapted for fruit and grape growing as any other part of the State, the eastern half of this belt with the much larger area of mountain lands to the east being covered with magnificent forests. To the lumberman, the fruit and the grape growers, hardly less than to the miners, the completion of this road will, therefore, be a great boon.

The principal mines to produce in the State last year were at Copperopolis (the old "Union," which was closed down for 19 years after producing from '61 to '66 over 75,000 tons of shipping ore) re-opened in 1887; at Campo

Seco, the Campo Seco and Satellite (formerly Lancha Plana) mines; and at Ione City the Newton. The Union produced only shipping ore; the last three named copper cement—a manufactured article by lixiviation. The Union and Newton, under the San Francisco management of Col. H. D. Ranlett, have been quite extensively worked. Some 4000 tons of 16 per cent ore from the former were mined and shipped around Cape Horn to Eastern smelting works, and at the latter 50 tons of 80 per cent copper cement were manufactured from old dumps, besides several thousand tons of ores mined and set on fire for leaching this year.

The Campo Seco mines are managed by San Francisco corporations, and produced considerable amounts of copper cement—in all, several hundred tons—and are now mining and setting on fire thousands of tons for the present year's leaching. At Spanceville the old "Dumps," formerly belonging to the San Francisco Copper Company (now working the "Satellite" at Campo Seco), were sold last winter to two employes who have produced quite an amount of cement copper (some 50 or 60 tons) and part of which was smelted at the mine into 98 to 99 per cent bars and used by brass founders in this city. Nearly all the copper product of California goes East for smelting or refining either by rail, steam or the Cape, Col. Ranlett, as representative of Eastern smelting works, shipping the greater part either under purchase or advances. Small amounts of copper cement have also been made at Telegraph City and one or two other points, and some shipments of ore have been made to Liverpool. It is expected the present year's yield of copper will be double that of 1888 for California, which is estimated at about 1000 tons pure of a value in ingot of about $300,000.

In 1887 the Societe des Metaux of Paris, the largest consumers of copper in the world, headed a movement to control the copper output of the world, which led to the forming of a syndicate on July 1st of that year. The market was the more readily controlled owing to its cheapness, Lake copper selling as low as 10¼ cents in New York City. The low prices had induced greater consumption and lessened the production, so that the supply and demand was about the same. The mine-owners readily came into the movement, and favorable terms for three years were made. The price of copper was advanced toward the close of 1887, and continued well up and steady throughout last year, as is shown by the following table of monthly averages for Chili bars by the long ton in London and Lake copper by the pound in New York:

	Chili Bars.	Lake.
January	£ 85	16¼
February	77½	16
March	78½	16
April	80	16
May	80½	16
June	80½	16¼
July	81	16¼
August	80½	16¼
September	80	17
October	100	16½
November	78½	16½
December	77½	16¼
Average year	£82½	16¼

Although the prices last year were the highest on record for many years past, still they are not to such an extreme as to curtail the consumption. The high prices have no doubt stimulated the production, for the supply is said to be steadily gaining over the consumption. In the United States the stock on hand on December 31, 1887, was 40,000,000 pounds, and on December 31, 1888, it was 78,000,000. The *Engineering and Mining Journal* gives the following production in this country last year by States and Territories:

	Lbs.
Michigan	86,850,000
Montana	98,500,000
Arizona	32,200,000
Colorado	3,000,000
Utah	2,500,000
New Mexico	2,000,000
All other sources	4,950,000
Total domestic copper 1888	231,000,000
From imported ores	5,000,000
Grand total	236,000,000

The largest producing mine is the Anaconda of Montana, which last year turned out 63,245,473 pounds. The next on the list comes the Calumet and Hecla of Michigan, with 50,402,000 pounds, which is followed in turn by the Tamarack of Michigan, with 11,411,000 pounds. The largest copper mine in Arizona is the Copper Queen, which turned out last year over 10,000,000 pounds.

The world's product of fine copper in 1888 was 255,357 long tons. These figures have been mainly collated from the delivery-books of the French syndicate, as follows:

	Tons. (2240 lbs.)
Australia	8,000
Bolivia	1,000
Chili	27,000
Cape Copper Company	5,750
Namaqua	1,500
England	1,500
Japan	11,500
Mexico—Bedeo	4,000
Newfoundland	1,481
Norway and Sweden	1,800
Rio Tinto	31,200
Tharsis	10,500
Mason & Barry	6,550
Portugenza	1,200
New Quebrada	2,800
Total syndicate mines	115,784
Germany	16,000
Other mines not included above	18,216
Total foreign product	150,000
American product	105,357
Total copper product, 1888	255,357

The American mines produced 41½ per cent of the world's supply last year. These mines also produced upward of 70,000,000 pounds more than in 1887. It would not be much of a surprise if they doubled that increase this year, which means a product of 100,000,000 pounds more than in 1887. The world's product last year was 60,440,000 pounds greater than in 1887, and the largest ever reported. Ten years ago it was only 150,000 tons. For the past five years it has averaged 227,000 tons.

Silver.

The following table gives the highest and lowest prices by months in 1888 and 1887 in the London market:

Months.	1888 Highest	1888 Lowest	1887 Highest	1887 Lowest
January	41 11-16	41	42	40
February	44	43 3-16	42 13-16	40 1-16
March	43¾	43	43 7-16	41 1-16
April	44	43¾	44	43
May	45	44	44	43 7-16
June	45	44	44	43 5-16
July	45 7-16	42	44 7-16	43 5-16
August	44	41 11-16	45	44
September	44	42 1-16	44 1-16	43 7-16
October	43	42¾	44	44
November	44	42	44 1-16	43 11-16
December	44 11-16	42	44	43 11-16

The range of prices last year was from 1d. to about 2 d. lower in each month than was that of 1887. The causes that brought about the lower values are so varied, and also so well known, they do not require reproducing further than saying that the decline has been going on forseveral years, with a decided dropping within the past half decade, owing to India's necessities causing that country to throw on the London market larger quantities of India council bills, the allotment of which came in direct competition with silver. It is now claimed that by reason of the internal improvements (railroads, etc.) in India being so far advanced, India bills will decrease for two or three years to come, which, if correct, must react in favor of silver. That the falling off in the Indian demand has been felt abroad is shown by the following comparative table of bullion on hand in the principal European banks the second week in 1888 and 1889:

Bank of	Jan. 10, 1889 Gold. £	Jan. 10, 1889 Silver. £	Jan. 12, 1888 Gold. £	Jan. 12, 1888 Silver. £
England	24,170,000	.....	20,610,000	.....
France	40,512,317	18,076,068	43,771,015	17,226,973
Germany	28,078,000	11,200,000	28,078,000	10,920,000
Aust.-Hungary	7,920,000	15,840,000	6,528,000	14,703,000
Netherlands	5,080,000	7,140,000	4,675,000	8,171,000
Nat. Belgium	2,541,000	1,270,000	2,667,000	1,349,000
Nat. Italy	6,918,000	1,085,000	6,083,000	1,118,000
Total this week	109,709,317	88,611,068	111,222,533	85,525,973
Total prev wk.	109,665,145	88,688,116	110,742,378	85,621,383

The above shows a decided increase for the year in silver bullion and a marked falling off in gold bullion. There can be no doubt but the falling off in gold is due to the loans negotiated by Buenos Ayres and Russia, both nations taking unusually large quantities of gold.

The output of silver on this coast is given in another column, but that of the world is not obtainable at this writing. It is quite safe, though, to state that the output was less in 1888 than in 1887. This assertion is based on the low price of silver causing many mines to become unprofitable and therefore their either being shut down or else worked to a limited extent.

This city was last year a more profitable market for silver bullion than was the East, due to the small obtainable supply here and the good Asiatic and India demand. Taking Selby's Smelting and Refining Co. as a guide and the above becomes more convincing, for it is well known that in former years the company was at times compelled to carry large quantities of bar silver for customers, but the past year the parity of prices being so much better than New York allowed of their patrons, who wished, cleaning up each steamer leaving for China. There is a diversified opinion regarding the coast's output this year, but the majority think that there will be no material increase until well into the year, probably not much before fall, when many silver-mining districts, notably the Comstock, will be in good working condition and the bullion probably be produced cheaper. The favorable showing in West Con. Virginia, at Virginia City, caused all the work in the mines on the Comstock lode to be run to the West or Red lode and with every prospect of the best results following.

Coal.

The total production in the world is put at 420,000,000 tons, of which Great Britain's output is 160,000,000 tons, the United States 120,000,000 tons, and Germany 75,000,000 tons.

The development of coal on this coast is making rapid strides, principally in Washington Territory, where there are 180,000 acres of coal lands. For the year ending Sept. 30, 1888, the output of the mines in Washington Territory is officially placed as follows:

Mine.	Men Employed.	Tons.
Franklin	160	181,921
Black Diamond	275	186,532
Roslyn (before strike)	700	231,201
Cedar Mountain	60	32,813
Newcastle	175	168,134
Gilman	185	115,528
Bucoda	78	147,180
South Prairie	100	108,147
New Tacoma	50	43,113
Wilkeson	50	6,930
Totals	2,133	1,133,099

We are unable to give a comparison of the output for the like time ending with Sept. 30, 1887, the only available data for comparison being the fiscal year ending June 30, 1887, for which time the output aggregated 525,705 tons.

Several of the companies only get fairly to work in last year, and, of course, their output will be largely increased in the future. After Sept. 30th Roslyn 3 was developed, and from this mine large quantities of coal are being turned out. The Oregon Railway & Navigation Co. is developing the coal land near Cle-Elum, with every probability that the mines there will be added to the producing mines at a near day.

The output last year of the British Columbia coal mines is estimated by their correspondents in this city as follows:

	Tons.
Wellington	250,000
East Wellington	[illegible]
Nanaimo	[illegible]
Total	340,000

The bulk of the products of these mines seeks this city for a market.

The Coos Bay, Oregon, coal mines output last year aggregated in round figures 62,000 tons.

In this State the only mines turning out much coal are the Empire and Pittsburg, both in Contra Costa county. Their aggregate output last year is placed at 72,000 tons. The Mt. Diablo mine is still shut down. The coal deposits in Livermore valley are being developed. Wells are being sunk in some of the southern counties of this State for coal, but as yet with indifferent success.

For two years the price of house coal has ruled high, with the highest prices reached in 1888, when Wellington sold at $16 to the trade. This high price caused consumers to take to other and less expensive coals. Naturally the increased consumption of other coals caused the prices to be advanced. The high prices invited importations by rail of house coals from the Rocky Mountain collieries to this and the interior central cities, and of New Mexico coals into the southern part of the State, besides stimulating the output of the older mines on the coast and the developing of new collieries. On December 1, 1888, the price of Wellington was unexpectedly dropped to $12 a ton, compelling a corresponding reduction in prices by other coast coal-mining companies, which was followed by a further drop in this month in price by the latter companies. This last decline has shut off the importations of Rocky Mountain coals, owing to the latter costing delivered here $10 a ton. The mild character of the winter, combined with the use of more gas and oil stoves being in use, have had quite a decided effect on the consumption of house coal, which, compared with the like time in 1887, is much less, and this, too, in the face of a larger population.

The consumption of steam coal on this coast has increased to large proportions, and to this, no doubt, is due the ease with which coal values were maintained in 1887 and 1888. The large increase in the number of steam vessels, locomotives and manufactories has been fully 50 per cent the past two years, creating a corresponding consumption of steam coals. For the year 1888 the price of steam coals has been the more easily maintained owing to a three-months' strike of miners in the Australian collieries. Referring to this an exchange says: The long strike in the Australian mines was brought to an end on the 23d of November. It was in force for nearly three months. It will be about the 1st of April before the regularity in the Australian coal supply for this market is fully restored. The supply from Sydney was not interrupted by the strike. There are ten cargoes on the way here from Sydney and six from Newcastle. These cargoes will arrive at intervals in the next 60 days. It is expected that all of them will be here by the 1st of March. This will give us only about 35,000 tons Australian coal in the next nine weeks, or an average of 510 tons per day. Fortunately the yards are too well stocked to have this scant prospective supply from that region affect values. In fact the tendency in Australian coal has been weak and declining for the past few weeks. Several cargoes have been sold in this interval at a net loss to the importers of $1 and upward per ton. The wheat crop in Australia, now about ready to harvest, is quite light, and this will add many more vessels to the coal fleet. The owners of these vessels will be glad to send them this way with coal at 20s and even less, in order that they may return next fall to England with wheat from this port.

Lead.

Elsewhere the output of the coast for 1888 is given. The more satisfactory prices ruling at the East, owing to the running of a corner, had a stimulating effect on the production, but withlits collapse in November and values sinking to a lower level, there does not exist so much of a desire to increase the output. The consumption in this city aggregates about 600 tons a month, of which the Selby Smelting and Refining Co. takes from 250 to 275 tons and the Pioneer Lead Company about the same, or perhaps a little more. This year it is not at all unlikely but the consumption will be larger, owing to the increasing consumption of lead paint, shot, lead pipes, etc. If it was not for the Standard Oil Co., so as to divide the trade of the Pioneer Lead Co. on this coast, introducing a brand of lead paint made at the East, the consumption of lead on this coast would be much larger, for the consumption of paint has made rapid strides. This competition was brought about by a coal-oil "war" between Whittier, Fuller & Co., proprietors of the Pioneer Lead-Paint Works, and the Standard Oil Company.

MARKET REPORTS

Local Market.

SAN FRANCISCO, Jan. 31, 1889.

Although general trade continues dull yet large wholesale houses look for a very active spring business. The impression they are [illegible] importing extensively in their special lines. Prices are not likely to be lower but the [illegible] due to the [illegible] the [illegible] market. The backs in this city continue [illegible] liberal paper at the rate of [illegible] per cent. The weekly returns of the clearing-house [illegible] receipts of the last week in 1888 were [illegible] the corresponding week in 1887. Among [illegible] general business interests, Among New York [illegible] very high, are cutting [illegible] against what it [illegible] the [illegible] of [illegible] for the [illegible] during the [illegible] made [illegible] advance on the New [illegible] The basis to [illegible] the money market to-day, with only a moderate demand running [illegible] been more doing in wheat [illegible] and [illegible] feel assured funds to keep the [illegible] spring. [illegible] mining stocks [illegible] [illegible] light owing to the majority of the general [illegible] either having sold out or else buying [illegible] this leaves the most of the [illegible] to have [illegible] counts at the banks. The [illegible] has [illegible] listed on the two exchanges, particularly the [illegible] stock issues, is of a very important character, and presages more active times than early days of the stock market. In nearly all of the [illegible] where deadwork has been the order, the work will be more of a prospecting and developing character, but of necessity this takes time. In Virginia [illegible] Belcher, Sag. Belcher, Crown Point, Ophir, Mexican, Union, Sierra Nevada and Utah the ore is said to be of the most important character [illegible] bullion-producing mines—[illegible] Virginia, the [illegible] dle mines," challenge [illegible] prudence—the work continues favorable. In Savage, the recent development on the [illegible] foot level running west, is said [illegible] very important, but it will take time to get [illegible] ged working condition. The coming week is [illegible] claimed, a thorough test will be made of the [illegible] namos for running the Nevada mill, and if they prove as successful as it is supposed, the Nevada mill will drop to stamps, while the Caledonia mill will drop its full complement of stamps, owing to its having a supply of water. It is now asserted that the electric amalgamation experiments at the Douglass mill have proven a success. If this is true this process will be generally adopted on the Comstock, and as it saves more bullion and quicksilver it will have a very decided bearing on the profits of the mines, and make ore grading less than now worked at a loss or barely even to yield a profit.

Official advices from Palisade Silver mine, Stafford, Nevada, encourage the belief that that district will be a large producer of silver bullion before the close of the present year.

The dividends disbursed in this city in January aggregated this year $1,080,000, against $1,075,000 in January, 1888. Of this the mining companies paid out $250,250 last month, against $205,500 for the like month last year.

Messrs. Hayward & Hobart have sold a controlling interest in the Nevada mill, Virginia City, to U. S. Senator Jones and S. H. Jones. The change in the control will not cause a change in the ore milled, unless it be that the mill will crush Savage ore as well as Chollar and Potosi.

SILVER—The market has held throughout the week to strong prices at fully ½ to ⅝c per ounce over the New York quotations. The strength of the market here is due to the light available supply of silver bullion and the high rate of exchange on New York. The latest sale of silver reported in our market was made at 93 5-16c, but at the close it is claimed that a slight advance on the above sale can be had. A fair range of quotations would be 93¾ to 93¾c. From all present advices, it is not at all likely that there will be much of an increase in the silver output of the coast until well into spring.

QUICKSILVER—The market is dull but steady at former quotations.

LEAD—The market is without essential change. The demand is said to show signs of improving.

COPPER—The New York market the past week broke some under a report that the "Syndicate" would not take supplies at previous prices, but under advices that the report was without foundation, values recovered. It is said that there is a large February short interest out.

TIN—The demand is improving, causing a firmer market to obtain, but with no advance in quotations.

The San Jacinto tin mines in San Bernardino county have been sold to an English syndicate. The new owners, with an authorized capital of $1,500,000 will proceed immediately to the development of the property.

COKE—Imports foot up 750 tons, but being sold to arrive, it had no effect on spot prices, which are still quoted strong at $20.

COAL—Quite a reduction in prices for all kinds of coals has been made. The heavy output of Washington Territory, together with the yards being full, have their natural effect on the market. It is very generally claimed that still lower prices will obtain before the summer months pass by.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Jan. 31, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42⅞	92¾	$17 00	$3 81½	$21 60
Friday	42⅞	92¾	16 90	3 80	22 00
Saturday	42 9-16	93	16 90	3 80	21 65
Monday	42 9-16	93	16 90	3 80	21 55
Tuesday	42⅝	93	16 50	3 80	21 45
Wednesday	42⅝	93¼	17 00	3 80	21 55

Borax is weak and under a light demand, but may recover for soap use, as tallow has decreased in cost. Quicksilver is lower and quiet at $60@61. There is a moderate movement in Lake copper—February delivery, $16.50; March, $17.25@17. May is about as high. Pig lead is light. Sales, January, $3.80;

March, $3.85@3.87½. Refined petroleum, per barrel, $7.10; plain cases, $9.10.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. THERE is much indignation among miners north of Redding on account of locating agricultural claims on land known to be mineral.—*Shasta Courier.*

THE Alaska mine, at Pike City, has by process of law fallen into the hands of some of the miners to whom the company was indebted for labor performed.

Legislative.

Senator Pinder's bill to provide against danger to persons from machinery, elevators, etc., was beaten. The objections to the bill are contained in Senator White's explanation of his vote. He said: "I vote against the bill because it seeks to confer upon whoever may be Labor Commissioner the power, without hearing or legal trial, to condemn and thereby destroy the use of property, and makes it criminal to decline obedience to the order of such Commissioner, who is not required to have any technical or other knowledge of the subject upon which he is called to give final judgment." Campbell moved to strike out the enacting clause, as such a bill would close up every shop in the State and was meant merely to satisfy the whims of a few individuals who did not know what they wanted. Concluding, he said: "It gives the Labor Commissioner almost absolute control, yet he is not a mechanic. Such bills do more than anything else to bring on war between labor and capital, and the laborer always suffers. I believe the bill should be killed and killed now, because it is a bad bill and now is the time to kill it."

General Salomon has introduced a bill which, if passed, will cause a sensation in all branches of trade in San Francisco by making it a misdemeanor to sell short weight, and providing ample means of detecting and punishing the present frauds.

The Senate has passed a bill of considerable importance to employers of labor. It provides that the Labor Commissioner shall have free access to all places and works of labor, and any principal, owner, operator, manager or lessee of any mine, factory, works, shop, warehouse, manufacturing or mercantile establishment, or any agent or employe of such principal, owner, operator, manager or lessee, who shall refuse the Commissioner or his duly authorized representative admission therein, or who shall, when requested by him, wilfully neglect or refuse to furnish him any statistics or information pertaining to his lawful duties, which may be in the possession or under the control of said principal, owner, operator, lessee, manager or agent thereof, shall be punished by a fine of not less than $50, nor more than $200.

By unanimous decision of the Assembly Committee on Mining and Mining Interests, it was resolved not to report favorably on the "Burwell Debris Commission Bill," the latter having in contemplation joint action with the "Federal Debris Commission." It was deemed prudent by the representatives from the mountain counties not to drag this question before the Legislature, but to leave it to the U. S. Commission already at work.

1886	103,011,761	44,635,655	43.3-10
1887	104,645,959	41,395,353	39.7-10

The metals, lead, silver and gold are obtained in small quantities in almost all the productive mines located in this inter-mountain region. The ores are mostly low grade, and the assimilation of the metals causes the process of smelting to be the favorite and most economical method of reduction. This fact will explain the increase in the percentage of gold and silver produced in the manufacture of base bullion. It demonstrates conclusively, that any legislation, having for its object the repeal of the present tariff on lead, or the placing of the product of lead or lead ores on the free list, must diminish its production, and decrease in the same ratio the gold and silver product of the United States. This injury to our great mining industry is augmented by the action of the Treasury Department in admitting foreign ores (notably from Mexico) free of duty under a strained and doubtful interpretation of the present laws.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JAN. 22, 1889.

396,440.—BEVERAGE—W. B. Starbird, Stockton, Cal.

396,441.—CULTIVATOR — H. H. Taylor, Santa Rosa, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAMERA-CARRYING CASE AND PLATE-CHANGING BOX.—James H. Johnson, S. F. No. 396,573. Dated Jan. 22, 1889. This invention relates to the cases or boxes for carrying the camera and accessories and providing for their proper manipulation. It consists of an exterior frame having a hinged lid, and in an interior frame telescoping in the exterior frame, and provided with hand-holes with wrist-boards, the two frames forming, when closed, a complete case for carrying the camera, and, when extended, a box in which the plates may be readily changed. The object of the invention is to provide a simple and convenient structure which may serve the combined purpose of a case for carrying the camera and a box in which the plates may be readily and safely changed.

BALE-TIE TWISTER.—Chris. Franco, Livermore, Cal. No. 396,651. Dated Jan. 22, 1889. The object of this device is to cut the wire of which the bale-ties are constructed to the proper length to form the loops upon opposite ends of the wires and to shape these loops so that they may be locked together after the wire has been placed around the bale. With this machine the wire may be taken from the reel or bale and all cut into equal lengths with the equally sized and properly shaped loops formed upon the ends, so that, the size of the bales being determined, the wires for these bales will all be of the same length and have correspondingly sized and shaped loops upon their ends. The manner of securing these wires is to simply pass the hook-shaped loop through the oval one while the bale is being compressed, and then, the hooks turning transversely to the oval loop, as soon as the bale is released the elasticity of the material draws the wire tight around it and makes a secure fastening. By this contrivance any farmer can manufacture his own bale-ties with great rapidity and little expense at the time and place where used and in the quantity required.

OIL-BURNING LIMEKILN.—Albert V. Clark and E. T. Mapel, Alameda. No. 396,541. Dated Jan. 22, 1889. The invention relates to the class of furnaces which are especially adapted for burning oil, and especially to those furnaces for making sewer pipe, pottery, fire-bricks, etc., in which a circular shell incloses the kiln, and is provided with a number of fire-places. The invention consists in the novel arrangement of the fire chambers, oil burners and supply pipes, steam pipe and superheating chamber. The object of the invention is to provide for burning oil in a furnace of this character and a means for employing a low fire at the beginning of the operation, the heat from said fire being utilized to heat the steam which is furnished to the burner, and after the necessity for a low fire has passed, to provide for employing a fire chamber and burner for the subsequent high fire. This arrangement provides for the burners of both fire chambers the necessary dry or superheated steam for their operation, and at the same time by the arrangement of the fireplaces provision is made for the low and high fire at different periods of the operation.

DRIER.—Andrew J. Hatch, S. F. No. 396,562. Dated Jan. 22, 1889. The invention relates to that class of driers for fruit, etc., in which means are provided for producing a horizontal draft through the drying chamber, and in which the fruit is contained on trays carried by cars traveling on tracks into and out of the side or front of the chamber. The patent covers certain details of construction and combinations of devices for perfecting the drier.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

CHAS. F. BLACKBURN—Idaho.

IS IT WORTH THE RISK?—Some engineers have an inclination to use kerosene for removing scale from boilers. It is well for those so inclined to be admonished that its vapor is highly explosive and that recently an engineer, Mr. Jno. Thornton, a prominent member of the N. A. S. E., was badly burned by it. He was examining his boiler, and, as usual, with a lamp in his hand. Aside from this risk, which is not a small one, it is very doubtful if it will accomplish its object. Several who have tried it have concluded they want no more of it. Some who have been advised to try it have, upon making figures on cost, found that "Winans' Anti-Incrustation Powder" is cheaper and perfectly effective.

A VALUABLE PATENT FOR SALE.

Grain-Saving Attachment

This Patent was issued to R. M. Cochran, Dec 22, 1885, and has proven its worth to the farmers of this coast. It can be attached to the combined harvesters now in use, as well as to stationary separators.

Recommendations as to the efficacy of the Grain-Saving Attachment can be furnished from the leading grain-growers of the coast. The purchaser will be given the entire right for the United States, without reserve. Detailed information can be obtained at this office, or of

17 and 19 MAIN ST., SAN FRANCISCO.

EXTENSIVE GOLD MINE FOR SALE.

To be sold at public auction by the undersigned, at the Merchants' Exchange, in the City of Halifax, on Thursday the Fourteenth day of March next, at twelve o'clock noon, that extensive valuable and well-equipped Gold Mine known as the Dufferin Gold Mine, situate on the Atlantic coast, about ninety miles east of said city. Daily mail from Halifax. Telegraph office at Salmon river, four miles from the works. Salmon river harbor never freezes, and is safe and easy of access. The mine embraces 342 areas, each 150x250 feet, all in one block. The entire area measures fifteen hundred feet in width across, and eight thousand five hundred and fifty feet along the lodes. The leases have nearly fourteen years to run, and can at any time be renewed for a period of twenty-one years, upon payment of two dollars per area. Within this area is a belt of veins dipping on each side of an anticlinal. They have been found by tests made on the surface to extend upwards of 4,000 feet. The ore has been partially removed to a depth of 200 feet over a distance of about 700 feet, and to a depth averaging about 70 feet over an additional 1,000 feet in length or thereabouts. The veins are of various width, the largest averaging about ten feet of solid quartz.

This mine was discovered in the Autumn of 1880, but was not worked to any extent until the Autumn of 1881. It has yielded up to the end of November, 31,012 ounces of gold from 64,408 tons of quartz, according to the sworn returns made to the Mines Office. The gold can be produced at a cost which will leave a very handsome margin of profit.

The mine is operated by machinery worked by water power, the power being transmitted by a line of wire rope running from the water wheel to the mine a distance of about 4,750 feet—and lying parallel to the outcrop of said veins, at a distance therefrom of about fifty feet. The Salmon river crosses the property twice. It supplies the hoisting and pumping power, and the same water is afterwards used to drive the crusher. The latter has thirty-eight stamps, and there is ample water power to operate three times that number. Sixty stamps can be operated with present machinery. Of the 120 horse power existing for pumping and hoisting only about twenty-five is used. There are also 700 acres of well timbered and well watered land owned with the mine. This partly covers the areas, and where it does not immediately adjoins them. It is also provided with a steam plant to operate hoisting gear and pumps in case of accident to the transmission power, a sawmill, sufficient for the requirements of the property, a tramway from the mine to the crusher for carrying quartz, and stables, offices, and boarding-houses, sufficient to accommodate a large number of employees.

The mine is owned and has been operated by a partnership, and owing to the death of one of the principal owners it has to be sold to enable his estate to be settled. A good title will be given.

Terms, ten per cent cash, balance within thirty days from day of sale. The deposit to be forfeited in case the purchaser fails to complete the purchase within that time. Further particulars can be had on reference to N. H. MEYNERS, Q. C., Bedford Row, Halifax, or to JAMES DUNCAN & SONS, Auctioneers, Bedford Row.

ENLARGED!

THE VICTOR CONCENTRATOR,

Having passed the experimental stage, is now offered to the consideration of the mining public, in full confidence that it will meet satisfactorily all reasonable requirements. In operation it is unlike any other machine of its class. The concave disc having a rotary reciprocal motion, causing the waste sands to flow over its periphery continuously, while the sulphurets are also drawn continuously through its center, the whole process being automatic and complete. The Batea in the hands of an expert is known to be the nearest to perfection for concentration. This is the principle upon which this machine works. The advantages gained are:

1. Greater capacity with more perfect work.
2. Simplicity of construction and management.
3. When used as an amalgamator it has no equal.
4. The first cost is less than other machines of much less capacity.
5. The shipping weight is less than 1000 pounds.

Mine owners and millmen are invited to carefully examine the Victor before deciding upon their concentrating works. Address

S. W. SHAW, or N. W. SPAULDING,
17 and 19 Fremont Street, SAN FRANCISCO.

GUTENBERGER'S ROLLER ORE CRUSHER.

Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gearings, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low grade ore on account of low cost of working. The first ore crusher used in Durango, Mexico, was built at my shop in Sacramento, and under my patent.

☞ Any Infringement on this Patent will be prosecuted to the full extent of the law.

WM. GUTENBERGER, Sacramento Foundry, corner N and Front Sts., Sacramento.

ESTABLISHED 1866.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Pamlico, Jan. 26, $36,000; Savage, 26, $18,104; Cons. California and Virginia, 26, $55,958; total to date, $112,253; Navajo, 28, $14,100; Lexington, 25, $22,928; Hanauer, 23, $3850; 24, $1875; 25, $3600; 26, $1800; Hale and Norcross, 30, $4444; Mt. Diablo, 30, $8346; total on January account, $28,360.

THE Victoria *Colonist* says: The steamship Idaho arrived at Nanaimo on Saturday and brought news of the discovery of an immensely rich silver mine at Ship Creek, seven miles from Juneau, Alaska.

Mining Share Market.

Low prices and light sales continue to be the rule in the mining stock market. As soon as a stock shows a slight advance it seems to get set back again with remarkable promptitude. In speaking of Comstock shares, the Virginia *Enterprise* says: They have tallen into a rut from which nothing appears to have power to lift them. Neither new developments nor bullion shipments are potent to produce even the slightest upward movement. They are all down in the mud at the bottom of the wheel, and the wheel is frozen fast. In these times the wisdom of the men of "pointers" is as the idiot—mere vain imaginings and wind. As no one knows why prices remain down, so they will presently be seen to go up without any apparent cause.

The reports received at the Bay that all the mills on the Carson river were frozen up and the mines had ceased shipping ore, also doubtless caused some intending purchasers to pause and hold back their coin in the hope of a more propitious season for taking in their favorites.

The news from the lower levels of the leading mines continues favorable, the majority having in sight considerable bodies of ore of good milling grade.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

GLOBE DRY ORE CONCENTRATOR CO., Jan. 24. Capital stock, $500,000, in 100,000 shares. Directors—C. F. Jacobson, S. Denis de Porte, A. T. von Ettinger, H. K. Stolberg, L. P. Martin, D. H. Fogus and W. F. Gibson.

FRUTO & ROUND VALLEY WAGON-ROAD CO., Jan. 24. The road is to be constructed from Bridgeport, Stony Creek valley, Colusa county, thence by the most accessible route around the south fork of Grindstone and Cold creeks, a distance of 24 miles. Capital stock, $24,000, in 2400 shares. Directors—D. W. Grover, W. C. Murdock, H. M. Hanmore, J. C. Storey, Frank Maskey, Charles Garthorn, F. T. Scott, Edward Foster and L. B. McCormick.

CALIFORNIA ARCHITECTURAL PUBLISHING CO., Jan. 26. Directors—W. J. Cuthbertson, Oliver Everett, Albert Pissis, W. P. Moore, H. T. Bestor, R. H. White and W. J. Mathews.

SHERMAN M. CO., Jan. 26. Location, El Dorado county. Capital stock, $1,000,000. Directors—J. T. Cochran, E. B. Dean, D. J. Moulton, Nathan Rosenberg, and F. R. Cotton.

SHENANDOAH M. CO., Jan. 25. Location, Plumas county. Capital stock, $1,000,000. Directors—F. B. Whiting of Quincy, Plumas county; W. W. Camron, J. S. White, W. R. Thomas, and A. F. Merriman of Oakland.

SAN FRANCISCO POLYCLINIC SOCIETY, Jan. 29. The corporation is formed, and pursuant to an Act of the Legislature, entitled "An Act providing for the incorporation of colleges and seminaries of learning, approved March 14, 1885." The object is to give gratuitous treatment to the deserving poor and to carry on and maintain a hospital, with all its necessities, and to give post-graduate instruction to graduates of regular colleges of medicine. Directors—Drs. H. Kreutzmann, Von Hoffmann, H. L. Wagner, R. J. Bowie and M. Regensburger.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic & Pacific Railroad. They contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

DELINQUENT NOTICE.

Lord of Lorn Gold and Silver Mining Company. Location of principal place of business, San Francisco, California. Location of works, Gold Hill Mining District, Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of Assessment (No. 4) levied on the 19th day of December, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

— ALSO —

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR

LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO., SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

Risdon Iron Works, San Francisco GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to sliming, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequaled by any mill now in existence.

Yours truly, D. M. BURNS, Superintendent

We are also prepared to **CONSTRUCT** and **DELIVER** in **COMPLETE RUNNING ORDER,** in any locality, **MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC.,** of any **DESIRED CAPACITY.**

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

SAN FRANCISCO, SATURDAY, FEBRUARY 9, 1889.

VOLUME LVIII. Number 6.

Pneumatic Locomotive for Mines.

Compressed air offers a valuable source of motive power in mines where the conditions of ventilation, or other causes, preclude the introduction of steam locomotives. Unlike steam, its operation introduces fresh, pure air into the passageways of mines, instead of deleterious gases which must be prevented from reaching the lungs of the workmen. In the construction of long railway tunnels, the removal of large quantities of material, without injuriously affecting the ventilation, becomes an important question. The experience of the engineers of the St. Gothard railway showed most conclusively the value of pneumatic locomotives for such work. The locomotives, as represented in the accompanying illustration, are especially well adapted to similar service.

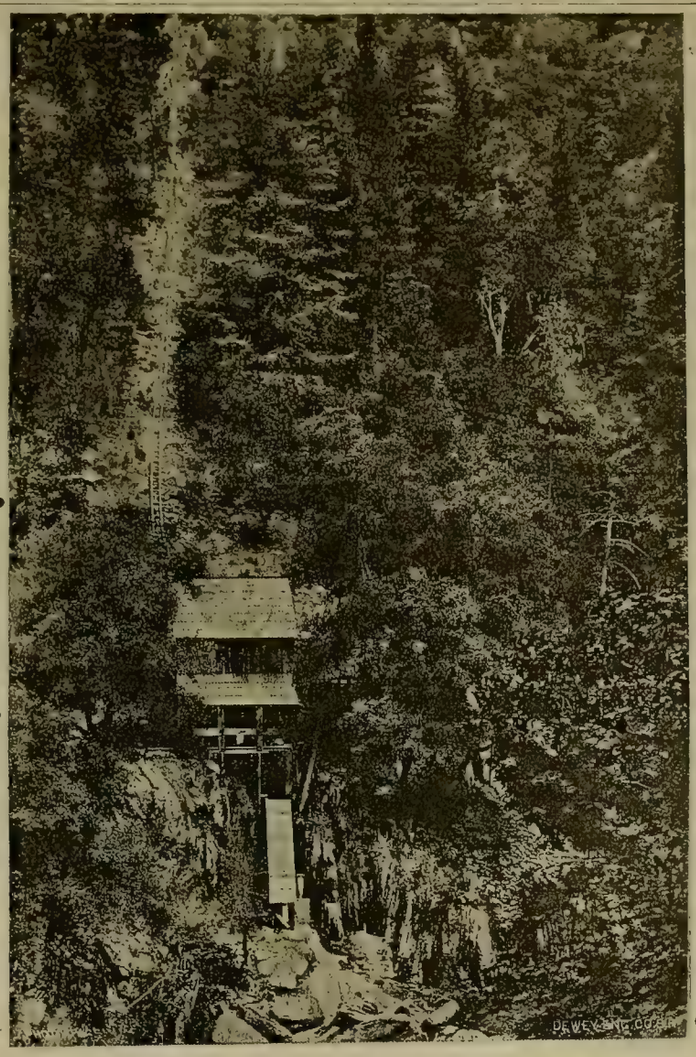
The following may be enumerated as among the advantages peculiar to pneumatic locomotives:

In their use no deterioration can result from the burning out of fire-box or flues, nor from the injurious effects of alternate heating and cooling of the boiler and fire-box. Nor can the reservoirs become weakened from the formation of incrustations, nor from corrosion, if properly cared for. Such immunity from deterioration conduces greatly to economy of maintenance and repairs.

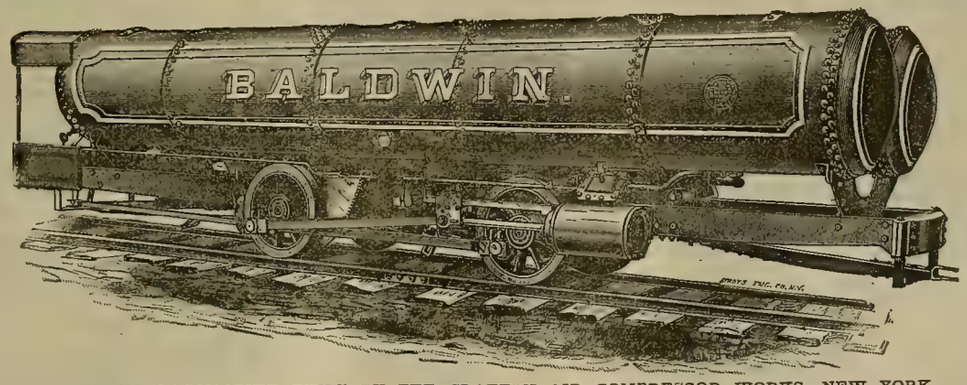
There can be no liability to explosion from any sudden increase of pressure, from exposure of crown sheets, nor from the failure of safety valves to act. The initial pressure, which is obtained from the storage reservoir, and which can be readily gauged, is the greatest which can at any time come upon the main reservoir. In many mines where the temperature is constantly at from 80° to 90° Fahrenheit, the introduction of the cold air which escapes from the exhaust ports of pneumatic locomotives is most salubrious. The substitution of compressed air for steam, for running the hoisting-engines in the mines of the Plymouth Coal Co., Luzerne county, Penn., resulted in a reduction of the temperature in the section of the mine where engines were at work, one-third, viz., from 90° to 60° Fahrenheit.

No injury to the health of workmen can result from the operation of pneumatic locomotives in passages difficult of ventilation or in the intake airways of mines. Renewal of the atmosphere, rather than vitiation, results from their presence. Their presence entails no liability to explosions from the ignition of dangerous gases, such as have caused the loss of thousands of lives and the destruction of millions of dollars' worth of property. These are considerations which cannot fail to recommend pneumatic-power as a means of locomotion to the managers of mines.

The Clayton Air-Compressor Works, 43 Dey street, New York, from whose catalogue the above cut is taken, and whose air compressors for mining and tunneling purposes are so favorably known on this coast, build a special design of air compressors for supplying compressed air to pneumatic locomotives at a pressure of 400 to 600 pounds per square inch, experience having shown that the latter is as high a pressure as can be conveniently used. The compressors are built either duplex or single, with or without compound compression cylinders.



TRAMWAY AND MILL AT THE DORER MINE.



PNEUMATIC LOCOMOTIVE BUILT BY THE CLAYTON AIR COMPRESSOR WORKS, NEW YORK.

Proxies in Mining-Company Elections.

Senator Dargie of Alameda county has introduced into the State Senate a bill designed to prevent a few brokers from controlling a mine, unless they own the controlling number of shares. One needs to look back only a few months in San Francisco to get evidence of how the system of proxies has worked injuriously with reference to the election of certain mining corporations. The bill above referred to, and which, if it becomes a law, will be introduced into the Corporation law of the State, reads as follows: Section 3. It shall be unlawful for any such corporation, or the secretary thereof, to close the books of said corporation more than two days prior to the day of election. At such election the stock of said corporation shall be voted by the bona-fide owners thereof, as shown by the books of said corporation, unless the certificate of stock, duly indorsed, be produced at such election, or by proxies or representatives. All proxies must be in writing, and must be executed by the bona-fide owner of the stock, and must be accompanied with the affidavit of such owner. Brokers or persons holding such stock as security, are not bona fide owners in the sense in which the words are used in this section.

A Mine Tramway.

In last week's PRESS we gave two photo-facsimiles of views photographed at the Dorer mine, on the South Fork of the North Fork of the American river. The mill is run by water-power, and is on the river-bank. The mine is on the divide, above the river, and the ore is brought down to the mill by a tramway 3100 feet long. This tramway has three tracks halfway and an automatic switch. A view of this tramway is shown in the accompanying cut, which was made from a photograph by Geo. W. Bornin

LAKE COUNTY MINES.—Gold has been found recently at Middle Mountain, about six miles from Upper Lake, in Lake county. A. N. Poe, Jr., has located both placer and quartz claims. Specimens procured have been pronounced good "prospects" by old miners. The placers are on the mountain and it will be hard to get water to them. The quartz claims are to be developed immediately, for, though it has been known that there was some gold in the vicinity, until now no systematic work has been done. Several claims have been located. The success of the Los Burros mines, Monterey county, has upset the theory of there being no gold mines in the Coast Range, and other localities are now being prospected and tested.

COAL.—Receipts of coal at this port in January were 95,177 tons, against 100,757 tons in January, 1888. Of last month's receipts, 71,700 tons were from collieries. The coal market continues weak. Stocks of both house and steam coal are now ample.

California Forestry.

The California State Board of Forestry has made another notable contribution to the popularization of tree lore and to the cause of preserving and extending our forest area in their Second Biennial Report, which has just been issued from the office of the State Printer.

It is a volume of 182 pages and contains much matter of interest regarding the work of the Board and also advice of value about tree-culture. The present Commissioners are Abbot Kinney of San Gabriel, John D. Spreckels of this city, and Walker S. Moore of Los Angeles. The secretary is Sands W. Forman.

In our reports of the meetings of the Board during the past two years, we have kept our readers generally informed on the establishment of Forestry Stations, the propagation and distributing of seedlings, etc. Concerning the purposes of the Board with reference to these stations, the report says:

These stations are at Santa Monica, Chico, Merced, Hesperia and San Jacinto, and land has been offered for two others. The plan is to plant these stations in park form, while also having all the trees properly labeled and catalogued, so that the people will be charmed by the beauties of these parks, and at the same time instructed by the information they will give as to the capacities of different trees in our different soils and climates. Golden Gate park is of inestimable value to all citizens. The experimental parks of this board, if properly supported and carried out, will have the same and an additional value to the residents of the State where they are situated. Besides this, they will add greatly to the attractiveness of the State itself. Few places in France are more generally visited than the botanical gardens at Paris; in England than the gardens at Kew; in Germany than the Thier Garten, near Berlin, etc.

In these parks scientific tree-culture is the main feature. Our experimental stations in California, owing to our climate, can be made both more useful and more attractive than any of them. It seems certainly advisable to show by such State institutions what the different parts of the State are capable of in tree-culture. These stations will do this by actual visible experiment to show what will succeed, and by reliable record to show what will not succeed, and thus save time and expense to the citizens, all the time attracting the settler by the beauties demonstrated in the park itself as a capacity of California.

Other portions of the volume contain reports from the engineer of the Board, H. S. Davidson, who submits detailed forestry maps of several of the northern counties of the State, and reports concerning the illegal cutting of forests on Government land, which the Board is endeavoring to stop. There is also a report by W. S. Lyon, head forester, concerning the adaptation of certain trees to California conditions, which we shall present to our readers at another time.

Our attention is naturally arrested in this first glance at the Report of the Commission by the work of Prof. and Mrs. J. G. Lemmon, the botanist and artist of the Board. They visited nearly every county of the State and Lower California in their investigations of the pines of the Pacific Slope. After introductory statements treating of ocean currents, atmospheric conditions and land configuration—the several factors of forest production—a brief general view is taken of the Pacific forests, and especially those of the Sierra Nevada. Then follows a conspectus of the order of cone-bearers and tables showing distribution, etc., after which the main body of the work is reached—the pines of the Pacific Slope, giving first a descriptive list of the groups and species. The cone-bearers of the Pacific Slope, classed in three sub-orders or tribes, compriss 14 genera and 52 species.

Prof. Lemmon is entitled to special credit from lay readers in that he makes the attempt, which seems to us notably successful, to so classify, name, and simplify descriptions as to popularize the study of our interesting pines by the ordinary reader, who is often deterred from study by the many technical particulars used in most works of instruction or discussion.

Following the "descriptive list" are extended descriptions of each of the California species, including in most instances a history of their discovery. A special investigation of two of our most valuable lumber trees—*Pinus ponderosa* and *P. Jeffreyi*—follow, after which are placed "Pines in Literature;" and various topics of interest, including the discussion of the microscopic and other abstruse characters which, however, are necessary to a correct and full study of the pines, and are presented in a paper by themselves, "The Diagnosis of the Genus Pinus," placed at the end of the report.

Artotype illustrations, 24 in number, from photographs taken in the forests of characteristic trees, and from prepared specimens of cones, flowers, leaves, seeds, microscopic cross-sections of leaves, etc., have been carefully prepared. The larger and more elaborate water-color paintings by Mrs. Lemmon, treating closely of details, life size, of our California pines, could not be chromo-lithographed for this report, owing to the much greater expense of such works; but they will be perfected in certain details and augmented by other paintings, completing the series of California pines, when, it is hoped, a future report may be accompanied by these finished and most instructive illustrations.

But we cannot follow this valuable report further at this time. Though the name of the chairman of the commission, Abbot Kinney of Los Angeles county, only appears incidentally in the work, those who know his zeal and thoroughness in pursuit of ends he believes in well know that a leading share of the credit for the work done is due to him, and will award honor to whom honor is due.

Portable Buildings.

Under the auspices of the Red Cross Society an exhibition was held at Antwerp in Sept., 1885, of buildings especially adapted for isolated and field hospitals; and from the number exhibited (upward of 70) the one invented and patented by Mr. Wm. M. Ducker of Brooklyn, New York, U. S. A., came the nearest to filling all the specifications of the society. It received a special medal, offered by Her Majesty, the Empress of Germany, and the warmest encomiums from civil and military surgeons, engineers, architects and philanthropists from all parts of the civilized world.

A commission appointed by the Minister of War for France, to examine this and other portable buildings, has decided in favor of the "Ducker portable building." The German War Department made no awards for plans received, but bought a building exhibited by the Ducker Company. Wherever it has been exhibited in the United States it has been adopted, and is now in use in the United States Naval and Marine hospital service.

The English Government has adopted the system, and are now using these buildings at the Wellington barracks in London.

These buildings combine most of the comforts and advantages of a permanent structure, with the qualities of simplicity, stability, lightness, ease of transportation, quickness of putting up and taking down, ventilation, heating, facility of cleansing and disinfecting.

They are serviceable for contractors (who can sell them readily when their work is completed) and for large estates, especially cattle and sheep ranches, for surveyors and prospectors and mining camps, where building material and skilled labor are scarce, and where it is desirable to change location.

These buildings can be especially constructed for hunting and fishing camps, billiard-rooms, boathouses, photographers' studios, lawn pavilions, for dwellings at the seaside, and other summer resorts; and for innumerable services demanded in small houses, they are most convenient.

The price of these buildings, all complete, in New York, delivered f. o. b., will range from $250 to $750, according to size and finish. The Ducker Portable House Co., Nassau and Liberty streets, N. Y., will mail illustrated circular and price list on application.

TINMEN.—At the hotels last evening a large number of gentlemen from the tin districts were seen and interviewed concerning their presence in the city. The only information obtained, however, was to the effect that the annual assessment work had been completed and that their presence in the city combined business and pleasure. One miner said he was looking for the arrival from London of several English capitalists with whom he expected to consummate a big tin deal. The miners are cheerful over the prospects of their locations, sure that work in earnest will be commenced in the production of the most valuable metal tin in the near future. The immense value of the tin mines is no longer a mooted question, and just why capital cannot be found to take hold with a view to producing tin for the market seems surprisingly strange to those who feel and believe "there's millions in it."—*Dakota Republican.*

A BIG MINE.—The Sydney *News* prints the following interesting figures in regard to the Mount Morgan mine: The balance-sheet for the six months ended November 30th shows a balance from the previous half year of £42,691, which with £274,607 received for the sale of gold, and £60 and sundry accounts, make the receipts £317,359 during the half year. The dividends paid amounted to £225,000, leaving a balance to carry forward of £15,495. The expenditure included £24,822 wages, £4600 buildings, £2200 plant and material, £12 748 new plant, £1400 sulphuric acid works, £823 directors' expenses, and £871 electric lighting plant.

TELESCOPES.—Of the world's refraction telescopes, nine have apertures exceeding 20 inches, viz.: Lick Observatory, California, 36 inches; Pulka, Russia, 30; Yale College, 28; Littrow, Vienna, 27; University of Virginia, 26; Washington Naval Observatory, 26; Gateshead, England, 25; Princeton, New Jersey, 23; and Buckingham Palace, London, England, 21. Six of these instruments are the work of an American firm.

PARTIES lately in from the Kenri peninsula, in Alaska, report that there are large areas of huckleberries, sometimes hundreds of acres, also cranberries, and red and black currants, and there are thousands of acres of red-top grass.

Where the Bullion Goes.

E. T. Hale writes to the Virginia *Enterprise* as follows: "I desire to submit a few facts, not opinions, as to where the coin goes to; also where the bullion goes to.

It takes seven hundred and seventy-three and a half (773½) ounces of pure silver bullion to coin one thousand dollars ($1000) of 412½ grains each 900 fine (10 per cent added in alloys), or 723½ ounces to coin $1000 in fractions of one dollar of the same fineness. Now, 773½ ounces of silver at 93 cents per ounce, the price this day, would be equal to $719.35, the amount the producer receives for $1000 worth of silver bullion, and the Government gets $280.65 for placing its stamp on 1000 one-dollar pieces; but as the largest coinage is in fractional currency we will have to see the profit to the Government on fractional currency. It takes 723½ ounces (nearly) to coin $1000 in fractional currency. This, at 93 cents per ounce, would equal $672.85, the purchase price of silver bullion enough to coin $1000 in fractional currency, and here the Government makes a profit of $327.15 off an investment of $672 85. Now, as the Government makes a profit of $280.65 on every $1000, coined at a coinage of $2,000,000 per month, the minimum allowed by law, the monthly profits to the Government would be $561,300, equal to an annual income of $6,735,600 with bullion at 93 cents per ounce, a handsome sum to add to the surplus now too large.

But this is not all. Wells, Fargo & Co.'s annual statement of the bullion yield of 1888 shows there was shipped to China from San Francisco in the last 12 months, $14,621,431 at par value, but they pay only the ruling price per ounce, say 93 cents, the ruling rate of today. They would pay only $10,517,927, making a profit off of the silver producer last year of $4,103,504, and this in favor of China. This amount added to the $6,735 600, the profit to the Government per annum, would be equal to $10,839,104, a net loss to the producer out of $36,621,431 coined by the Government and shipped to China, leaving only $14,531,316 in unsold bullion to be used in the arts, etc. This amount at the same price (93 cents) per ounce, would be equal to $10,453,103, making a loss to producers of $4,078,213, and a total loss of $14,917 317 to the producer for the year 1888, out of a total yield of $53,152,747. This amount divided between the following States and Territories in proportion to production would be as follows:

	Silver Production.	Discount.
California	$ 652,652	$ 183 106
Nevada	6,858,520	1,924,844
Idaho	3,700,000	1,038,405
Montana	11,500,000	3,227,475
Utah	3,479.138	976,420
Colorado	17,725,100	4,974,640
New Mexico	183,641	51,539
Arizona	850,798	238,776
Dakota	453 216	127,195
Base bullion and ore by freight	7,740,682	2,174,918

Three States, California, Nevada and Colorado, represent a bullion product of $25,236,272, and are represented in Congress; but the six Territories, Idaho, Montana, Utah, New Mexico, Arizona and Dakota, have a bullion product of $27,916,475, but have no representation in Congress. This fact alone should make the Pacific Coast representatives in Congress more determined than ever before to have all or a part of the Territories admitted to Statehood, and they would then have more assistance in the halls of Congress in behalf of silver-producers. *Free Coinage* would be the just thing for this coast. No other industry in the United States suffers like the silver-bullion producers.

TOO GOOD A LAW.—If a man locates a claim on the first day of January, he is the legal owner of it for the ensuing two years—it is two years lacking a few hours. This gives the speculative drone a fine opportunity to do the dog-in-the-manger act. It is too much latitude to be allowed to that class of "bar-room prospectors" whose only desire is to make locations and hold on to them without work, in the hope of selling out to somebody who has money to invest. In this manner they control ground which honest workers would like to develop The objections to this clause of the mining law are many, but how to surmount them without injustice to well intentioned prospectors is somewhat of a puzzle. But there is one thing that can be obviated. If a man permits a claim to become delinquent by reason of neglecting to perform the annual labor, he should never be allowed to hold it again, either by location or deed. There are many good parcels of mining ground in Esmeralda county that have been held for years by men who never intend to do any work on them, but the good-natured law enables them to maintain their title by the relocation process, exercised by means of agents who locate and "deed back" to them.—*Hawthorne Bulletin.*

THE Northern Pacific grade through Cœur d'Alene is completed to Mul'an, and the men discharged for the season. A new boat will be put on Lake Pend d'Oreille by the Cœur d'Alene Navigation Company to carry passengers between Hope and the new chloride camp. The boat will carry 100 passengers and 25 tons of freight. Miners, prospectors and capitalists are rushing into the camp at the rate of 200 weekly.

Engine Tests for the Charleston.

The Union Iron Works have been notified by Secretary Whitney that the following conditions will have to be observed during the trial of the engines of the cruiser Charleston on a continuous four-hours' run in Santa Barbara channel:

In order that there may be no mistake due to the failure of the engine-counter to properly register, an additional counter will be fitted for use during the trial; and if there be any difference in the readings of the counters, the readings of the one showing the greatest number will be taken. Indicator diagrams will be taken from the cylinders of the main engines every 15 minutes, and a sufficient number of navy engineers will be detailed to do the work—one for each of the main cylinders, others to attend to the air and circular engines.

The reading of both counters will be taken at the beginning of every quarter of an hour, and again after an interval of ten minutes, and the difference of these readings divided by ten will be taken as the revolutions at the time the indicator cards are taken. Cards will be taken during this ten-minute interval, and during this time neither the stop nor the throttle valve is to be touched. During the next five minutes these valves may be adjusted as found necessary. This method of procedure is to take place every 15 minutes.

The sum of the indicated horse-power of each observation, divided by the number of observations, is to be the mean indicated horse-power of the trial. Defective cards are to be thrown out, and the indications of the two cards nearest to the defective one shall be averaged, and inserted as the proper indications for the defective cards. The air pumps are to be indicated once an hour at regular intervals while the main engines are running.

The other auxiliaries will be indicated one at a time after the trial. The speed of these engines, as well as all the data of their working, will be carefully noted during the trial in order to obtain similar, or as near as possible, results at subsequent trials. The speed of each blower is to be taken at half-hour periods, and the steam pressure, exact opening of the throttle-valve and air pressure in the boiler-room noted.

The four-hours' trial must be consecutive time, but the builders will be allowed the option of trials at their own expense until one satisfactory to them is obtained, the Secretary of the Navy reserving the right to limit and determine the number of these trials.

The Forests of Alaska.

The prevailing forest tree of Alaska, says Mr. George Davidson of the Coast Survey, is the Sitka spruce, growing to great size, covering every part of the ground and climbing the steepest mountain-sides to the hight of 2000 or 2500 feet above the sea.

This tree resembles in form and foliage the silver firs of California. In the Archipelago Alexander, with a shore-line of more than 7800 statute miles, the land is densely wooded from the water's edge. It can never be devastated by forest fires, because the carpet of wet sphagnum over the surface of the country effectually prevents fires from spreading.

We measured felled spruce trees that were 180 feet long and four feet thick at the butt, while adjacent standing trees measured over six feet in diameter, were branchless for over 50 feet, and estimated to be 250 feet high.

Hemlock, alders and willows are found, but the most remarkable wood of the country is the yellow cedar, with fine, even texture, fragrant smell, good size and greater strength than the spruce. It is readily worked, takes a smooth surface and is remarkably durable. It is a valuable addition to cabinet woods, and is superior as a ship timber to any on the coast.

It can be obtained of ample size for frames and knees of ordinary-sized vessels. We measured one 18 feet in circumference, and estimated it to be over 125 feet in hight. We collected part of the keelson and frame of a Russian vessel built of this wood 32 years before, and which had been lying a wreck on the beach for several years. It exhibited no signs of decay nor of teredo attacks, and the wood around the copper and iron bolts is nearly as well preserved as on the day they were driven.

On Kadiak island the forests cease toward the south. The yellow cedar does not grow on the northeast part of the island, but the average size of the spruce is less than two feet in diameter.

Hemlock is found in abundance and has its value for tanning purposes.

When the forests of Washington Territory and Oregon are exhausted, Alaska will be the great and our almost inexhaustible resource in the future.

HOLLISTER COAL.—H. L. Schaffer, an experienced miner who has worked in coal mines in Montana and Idaho, has been prospecting for the last two weeks for coal on the ranch of Mr. A. Sally, six miles southwest of Hollister. He reports that he has uncovered a vein of coal 20 feet in width. The coal is of good quality, burns readily, and makes an excellent fire. It is said to be a first-rate quality of stove coal.—*Free Lance.*

A Flourishing Northern City.

[From Our Own Correspondent.]

Astoria is emphatically a "city by the sea." Its only communication with the world abroad is by means of steamers and other water craft, and the occupation of a large proportion of its inhabitants is related to the navigation of waters or the catching and curing of the fish of the sea.

Astoria has a picturesque appearance, especially when approached from the water-side. Its white buildings stand out in relief against the dark background of a timber-fringed bluff, which rises to a considerable hight in the rear of the city. There is little table-land at the foot of this hill, so that the city extends out over the tide lands, and is fronted by a continuous line of wharves from one end to the other. It is but a block or two from the main street of the city to the water front. As the city grows it will creep up the sides of the bluff, where are excellent building sites, but where there will be a necessity for considerable grading to make the streets conform to business requirements. The present population of the city is said to be 6500, and from a comparison with other cities we should say this was not an overestimation.

Astoria is noted for the magnitude of the operations carried on in the canning of salmon. The greatest salmon fisheries of the world are at the mouth of the Columbia river, and a goodly portion of the Astorians is directly or indirectly connected with this industry. The fleet of fishing boats on the river, after the salmon begin to run in the spring, is a sight to be remembered. Although the weather may be rough, the fishermen go out almost to the bar, and at night may return with loaded boats. Many of the fishermen have accumulated considerable property, and their comfortable houses constitute a large part of the city, which stretches along the river for over two miles. At least 3000 fishermen make this city their home during the fishing season, fully one-half of whom abide here permanently. There are 22 canneries in Astoria, some of which are very extensive institutions, where 50 to 60 employes (largely Chinese, however,) are engaged in the canning operations besides the fishermen. Over $2,000,000 are disbursed annually to the fishermen and laborers in the canneries of this city. The pack in 1887 was valued at $3,000,000.

There are three sawmills in Astoria. One of these cuts 70 M. feet of lumber per day, another 40 M. to 45 M. feet and the third 30 M. feet. Each of these mills has a box factory in connection, and besides making boxes for local use at the canneries, large supplies of box material are sent to San Francisco, San Jose and California towns. There are also three or four iron foundries and machine-shops.

Quite extensive shipping interests are centered at Astoria. Twelve to fifteen small steamers make regular or spasmodic trips to such adjacent towns as Ilwaco, Skipinon, Knappa, Knapton, Gray's Harbor and other smaller places. This city seems to be the main supply for these small towns, and the aggregate of trade from this source is considerable.

Foreign vessels for Portland and other Columbia-river points make report of entry at Astoria. There is a good custom-house here, which serves also for postoffice. The light-house steamer Manzanita, which carries supplies to the light-houses of this portion of the coast, and which attends to the buoys hereabout, makes Astoria its headquarters. The revenue cutter Corwin will also remain here while not engaged in actual service in Alaskan waters.

An ocean steamer touches here on the way from San Francisco to Portland every four days; there are two regular daily steamers between Portland and Astoria, and while the Alaskan steamers are running, they make this point an important stopping-place.

INDUSTRIAL ART AND MECHANICAL DRAWING. From a circular issued by Superintendent of Schools Anderson of this city, we take the following: The Board of Education have decided that the present course of drawing in the primary and grammar schools shall be replaced by an industrial art course for girls and boys up to the second grade and by a mechanical drawing course for boys of the first and second grades. Classes for instruction in the method will be opened at the John Swett Grammar School, Broadway Grammar School, Valencia Grammar School and Lincoln Grammar School, beginning on Monday, the 4th of February. Meetings will be held at the Broadway Grammar and the Lincoln Grammar every Monday and Wednesday until further notice, and at the John Swett Grammar and Valencia Grammar every Tuesday and Thursday until further notice. Classes will be called promptly at 3 P. M. The principals of the several schools will be held responsible for the direction of this work in their respective schools, and it shall be their duty to see that the lessons given by the drawing teacher are given to, and mastered by, the teachers of their respective schools. For this purpose the teachers of each school shall assemble from time to time in their own school buildings and receive instruction under the direction of the principal in the work taught by the drawing teacher.

Photo-facsimile.

A PARTIAL VIEW OF THE CITY AND HARBOR OF ASTORIA, OREGON.

AN ELECTRICIANS' SOCIETY.—A meeting of those connected with the telephone, telegraph, electric light and electrical industries in this city was held last week. Prof. N. S. Keith was elected temporary chairman and M. J. Wall temporary secretary. There were 55 names enrolled as members of the society, which is for the mutual improvement of its members in electrical science and art. It is intended to have lectures, papers, discussions and exhibitions provided on subjects relating to electricity. The meeting was an enthusiastic one. The Committee on Permanent Organization appointed was as follows: N. S. Keith, W. W. Wighte, C. T. Rylands, Jr., W. Shute and V. P. Brown. The committee appointed to wait upon gentlemen connected with electrical science consisted of S. H. Taylor, G. I. Kinney and W. Pelt. D. J. McCarthy had prepared a paper on electrical science to read to the society, but the reading was postponed on account of pressure of business.

THE three staple shipments from Port Harford are beans, butter and bituminous rock. The first go to Boston, Mass., the second to San Diego and the last comes to San Francisco.

Utah Asphaltum.

The Salt Lake *Tribune* says: The North American Asphalt Company, backed by St. Louis capital, have spent $40,000 in putting in machinery near Thistle station on the D. & R. G. Western, to work asphaltum extracted from the extensive mines. This machinery was calculated on a capacity of 500 tons, crude, per day, from which they expect to get about 35 per cent asphaltum. The process is both mechanical and chemical, and the works just ready for operating are expected to be running soon. Besides asphaltum, the works are to produce naphtha, petroleum oils for lubricating, and the greatest product is to be the paving materials. This company hopes to make this a great industry, and soon to be able to supply all the West with paving, varnish and other classes of asphalt.

In Emery county, Utah, near the Colorado line, and not far removed from the Denver & Rio Grande Western, are immense beds of asphaltum, lately discovered, and which are to be improved by some men of Grand Junction, Colorado, who have filed on the land. This asphaltum is found in several distinct forms. The main body is mixed with sand in a black mass, so moist as to be something like putty except for the granulations. Another form less common is in a black, flinty form, being the residue from liquid asphaltum with the volatile portions all gone. This is more or less mixed with clay, and will be easily refined. Then there are springs pouring out a black mass like thick molasses. In this form it can be refined at small expense, and will produce a good quality for the many uses to which liquid asphaltum is put. An analysis of these several varieties shows that that mixed with sand will make a good paving material; the liquid will produce varnishes by being distilled, or can be used in its present condition for roofing or paving, and the dry, flinty kind will make good varnishes or lacquer. The country around is certainly an interesting one because of these deposits, and also on account of the coal measures near there. This coal, of which there are thousands of acres, partakes largely of the character of anthracite, but it is not known to be a true anthracite. In the vein there are seams of what looks to be coal, but which, on burning, throws out an odor of petroleum, and when heated is so soft and tough as to be shaved with a knife like a piece of cheese. These deposits will be developed ere long, and it is believed will prove of great value and add much to the industries of Utah.

MINE PURCHASE.—The people of Placerville are greatly elated over the prospects of great prosperity in the immediate future. A New York company of large means has purchased the Deep Gravel Mining & Water Company's ditch and the Pacific Mining property, on which is a good mill and hoisting works, together with the Oregon, the Eply, the Rose and other mines on the same belt, and they will open up these claims at once. This means employment for several hundred men. The value of the property reaches into the millions. Prof. Price of San Francisco is president of the company.

Water Prospects.

Thus far the outlook for water for agricultural and milling purposes next summer is not flattering. There are now only three feet of snow in the Sierra Nevada mountains, where there should be at least 15 or 20 feet. "Never mind," say the ever-hopeful ones, "we will see plenty of snow in February and March." That is probable. We do not much doubt the occurrence of heavy falls between this time and the end of March, but it is not the season in which the big snowfall of the winter is most desirable. Could we have our way, we would wish to see a fall of 10 or 20 feet early in the winter. It would then become solidified—would be about as firm and compact as ice. It would in that condition constitute a valuable reserve of water—would equal an immense storage reservoir in the mountains.

A fall of snow, however great, late in winter does not properly solidify. It is so loose that the first warm southerly winds cut into it almost as rapidly as would a stream of hot water plunged through a hose. A snow in March would not long endure the warm days of April and May. It would be better than rain, but soon it would all be gone. With storage reservoirs to catch the water during the rush we would be all right, but situated as we are we shall be all wrong. Another short milling season is almost certain. In July we shall have the old fight for water between the millmen and the ranchers, and in August and September there will not be much to fight about.

Curiously enough, in Eastern Nevada they will be better off than we here under the eaves of the Sierras. In all the mountain ranges in Eastern Nevada the fall of snow has been unusually heavy. The *Silver State* of day before yesterday says: "The prospects of high water in the Humboldt next spring are not as good as they might be, though the outlook is more promising than it was a year ago. Railroad men say that the ranchers at Wells estimate that there is twice as much snow in the mountains at the head of the Humboldt as there was this time last year. The snowfall is light in the ranges about Paradise valley, though there is said to be considerable snow at the head of the Little Humboldt. As it is getting rather late in the season for heavy snows to fall in the mountains, farmers and stockmen say the salvation of the country depends upon a wet spring."—*Virginia (Nev.) Enterprise.*

JAPANESE COAL.—The collieries in Japan yearly produce about 1,500,000 tons of coal. The following is the estimated coal wealth of the various districts: 150,000 tons from the Miike mine (Chikugo district); 330,000 tons, Karatsu and Taku (Hizen district); 70,000 tons, Hirago and Imobuku (Hizen district); 670,000 tons, Chikuzen and Buzen districts; 20,000 tons, Amakusa (Hizen district), and 12,000 tons from Horonai (Hokkaido).

A YOUNG MAN named Winters, who resides in Oakland, became blind in one eye, and is threatened with the loss of sight in the other, from looking at the eclipse Jan. 1st without protecting his eyes with smoked glass.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

TRIPP MINE.—*Dispatch*, Feb. 2: The ten-stamp mill on this mine was started last week. They have the benefit of free water from the Mokelumne river. The owners claim with the light expense attached to working the property that they can make money on $1.50 rock.

LIVE OAK.—This mine, 2½ miles west of Jackson, is looking well. The shaft is down 180 feet. A winze is being sunk from the bottom tunnel which is now down 30 feet; at the bottom of the winze they have a ledge 18 inches wide. The little two-stamp mill pounds away as big as life and crushes its five tons per day. It was manufactured by Donnelly & Co. and cost only $700. Seven men are employed at the works; the rock pays from $10 to $15 per ton. Parker and Thomas have certainly a fine prospect.

MECHANICS MINE.—This claim is on Gopher Flat one mile north of Sutter. It is owned by a corporation, there being 33,000 shares of stock in the plant. An English company is now negotiating for a bond on the mine for $40,000.

BELL WETHER.—Everything is progressing nicely at this mine. It is situated in Bright's field, about half a mile from town, and is worked by a tunnel.

COSMOPOLITAN.—East crosscut 190 feet, face in soft slate. West crosscut in 70 feet, face in hard slate. The south drift is on ore 15 feet wide; just started drift north on ledge. They have been closed down for a few days on account of boiler leaking very bad. A new boiler has been purchased in San Francisco.

NORTH CALIFORNIA.—These people are still running their mill, but the scarcity of water will soon close them down. They use water from Dry creek, and a dry winter makes the water supply short.

GOVER.—The new water-hoist will soon be ready. The mill is now run with 30 inches of water. Mr. Call, the superintendent, thinks that after the pipe stops leaking he can run with 25 inches.

OVERPLUS.—They are still taking out ore at this mine, but the mill has closed down again. A good stamp-mill is needed at this mine to make it a paying property.

DRYTOWN CON.—Work began on this mine Feb. 1st. There has been considerable delay on account of the books, which were not correct at first.

HECTOR MINE.—This company has levied assessment No. 1. The object is to raise funds to supply the mine and works with permanent motive-power, and to develop the property in a systematic way.

KENNEDY.—The north shaft is being driven down as rapidly as possible. When 200 feet deeper it will be same depth as south shaft, 1050 feet. A connecting tunnel will then be run from shaft to shaft. The tunnel north of the north shaft is in 500 feet; it is the intention to run the same in 500 feet more to the line of the Oneida, thus prospecting the whole north end of claim.

MISCELLANEOUS. — *Ledger*, Feb. 2: Another rich pocket was taken from the Reed and Askey mine this week. Mr. Askey brought to Jackson a pan full of rock carrying one-third of its weight in gold. This is the richest find yet made in that promising mine. Eli Gardener has bonded his ranch, including two mining claims for two years for $15,000; 10 per cent to be paid in one year. The parties taking the claim are from San Francisco. At the Alpi mine everything continues to look very favorable. The work is now confined to running a tunnel to tap the shaft at a depth of 50 feet. The rock and gouge in this tunnel improves daily. The Plymouth Consolidated will soon get to work on a scale of magnitude approaching its most prosperous days.

Calaveras.

ABANDONED. — Calaveras *Chronicle*, Feb. 2: Operations have ceased at the A and B mine in Poorman gulch. An incline was run to the depth of about 900 feet, and as no gravel was found, we understand the company has decided to abandon the mine.

ALBANY FLAT.—*Mountain Echo*, Jan. 30: Work is progressing finely at the Whipple mine near Albany Flat. The mine is bonded to Mr. Peet, who is now prospecting the property with a view to buying it. The mine is making an excellent showing, in fact, far above the expectation of its manager. The machinery which was recently erected on the Brunner mine, at Albany Flat, was started up one day last week. The works are run by steam-power. The mine is under the management of Mr. Thomas Machell, who has the property bonded. The mine has been freed from water, and the shaft is being repaired preparatory to sinking. The shaft is at present about 60 feet deep.

Inyo.

SILVER.—Inyo *Independent*, Feb. 2: A rich strike of silver ore is reported in the Flag Staff mine, near Swansea, owned by C. Meysan of Lone Pine. The parties leasing the mine will soon make a shipment of ore that assays 200 ounces silver per ton. Felix Meysan and two others are taking very rich ore out of the Coalburner mine, in the same neighborhood. There is a wagon-road within a quarter of a mile of the mines, making shipments very easy, and the boys ought to make a good stake.

DARWIN MINES.—Jack Wilson makes a favorable report of the Darwin country. He says a number of chloriders are at work there and are doing well. Considerable deadwork is being done in the Defiance and some ore taken out. Mr. McKenzie is taking out ore at the Lucky Jim. Mr. Fitzgerald is working a number of men at Lookout and Mr. Wilson says he is doing well. Mr. Farringdon has secured some mines belonging to Mr. Wilson and will fully develop them. Altogether the outlook for Darwin is brighter than for some time past. It is reported that George Lewis has struck it rich.

Mono.

BENTON.—Inyo *Register*, Jan. 28: We learn that affairs in Benton are much the same as for some years past. An encouraging fact, however, is the fact that the Diana mill, recently burned, is to be rebuilt; part of the framework is already in place. It is being put up on the old site. J. F. Millner is now below looking after the interests of the enterprise. Some ore is being taken out all over the hill. A shipment of six carloads of good ore was sent up the road last week by Mr. Millner.

BODIE MINES.—Homer *Index*, Feb. 2: A wire cable 1500 feet long has arrived for the Lent shaft. This is an indication that they will sink the shaft deeper. It looks more like true business than anything that has been done for some years.

MONO.—During the past week the east crosscut from the south drift, 1200 level, was extended 26 feet. The west crosscut from the south drift was advanced 22 feet.

BODIE CON.—During the past week the north drift, 1200 level, was advanced 27 feet. The upraise from the same level was extended 7 feet. The west crosscut from the north drift was driven 24 feet.

BULWER CON.—During the past week the south drift, 200 level, was driven 18 feet. The north upraise on the same level was advanced 12 feet.

STANDARD.—The upraise on the 300 level was advanced 15 feet; the east drift north was advanced 13 feet, and south drift 17 feet. The mill is running steadily. Bullion was shipped on the 21st of Jan.

Nevada.

OMAHA MINE. — Grass Valley *Union*, Feb. 1: The Omaha and Lone Jack Consolidated mine is making an excellent showing at the present time, having good ore both north and south of the shaft. In the No. 9 level north the lode is nearly four feet in width and of fine quality, something which was not expected when work was recommenced on the mine. Connection has been made with the Lone Jack workings on the No. 5 level, but another drift is now being run on the No. 7 level, which will open up new ground in the Lone Jack where it was never before exploited. The working force of the mine, underground and surface, is nearly 100 men, 67 of them being on the payroll of underground workmen. There are but few tributers employed in the mine. The 18 stamp mill is kept regularly going, being driven by water-power with Pelton wheel attachments. No noise is being made about the Omaha, but the stockholders are satisfied with its appearance and the successful management of Supt. George Mainhart.

THE BALTIC "SCHEME." — Nevada *Transcript*, Feb. 2: The Baltic Consolidated Mining Co., lately incorporated, consists of three locations in the Eureka mining district, Nevada county. The Baltic may be all right, but there are people hereabout who do not have much confidence in it as a legitimate mining operation. If any of the stock is put upon the market it would be a sensible idea for intending purchasers to make a careful investigation as to the property and the men at the head of it before they invest.

VALLEY'S BRIGHT PROSPECTS.—*Tidings*, Feb. 1: In the course of a year the entire group of mines in the Allison Ranch locality will be in operation. Already the Omaha and Lone Jack Con. is being profitably worked, after years of idleness, and the Hartery, bonded to A. W. Stoddart, will be started up early in March. Mr. Davis, owner of the once famous Allison Ranch mine, is authoritatively reported as saying he will himself reopen that property this year, if not quickly sold at his own figure, and now the Menlo ground, lying between the Hartery and the Omaha and Lone Jack Con., is once again to be the scene of bustling activity. The Homeward Bound and Wisconsin (Illinois) claims comprise what is known as the Menlo ground, and consolidated, constitute one of the best ventures in this great mining district. Thirty years ago the Wisconsin was the richest mine in the neighborhood—a specimen vein—and, although not worked to a depth of 300 feet, thousands on thousands of dollars were extracted. A few years ago the Wisconsin and Homeward Bound were consolidated and the Menlo Co. of New York took hold of the property. Beyond erecting a first-class pumping and hoisting outfit on the Homeward Bound shaft and cleaning out the shaft, which is less than 200 feet in depth, nothing was done. Not a ton of ore was extracted, the company meeting with reverses elsewhere and becoming bankrupt. In passing, a word about the Homeward Bound ledge is not amiss: There are two parallel veins, one of which is four feet wide and of average ore, while the second vein is of good size and quality. The mine was never properly managed, as we regard mine management in these days. After the Menlo Co.'s failure, the consolidated property became, and is now, the property of Messrs. M. C. Taylor, J. M. Lakenan, Peter Johnston and H. Silvester, who have bonded it for $75,000 to Messrs. Abadie and Wiltze of the North Star. The bond is to endure for two years, and Abadie & Wiltze are to expend $3000 within three months from date. As the plant on the Homeward Bound is in good repair, this means that active operations are to be instituted forthwith, and it is further stipulated that work must be carried on continually, or else the bond shall be void. We reassert that without doubt the entire group of mines in the Allison Ranch locality will be in full operation ere 1889 shall have passed away. The success that has attended the reopening of the Omaha and Lone Jack has brought about this bright prospect, but the present era in Grass Valley's prosperity dates from the reopening of the Empire; the impetus thus given was stimulated by the success crowning the renewal of operations at the North Star, and next came the Omaha and Lone Jack. Now we are to witness the reopening of the Homeward Bound and Wisconsin, the Hartery, and the Allison Ranch. The pumps will soon be at work at the Coe, the Evening Star is slowly being provided with machinery, the Green Mountain is full of promise, the Idaho is good for several years to come, and the Maryland is positively an undeveloped Idaho. Arrangements for the working of other old and new mines are under way, and, in short, our belief that Grass Valley's mining interests will alone increase the district's population to 10,000 souls within the next five years is about to be verified.

Placer.

GOLD DUST.—Placer *Herald*, Feb. 2: General Hamilton has succeeded in controlling the water in the Dardanelles, and the old mine is now turning out lots of dust.

San Diego.

JULIAN MINES.—*Sentinel*, Jan. 30: Work has again been resumed at the Owens mine, and this time in a business-like manner. Alfred James of Los Angeles, one of the owners of the property, arrived in this city Monday evening, and at once advertised for bids for sinking a new shaft and for retimbering the old one. James Courtney secured the contract for sinking the new shaft to a depth of 100 feet, and will commence work some time next week. It will take about 30 days to sink the shaft to the depth called for in the contract, and in the meantime men are engaged in retimbering the old shaft, and when that is done the water will be pumped out and operations begun in the old works. The new shaft will be sunk about 300 feet from the old one, so there will be no danger of coming in contact with the old drifts. The new shaft is to be a double compartment one, and will be timbered with extra heavy timbers. A new hoisting works is to be put up, a new blacksmith shop built, and other improvements made. The timbers for the mine are being sawed at Shaw's mill, the first load of which will be delivered at the mine to-morrow. The news of the reopening of the Owens mine has given new life to our people, and already there is talk of starting up other mines in Julian. In fact, Robert Gardener has already commenced operations on the Blue Hill tunnel, which he intends running in 1500 feet. The Golden Chariot mine will in all probability start soon, as will also the Ready Relief, and the Gold King, the Ella, Hidden Treasure, Fredericks, and a score or more others are now taking out rich rock.

Shasta.

ATTRACTING ATTENTION.—Redding *Free Press*, Feb. 2: H. P. Holland, one of the owners of the Clipper mine on Squaw creek, arrived from San Francisco on Monday and started for the mine the next day to resume active operations. He informed us that Shasta mines, especially those on Squaw creek, are attracting great attention among mining men in the city.

SOUTH FORK, CLEAR CREEK. — Cor. Shasta *Courier*, Feb. 2: Messrs. Hubbard & Kitchen are sinking on a promising ledge near the mouth of Kanaka creek. The ledge prospects along the croppings for over 1000 feet. Eubank's arastra is running on ore from the Live Oak. The contractors are getting on slowly with Gibney's tunnel, the rock being extra hard. Gibney is also sinking an incline on the ledge. J. P. Wright's arastra is running on ore from his mine. Shirland Bros. are running their arastra on Atlantic ore. E. L. Ballou is running his arastra on Falls ore, he having found a large and promising mine east of the old works. W. P. Litten talks of putting up an arastra to work his free ore. Tom White of Igo has sold his claim to a Chinese Co., which has about completed a hydraulic outfit to work the same.

LOWER SPRINGS.—Jo Penrose and Sam Gruber have located a claim on Middle creek, commencing at the bridge and running south 3000 feet. The ledge is ten feet wide, and mostly sulphurets, which show up well. Assays have been sent to different parties. This claim will be known as the Non Such. They have a mine called the Harrison & Morton, which shows flattering prospects. They have a shaft down 20 feet, but cannot sink for water.

Sierra.

FOREST CITY. — *Mountain Messenger*, Feb. 2 The fair weather we have been having of late has been a great drawback to the mines in our surroundings on account of the freezing up of the water. The Ruby mine had to lay off its men during the frosty snap, but started again last Monday. The Red Chief quartz mine, in Kanaka ravine, got up steam in their mill Monday. Everything seems to be working in a very systematic manner, under the management of Prof. L. J. Lewis, superintendent of the mine. The contract for running 60 feet of a drift to right of main tunnel, and sinking to bedrock at a depth of 15 feet in the South Fork mine, was completed a few days ago.

THE HOOSIER LEDGE.—*Tribune*, Feb. 1: The Hoosier claim, situated across the river a short distance from town, is looking well. Three men are at work there and at present they are taking out just enough rock to pound in a mortar each day. The rock is so rich that with this slow way of extracting the gold the men are making daily wages of $4 each. Who says Sierra City district does not beat the world for good mines and rich prospects in quartz?

THE MARGUERITE.—F. Morris, superintendent of the Marguerite mine, is expected to arrive here from below to-morrow. It is said that he is going to remain, and that the mine will be started up shortly. A Cornish pump has been ordered, and as soon as that arrives (which will be soon if the weather permits), it will be put in and work resumed the same as before. Mr. Morris will settle with those to whom the company is indebted for labor, etc., when he gets here.

THE BUFFALO.—The owners of the Buffalo mine at Hog canyon have reason to feel confident that their mine will be one of the best paying properties in Sierra county. Its future is in sight, and anybody who understands quartz mining cannot help but see it. The rock proves to be rich wherever they go. Last week in raising on the ledge from tunnel No. 2 to tunnel No. 1 an immensely rich body of ore was encountered. The rock shows any amount of free gold. The 10-stamp mill is completed, but is not running as yet. The company has not been able to start it up on account of the scarcity of water. There is three feet of snow in places up there now, and there will have to be more storm before there will be sufficient water to run the mill. The company can see now where they made a mistake in not putting a boiler and pump in this winter, instead of trying to run the mill until spring with water-power. If they had done this the mill would be running in full blast now. Fifteen men are employed at the mine at present, and as soon as spring comes the force will be increased to a much larger number.

GOOD LEDGE.—The Salinas & Mercer Co. has opened up a fine-looking ledge in their lower tunnel. It is three feet wide. The tunnel is in a distance of 350 feet.

CONTRACT LET.—George Watkins of the firm of Spellenberg & Watkins of this place, received the contract advertised by the San Luis Mining Co., to run 200 feet farther on the drift at the mine. He took the contract for $3 a foot.

Trinity.

KNOW-NOTHING CREEK.—Cor. Trinity *Journal*, Feb. 2: This is comparatively a new mining district; for both quartz and placers it promises well; the ledges are gold bearing and compare favorably with other ledges in the northern counties. There are five quartz mines working; four of them are bullion-producers. The Hansen, Wolverine, Know-Nothing and the Hungry Hill mines are in a flourishing condition. The most promising of these is the Know-Nothing; the mine is prospected from two levels and a shaft. The shaft is 30 feet deep from the surface, and shows a good strong ledge; the upper level is 70 feet below the bottom of the shaft and runs in on the ledge 160 feet, the ledge showing an improvement on this level; the tunnel will connect with the shaft by an upraise very soon. The lower level is 70 feet below the upper one, making a depth of 170 feet from the surface. This tunnel is in 30 feet on the ledge, which is four feet in width in places and averages about 20 inches. As depth is attained the ledge grows stronger. Tracks are laid on each level and cars bring out ore and waste. The ore is dumped into a bin with a capacity of 100 tons; it is taken from thence to an ore bin at the foot of the hill 357 feet distance by cable cars. This dump, or bin, has a capacity of 20 tons. The ore is then taken in cars on a level track 150 feet to a chute 60 feet in length, on an incline of 45 d grees, into the mill. The mill building is 45x20 feet, with a battery put up for eight stamps, four of which are in place and ran seven days. The ore can be transported from mine to mill for eight cents per ton. The mill and mine are under the superintendency of Mr. P. P. Black. There was, at the time the mill commenced crushing ore on Jan. 8th, 400 tons on hand and enough in sight in the mine to run the mill two years; the mill has a capacity of six tons per day. This mine will give a good account of itself in the near future.

EAST FORK.—*Journal*, Feb. 2: Capt. Trueworthy was in from East Fork the first of the week and gives us the following items from that district: He is working a force of men on the North Star, with Jas. E. Given as superintendent, and is developing a valuable piece of property. Two tunnels have been run in 100 feet on the main ledge; side drifts extend from the main tunnels about 75 feet. Besides development work, he is taking out ore and crushing it. The ledge from which the ore is taken averages 3½ to 4 feet in width. On the smaller ledge is a tunnel 130 feet long. There is a five-stamp mill on the mine and it is now running. The partial cleanups have been highly satisfactory. There are 100 tons of ore on the dump and a large body of good ore in sight. With a 40-stamp mill the property would be one of the best paying in the county. Capt. Trueworthy is also running the arastra on Barney gulch on quartz from the Thanksgiving and Fountain Head mines. Day & Greenwell are taking out ore from the Ozark, situated on Rich gulch, and will begin crushing in a few days. The ore of the Ozark is high grade, averaging $100 to the ton. The Enterprise is running with a good force of men. The mine is being opened and developed so as to be ready for the stamp mill which the company will put on in the spring. The arastra is crushing $100 rock, and yields the company a handsome dividend after paying running expenses. Work is progressing on the Yellowstone, under the superintendency of E. C. Paxton; the mine is being developed and ore taken out and crushed in the arastra. From all reports the mine is looking well and will prove a bonanza. The Niagara M. and M. Co. own the mine and will put up a mill in the spring as soon as the wagon-road is completed.

Tulare.

QUARTZ.—Visalia *Times*, Jan. 31: About 17 years ago James Mankins discovered a quartz vein three miles north of the road to Comstock's mill, on Rattlesnake creek. Free gold was plainly to be seen in the croppings, and every piece of ore that was tested yielded a color. During all these years Mr. Mankins has occasionally prospected the vein, which has been traced for a distance of 5000 feet, and every test made of the rock has been highly satisfactory. Recently W. R. Corrington and James B. Jordan have become interested in the property, and this week Messrs. Corrington and Mankins brought 25 pounds of the ore to Visalia. Samples of it were horn-spooned at Nanscawen's drug store on Tuesday, and the results exceeded all expectations. The owners of the property have purchased blacksmithing and mining tools, a supply of provisions, etc., and will proceed to the mine this week for the purpose of beginning the work of development. Five claims have a ready been located on the lead, the original being named the Rusty Crust.

Yuba.

SMARTSVILLE BOOMING.—*Herald*, Feb. 1: At present Smartsville is booming along gloriously on the road to prosperity, and we are glad of it. The people there are energetic and are rapidly emerging from the "Slough of Despond" into which they were cast by the anti-debris decision a few years back. They have opened drift mines and already 50 or 60 men are given employment, many of them being from French Corral, Sweetland and other places along the ridge below San Juan.

NEVADA.

Washoe District.

CHOLLAR.—Virginia *Enterprise*, Feb. 2: The west drift from the shaft on the 750 level is out 441 feet. The face is in clay and porphyry. The north raise on the 650 level is up (on the slope) a distance of 121 feet. West crosscut No. 2 on the 550 level is out 65 feet. The face is in quartz of no value.

POTOSI.—On the 650 level west crosscut No. 2 is in 82 feet, with clay and quartz in the face. East crosscut No. 3 is in a distance of 85 feet, and shows quartz and porphyry in the face.

SAVAGE.—On the 400 level the main west drift has been advanced 22 feet. Southwest crosscut No. 2 has been advanced 25 feet. On this level, from the old stopes on the north and south drifts are now extracting a considerable amount of ore. In the joint crosscut on the southern boundary they have encountered two feet of good ore. On the 500 level the main west drift has been extended 19 feet. No. 2 west crosscut, on the 500 level, is in quartz, giving low assays. No. 1 east crosscut on this level and the north and south drifts are being extended; also Nos. 2 and 3 on the 600 level. Since last report have shipped 850 tons of ore to the Rock Point mill; average of battery assays, $20.

HALE AND NORCROSS.—The north drift on the 500 level has been advanced 140 feet. It continues in good ore. All the stopes on this level are yielding ore of good quality. The winze, below the track floor of this level (500) is down 40 feet, and is still

in good ore. All the stopes from the 600 to the 700 level are looking well, and supplying the usual quantity of ore. On the 1300 level the north drift continues in low-grade ore. Since last report have milled about 1200 tons of ore. It was worked at the Mexican mill and averaged $22.50 a ton.

NORTH OCCIDENTAL.—Some paying ore is being mined on the 250 level. A large body of quartz has been encountered on this level, in the north drift.

SIERRA NEVADA.—The exploring drifts on the 520 level are still in low-grade vein material.

UNION CON. AND MEXICAN.—Good headway is making in the joint north drift.

OPHIR.—The crosscut on the 1465 level is still in vein porphyry. In places are found some promising stringers of quartz.

CON. CAL. AND VIRGINIA.—Ore is being extracted on all the levels from the 1400 down to the 1950 level. The most productive stopes, however, are those on the 1650 level. The usual amount of ore is being shipped to the river mills.

GOULD AND CURRY.—The west crosscut on the 450 level is still in vein material carrying some metal. The east crosscut on the same level shows streaks of quartz in a mixture of clay and porphyry.

BEST AND BELCHER.—East crosscut No. 2 on the 350 level is in vein material carrying some metal, and the south drift is passing through stringers of quartz. In the west crosscut on the 400 level a large body of quartz has been encountered, which yields low assays.

UTAH.—The south drift on the 600 level is passing through material giving low assays.

OCCIDENTAL.—Some good ore is being extracted on the 300 level; also below on the 450 level.

BALTIMORE.—A good deal of milling ore is being accumulated on the 300 level.

BENTON.—Are arranging for a hoisting plant.

JUSTICE.—Mill running regularly and bullion shipment beginning to be made.

CONFIDENCE.—All the ore-producing sections looking well. Are shipping 450 tons a week to the Brunswick mill. Average battery assays $28 a ton.

ANDES.—Good headway is making in cleaning out and repairing the old drifts on the 175 level.

OVERMAN.—Are sending the usual quantity of ore to the Vivian mill, Carson river.

BELCHER.—A good deal of exploring work is being done on the several levels from the 200 down.

CROWN POINT.—The work being done is principally in the way of prospecting and repairing.

YELLOW JACKET.—The mine is looking well and regular shipments to the mills are continued.

IMPERIAL.—No. 2 east crosscut on the 1100 level is still in vein material of a promising character.

CHALLENGE.—The north drift on the 300 level is showing a mixture of quartz and porphyry in the face. Are still shipping 150 tons of ore a week to the Brunswick. The battery assays average $28 a ton.

Columbus District.

THE MT. DIABLO.—Walker Lake *Bulletin*, Feb. 2: Have stopped the east drift below the fifth level, and have started a south crosscut from it. The stope between the fifth and sixth levels does not look quite so well. The ore body is somewhat smaller in the stope above the fifth level near the No. 1 winze. The main stope between the fourth and fifth shows two feet of $60 ore. The west drift from the south crosscut between the fourth and fifth levels is in five feet and the face shows 18 inches of $60 ore. Are driving a south crosscut between the third and fourth levels near the No. 1 winze, and the face shows a small amount of $80 ore. This crosscut is in 32 feet. A little ore is being extracted from the intermediate above the east drift on the third level. The stope east of the shaft between the first and second levels looks well and is giving some $80 ore. The mill has been running steadily during the week and working the ore to a high percentage. Are now crushing more ore than for some months past.

Pioche District.

EXPECTATIONS.—Salt Lake *Tribune*, Feb. 2: W. S. Godbe has sanguine expectations as to the future of Pioche. He says two mines alone have yielded $15,000,000 within four years, and the outlook is so favorable that Pioche bids fair to develop quicker than did Park City, and will be one of the greatest mining camps in the West. Things will start as soon as the railroad gets in there.

Tuscarora District.

BELLE ISLE.—Tuscarora *Times-Review*, Feb. 1: South drift from east crosscut, 250-foot level, extended 10 feet. The vein is not so large and shows an improvement in grade.

FOUND TREASURE.—A prospect shaft is being sunk near apex of vein between the whim shaft and the Cowles shaft to explore the body of chloride ore existing there.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—The formation that the shaft is passing into is very favorable for ore.

GRAND PRIZE.—400-foot level: North crosscut has been extended a distance of 16 feet. Formation is more favorable for progress, and intersected with seams of quartz.

NORTH BELLE ISLE.—Winze from the 400-foot level has been sunk 15 feet; total depth 88 feet. No material change in the flow of water or character of rock. After reaching the depth of 105 feet will commence crosscutting.

NAVAJO.—The usual output of ore has been made from the various stopes. Shipped last Monday, $14,696.76.

NEVADA QUEEN.—The concentrating-works has run steadily, doing good work. Will be shut down for a few days to enlarge the ore dump, as at present it is impossible for teams to get in any amount, and causes extra expense dumping outside. The north drift, 450-foot level, has been advanced 18 feet through vein matter giving low assays.

COMMONWEALTH.—225-foot level: No. 1 west crosscut has been advanced 13 feet; a connection has been made with No. 1 winze from 150-foot level, exposing 16 feet of ore. A drift has been started from this crosscut, following the ore north. No. 2 west crosscut has been advanced 18 feet in the vein, giving low assays. Line crosscut has been advanced 7 feet, the rock is hard. 300-foot: No. 1 west crosscut has been advanced 19 feet, encountering small seams carrying sulphurets, and looks favorable. Gangway has been extended 4 feet, with but little change.

ARIZONA.

HARQUA HALA.—Cor. Tombstone *Epitaph*, Feb. 2: I reached this camp a few days ago. It is not all it is blowed up to be. I see a few good surface prospects; one of them is a four-foot hole on the big mine. There is nothing done here to show whether they have got a mine or not. I saw one big nugget they picked up, but that does not say whether it is going to make a mine or not when they go down. I think it will be quite a while before the camp is prospected. There are some men here who have located 20 claims. The boys that have made the rich strike can make a good raise whether it goes down or not. This is a very poor place for a man to be if he is not well fixed. There have been rich pockets of gold struck before, through this part of the county.

MOHAVE MINES.—Kingman *Miner*, Feb. 2: D. W. Grant had a shipment of ore from the Juno mine, Chloride, worked at the sampler this week. Kelly & McKinnon are sacking a carload of ore at the Conner mine. The roads are in good condition after the recent storm. The C. O. D. and Stockton ore-teams are making regular trips. It is expected there will be considerable ore brought in during the next two weeks, as it has been accumulating for two months at some of the smaller camps. Chas. Cummings had two carloads of ore from his recent find near Wallapai springs worked at the sampler this week, some of which worked 180 ounces. Bob Kier and partner have struck some good ore in Jack Johnson's claim between Oak Creek ranch and Cerbat. The Flores well has reached a depth of 154 feet. There is an abundance of water to run the mill night and day, and the management is making arrangements to that end. Wilkinson & Tourtellotte have about 60 tons of $40 gold ore on their dump, near the Flores, and plenty more of the same grade in sight. They are unable to make arrangements to mill it at Cerbat at present, and consequently they are devoting their energies to extracting ore of a higher grade which will stand shipping charges. The recent strike in the Nighthawk proves to be the richest ore body yet discovered in this mine. This body of ore was discovered in virgin ground, and at a depth of more than 300 feet.

COLORADO.

TUNNEL.—Georgetown *Courier*, Feb. 2: The Hall tunnel has been driven nearly 1200 feet. Five-hundred-ounce ore is coming out of the Everett. Work has been started on the Muscovite lode, Ute creek, by Henry Mears. Capt. Ezekiel has been appointed superintendent of the Mary Foster mine. The Miners Works has been running a six-car lot of ore from the Mendota this week. Development work is being pushed on the Aliunde, and some very good ore is coming out. Thirty-five thousand pounds of ore was milled from the Jo Reynolds last week. The mine is producing nearly 20 tons a week. Gabriel Bartholomea, lessee on the Burleigh, has sold his ore to the Holden Smelting Works. He has about 200 tons on hand. The ore mills from 45 to 55 per cent lead, and from 30 to 35 ounces silver per ton. The Mineral Chief lode, Republican mountain, was recorded the first day of August last. The first shipment of ore was made on the 14th of the same month. Up to Jan. 1st 200 tons were shipped. The average value of the ore is 55 per cent lead, 13 ounces silver, and 1.10 ounces gold per ton. A pretty good record for a prospect.

DAKOTA.

CUSTOM WORK.—Deadwood *Pioneer*, Feb. 2: Reports from apparently reliable sources tell us in the event of the present reduction works successfully treating Ruby ore by Clark's process, that company will increase its capacity from 50 to 100 tons per day during the coming summer. Also that a custom works having a capacity of 100 tons per day, will be built by another party in the vicinity of Deadwood. It is reported that the Harney Peak Tin Co. of New York has abandoned the idea of selling its property in England.

BRITISH COLUMBIA.

THE TOAD MOUNTAIN COUNTRY.—Donald *Truth*, Jan. 30: The following is the latest news of the mines in the Galena Bay and Hot Springs districts. These camps present a very busy aspect this winter. About 100 men are at work, and many others are in there, so as to be the first on deck in the spring when the boom is sure to strike that section of Kootenay district. As to the claims, work is progressing well and developments fully equal expectations. The Blue Bell claim at a depth of 126 feet shows 40 feet of concentrating ore, with ore still in the face of the crosscut. As depth is attained the ore increases in richness; on top it only ran from $12 to $20 a ton in silver, while the ore taken from the bottom of the shaft runs from $25 to $40 a ton. This is the big claim of the camp. As to other mines, on the Krao a force is at work sinking a shaft that is expected to tap the vein at a depth of 70 feet. The ore from the claim is a rich sulphide, carrying wire silver. The No. 1 claim is being opened by a tunnel to tap the vein at about 200 feet depth. The surface work resulted in the shipment last fall of 20 tons of $200 ore, and when top work ceased the prospects fully justified the driving of the tunnel 200 feet lower. The work is being pushed with a vim. The Little Donald is being opened with a good-sized crew of men. It shipped 40 tons of $75 ore last fall and at present could duplicate the shipment. All work is done directly on the ledge, which is large and reasonably soft; still water has retarded progress somewhat. The ore has steadily improved in value, one small seam running about $1300 per ton, while the bulk of the ore will go $150 to the ton. Of the Gallagher group of claims, the Let Her Go Gallagher is being opened by a force of six men, who will soon drill from the shaft and tap the vein at a depth of 70 feet. Fifty-two tons of $115 ore were shipped from this claim last fall; it all being mined and sacked by one man in sinking 18 feet, and he taking it out fast enough to keep a 15-animal pack train at work getting the ore to the lake. The Daddy Gallagher has been sunk on 24 feet, and shows about the same characteristics as the Let Her Go Gallagher, but the ore so far is not so high grade nor so abundant. On a number of other claims the assessment work is being done.

THE JUBILEE DISTRICT.—Under date of the 21st, Jones & Wells write from their camp on the western slope of Jubilee Mountain: "We have discontinued taking out ore from the surface and are now running the old tunnel in the Spilimichene claim as fast as three shifts can force it. Expect to have the ledge crosscut by spring, and at a depth of 200 feet. We are in hopes then of being in a position to ask no odds of any smelting company."

IDAHO.

BIG CLEANUP.—*World*, Feb. 1: The Elkhorn mine is developing into an astonisher of the first magnitude. Hugh Turner came to town last Saturday with another long purse full of the yellow metal. The mill, a five-stamp, ran 14 days—not days of 24 hours, as it did not run nights—and the result is $6000. The cleanup before this, two weeks ago, was $6000 for a 19 days' run. In speaking of the run of a quartz-mill, a day is always understood to be a day of 24 hours—day and night. Six thousand dollars for a seven-days' run is magnificent with only a five-stamp mill. The Elkhorn is getting richer and richer, and now equals the records it made in early days.

NEW DISTRICT.—Idaho *Avalanche*, Feb. 2: We understand that a new mining district and a gold-bearing lode has been discovered somewhere in this county, about 20 miles from Silver City, which promises in the early spring to make some excitement. Ore broken from the croppings of one of the lodes assays over $100 per ton. We will probably receive a few samples of ore from this new district in a short time, when we can tell more about it. The district will probably be called the Spur mining district.

ORO FINO.—The Oro Fino mine is said to be looking better than it has at any time since passing into the possession of the Oro Fino Limited, of London, England. The levels are now being opened up in good shape, and fine ore in sight in various places.

MONTANA.

MEN EMPLOYED.—Butte *Inter-Mountain*, Jan. 30: Some idea of the mining industry of Butte can be gained by the knowledge of the number of men employed underground by some of the leading mines of the camp. A partial list of them is as follows: Anaconda 320, Mountain Con. 190, High Ore 160, Wake-Up-Jim 160, Moulton 35, Lexington 80, Alice 50, St. Lawrence 200, West Colusa and Colusa 100, Mountain View 60, Modoc 70, Bluebird 70, Gagnon 60, Parrott 60, Gray Rock 30, West Gray Rock 15, Amy and Silversmith 15, Magna Charta 30, Union Con. 10, Fraction 7, Moose 20, Original 16, Speculator 25, Black Rock 12, Silver Bow 12, Gambetta 14, Burlington 25, Nettie 25, Volunteer 30, Pacific 30. Even the above gives but a small idea of the men at work underground in the camp. Besides these mines there are upward of 200 properties being worked under lease and otherwise.

ROCHESTER DISTRICT.—E. Mueller was in from Rochester yesterday, bringing the product of his ten-stamp mill for shipment. Mr. Mueller has half a dozen claims, which are situated about a mile and a half from Rochester. The principal ones are the Watseka and the Emma, both located on the same vein. On both these properties Mr. Mueller has sunk to the depth of nearly 200 feet. The vein is from 2 to 4 feet in width, and the rock carries gold and silver in about equal proportions to the value of $25 a ton. He has invested $20,000 in development and machinery and is just beginning to reap the benefit of his work.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, Feb. 2: The output for the week ending Jan. 30th was 35 bars of bullion, containing 56,928.12 ounces of silver and 58.04 ounces gold.

WEST GRANITE.—It takes time to stope, sack and ship ore. The old days of small carloads are rapidly passing away. At one time 10 tons was figured on as a large load; now 20 tons and over loom up, and 40,000 pounds weight is disposed to trespass on the springs.

OREGON.

RYE VALLEY MINES.—Bedrock *Democrat*, Jan. 28: We understand that Harry B. Franz, one of Baker City's pioneer prospectors, has recently visited the old camp of Rye valley and relocated several abandoned mines, from which he has obtained some very rich ore. It has been a matter of record for many years that rich quartz veins abounded in that vicinity, and at various times numerous locations there have been worked and the ore yielded handsomely. But for the past ten years the camp has received little or no attention. Mr. Franz has succeeded in getting some of Baker City's most prominent business men interested with him in his locations, and they will doubtless develop their properties at once.

BAKER CO. MINES.—Brodrock *Democrat*, Jan. 28: The Oregon G. and S. Cons. Mining Co. at Cracker creek, under the superintendency of C. M. Donaldson, is being worked by 30 miners, and a fine body of ore is in sight. The management is making every preparation to work the E. & E. mines on an extensive scale with the opening of spring. The Columbia, H. Stevenson, superintendent, is also being worked by a large force, and that force would be increased if experienced miners could be obtained. This company is also putting itself in readiness for opening out on a grand scale in the spring. The Gray Eagle, owned by Murphy, Young & Co., is showing up a rich and extensive body of ore and gives every evidence of being an immense bonanza. J. B. Cabell, one of the owners of the celebrated La Bellevue mine at Granite, is in the city and reports everything satisfactory at the mine. The ledge of the La Bellevue is widening out and becoming richer as development work progresses. The pulverizer and concentrator are kept running night and day, and there is enough ore in sight to keep them running for months to come. The Monumental mill is expected to commence crushing this week on ore from the Monumental mine, which is said to be showing a fine body of ore. The mill will also be run on the custom plan and will doubtless prove of great benefit to the mine-owners in the near vicinity. A rich strike is reported from Rock creek, west of Baker City, made by Chas. Casebeer, the ore lassaying $44,600 to the ton. Lorenzo Durkee is in receipt of the following assays made from ore from the Gera mine at Cracker creek: 8.40 oz. silver; 11.60 oz. gold; value of gold, $232. Total, $240.40 per ton. Silver, 6.05 oz.; value of gold, $100.04. Total, $106.09 per ton. Mr. Durkee intends doing extensive development work on the property in the spring. We understand that Hoffman & White, contractors on tunnel work on the Hurricane mine, recently purchased by George Thompson, have uncovered a very rich vein of ore right at the commencement of their contract. The mine will no doubt develop into a very valuable property. The different owners of mining property at Granite are pushing development work this winter, and upon the arrival of spring these properties will be ready for inspection by capitalists. Edward Hardy of this city is negotiating for the purchase of the extension of the Big Aleck mine in Pocahontas district. The sale of the Graham and Tabor & Tracy mines in Cable Cove district is being negotiated with an Eastern syndicate, and with a very fair prospect of success. J. S. Sharp is busily engaged working his Pocahontas mining property, and is meeting with great encouragement.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, Feb. 2: The Carlisle smelter has closed down. Uncle Ben Hobson has struck some very rich ore on his Black Hawk property. Since the resumption of smelting at the Flagler works last Saturday, the daily product of ingot copper has aggregated four tons per diem of 24 hours. This copper is regarded in Baltimore as next to Lake, and careful assays show a fineness of 98 per cent. The Carlisle mine at a depth of 500 feet has reserves in sight sufficient to run the mill for three years to come without sinking or drifting a foot.

PINOS ALTOS.—The main shaft on the Minnesota is now 95 feet in depth. The crevice of pay mineral averages 14 inches, and mills $40 per ton. The daily output with the labor of three men now approximates two tons.

MOUNTAIN KEY.—This week's run will be the largest in the history of the mine and mill. The estimated value of the week will exceed $5000 in gold. Ore from 300 level west crosscut on Aztec averages $35 in gold and $5 in silver. The arrival of Hon. R. C. Kerens and party of St. Louis, to-day or to-morrow, will settle the location of a mill for the Pacific Gold M. Co. The mill will contain 20 stamps with power for 40. On the Esperanza, rich sulphides of silver and free gold are occasionally met with. This property is rapidly proving to be a valuable mining claim. The Juniper is one of three claims, on what is popularly known as the Mino Grande lode, one of the great veins of the Pinos Altos system. The assays just completed show a fine and extremely well defined body of ore. The Aztec Co. started up the Bremen mill last Tuesday. The company was compelled to suspend operations owing to the execrable condition of the roads. Now that the weather is settled, the facilities for transportation will be increased and ten days' supply of ore will be kept constantly on hand.

BURROS.—The Emma mine in the White Quartz camp of the Burros mining district, at 22 feet in depth shows a vein of quartz 14 inches in width which has a milling value of $20 per ton.

UTAH.

REVIEW.—Salt Lake *Tribune*, Feb. 2: The week has been dull, but the work in the mines is going forward at a steady rate, and the receipt of ores has been good. The receipts for the week ending the 30th, inclusive, were to the value of $150,306.72 in aggregate, of which $107,841.72 was in ore and $42,461 in bullion. For the previous week the receipts were $32,750 in bullion and $45,769 in ore, an aggregate of $78,519. The Ontario product for the week was of bullion 21,897 55 fine ounces; from ore sales, $37,140.90; an approximate total of $59,028.44. Ontario dividend No. 152, of 50 cents a share (75,000), was paid in New York on the 31st. The Daly output for the week was in ore sales, $8985.23; no bullion. Daly dividend No. 23, of 25c per share (37,500), was paid in this city and New York on the 30th. Horn Silver is working on in a cautious way. No special developments or output are reported. Fine bar receipts in this city for the week were to the value of $20,999; base bullion, $7200. The Hanauer smelter produced during the week bullion valued at $14,275. Ore receipts for the week were to the value of $46,291.72 by Wells, Fargo & Co., and $61,550 by McCornick & Co. Homestake stock, 75 shares, sold in New York on the 22d at $13.50.

WOODSIDE.—Park *Record*, Feb. 2: It is now about five months since Messrs. Wilmans and Drake and associates obtained a year's lease on the Woodside property, owned by Hon. E. P. Ferry. The ore chute, which lays very flat, has been followed into the hill until a depth of 75 feet under the surface has been reached. The vein is dipping to the northwest and it is from 5 to 10 feet thick. Over 1000 feet of drifting on the course of the vein, not counting the stoping, has been done. About 50 men, the usual force, are employed and the big average of ore shipments is kept up as well as the condition of the roads permits. So far the character of the ore has been very uniform. It is a carbonate of fine quality for smelting, averaging 47 ounces silver, 45 per cent lead and $1.50 in gold, to the ton. Up to date about 8,000,000 pounds or 4000 tons have been sent to the smelters, via the Mackintosh sampler, and nearly 2000 tons of concentrating ore are on the dump. The product of the mine thus far has been some $150,000, and at this rate the leasers will have taken out at least $400,000 worth of ore by the time their lease expires next August.

PROGRESS OF THE TUNNELS.—The Anchor drain is now in about 5800 feet and there are only 800 feet yet to run. A splendid rate of progress is being made considering that so much water is encountered in the face. However, it is expected that within two months the tunnel will reach the end. The Ontario big drain tunnel from the east has reached a distance of over 700 feet and the work is being pushed as rapidly as possible.

SCIENTIFIC PROGRESS.

The Rare Metals—Some of the Mysteries of Chemical Science.

Chemists have found about 71 different forms of matter, which they call elements, and are apparently simple forms of matter incapable of further subdivision. We say about 71 different forms, because some of these so-called elements have been but little studied, and resemble each other so closely that they may be proved to be identical, or to be mixtures of still simpler forms. The question of the true nature of the elements has been frequently discussed in these columns, but is not connected with the present subject. Of these 71 elements, 56 are metals and 15 metalloids. It is rather difficult to exactly define a metal; but their general appearance is familiar to every one, and a special article upon this question will be found in the *Science News* for March, 1887. Only about 30 elements are at all common, and not more than 20 are met with in daily life. Sixteen of these are of a metallic nature, leaving 40 different metals which are rarely seen outside of a laboratory or mineralogical cabinet, but which in their chemical relations are of considerable interest.

Beginning with that group of elements containing the familiar substances sodium and potassium, we find three other metals closely allied to them—lithium, rubidium and cæsium. Lithium is more abundant than the other two, and is found in considerable quantity in many mineral spring waters, including those at Saratoga. It is the lightest solid element known, having a specific gravity of 0 59, or about one-half that of water. Cæsium and rubidium were also first discovered in mineral water by Bunsen and Kirchoff in 1860. There were only two or three grains of the metals to a ton of water, and their detection would have been impossible, except for the spectroscope, which showed the blue line of cæsium and the red one of rubidium, when even this minute quantity was present. The metals themselves present no especial peculiarity of appearance, and could hardly be distinguished by sight from a piece of sodium or potassium. In the calcium and magnesium group we find barium and strontium, which, while not very rare, have but few practical uses. Strontium is largely used for making red fire, while barium gives a green hue to the flame. Cadmium is a metal resembling zinc, and is important only as being a constituent of the fusible alloys used for safety plugs in steam boilers, automatic sprinklers, etc.

Aluminum is no longer an uncommon metal; but there is a long list of similar metals which are quite rare, and of little or no practical importance. They resemble each other very closely, and it is by no means certain that they are all distinct elements. The elements yttrium, urbium, terbium, phillipium, ytterbium and samarium are very slightly differentiated, and are compared by Dr. Crookes to the refuse of the universe, "heaped away in some cosmical lumber-room;" while the deceptive nature of another supposed element is expressed by its name, decipium. Gallium and germanium were discovered by French and German chemists respectively; while scandium is remarkable as agreeing in its properties with a theoretical element which was required to fill a vacant place in the "periodic system" of the elements, but was, until quite recently, unknown. Glucinium is found in the emerald beryl, and some of its salts have a sweetish taste. Zirconium is the base of the rare minerals zircon and hyacinth, and thorium is remarkable for its specific gravity (9.4) and the highest atomic weight (232) of any element. Cerium is used to a small extent in medicine, and lanthanum and didymium closely resemble it.

The name "lanthanum" means "to lie concealed," and was given on account of the difficulty of its detection; and didymium closely resembles it, as the meaning ("twinned") of its name implies. Indium was discovered by the blue line which it gives in the spectroscope, and uranium is only used for the purpose of coloring glass and porcelain. Thallium is a metal resembling lead, and gives a green line in the spectroscope, by which it was first discovered. Titanium is related to tin, and is an undesirable constituent of certain iron ores. It also imparts a yellow color to glass and porcelain. Tungsten is a valuable addition to steel; and tungstate of soda applied to wood or clothing renders them uninflammable. Niobium and tantalum resemble each other very closely, but are of little importance. Molybdenum belongs to the iron group, which also includes nickel, cobalt and manganese. Vanadium is allied to antimony and nitrogen, and has been found to possess a remarkable oxidizing power. It is extensively used for the production of aniline black in dyeing and calico-printing establishments.

About one per cent of vanadate of ammonia added to an infusion of nutgalls makes a very superior black ink, which, however, will partially fade in time. We come last to the rare metals of the platinum group, of which iridium is the most useful, as, on account of its excessive hardness, it is used for the points of gold pens and stylographs, the knife-edges of balances, etc. Osmium is one of the most poisonous substances known; while palladium is remarkable for the readiness with which it combines with hydrogen, apparently forming an alloy, and indicating the metallic nature of that gas. It has lately been used as a substitute for steel in certain parts of watches, to avoid the effect of magnetism on the works. Ruthenium and rhodium are of no special interest. There are probably many other metals in existence which remain to be discovered. We are familiar with but a small portion of the crust of the earth, and know nothing of what there may be at a little distance below it. In the "periodic system" of the elements there are several gaps yet remaining to be filled, and elements possessing the required properties may some time be discovered. Whatever new elements may be found will undoubtedly occur in very small quantities; but at present there seems to be no limitation to the number of "rare metals" ready to indicate their presence in the spectroscope, beakers, or crucibles of the chemist who patiently searches for them.—*Popular Science News.*

STUDYING THE PHENOMENA OF CYCLONES.—The electrical character of cyclones and kindred phenomena has led the Signal Office of the War Department at Washington to issue a circular requesting information from parties in various localities, in answer to the following questions: "Were thunder and lightning observed, and if so, in what portion of the horizon, at what time of the day, and whether violent or otherwise? Was lightning or any manifestation of electricity seen in the funnel-shaped tornado cloud as it approached, or in the dark, heavy clouds surrounding it to the north and west? Note the deflection of a magnetic needle before and after the storm. Is there any reason to suppose that the clouds approaching from opposite directions preceding the first appearance of the funnel-shaped cloud were oppositely electrified? Note if the motion of the approaching cloud appears to be accelerated at the moment of, or immediately following, any electric discharge. What portion of the tornado cloud presents the lightest color? Did the upper portion of the cloud at any time present a glaring appearance like the colors of a brilliant sunset? Were 'balls of fire' observed to occupy the tornado cloud at any stage of its progressive movement? What effect had the storm upon small vegetation and the foliage of trees? In the event of death or injury to any person or animal, observe very carefully whether the effect resulted from the electrical discharge or the force of wind. Did you notice any peculiar odor in the atmosphere during the passage of the storm? Can the roaring, which always accompanies the tornado cloud in its passage over the country, be readily distinguished from ordinary thunder? Is thunder ever distinctly heard as emanating directly from the tornado cloud? How were the telegraph wires affected?"

RAPID VEGETATION ON VOLCANIC ROCK.—The rapidity with which volcanic rock becomes covered with vegetation is illustrated in the report of Dr. Treub, the director of the Botanical Garden at Buitenzyig, Java, on the reappearance of vegetation upon the Island of Krakatoa, which partly sank and was wholly overwhelmed by the ashes and pumicestone from its volcano during the violent outbreak of 1883 Three years after this date Dr. Treub (June 26, 1886) visited the island, and as he approached it, he found that it was covered with vegetation to the very summit of the mountain. The plants could not have grown from the roots or seeds of those existing before the great eruption, for the toughest organism must have been destroyed by the excessive volcanic heat. The whole island was covered with a layer of ashes and pumicestone from 3 to 24 feet thick. Nor could the vegetation, Dr. Treub thinks, have been introduced by man, for the island is uninhabited and difficult of access. It must have been by means of seeds carried thither by birds, by the wind, or by the currents of the sea, that the new vegetation arose. It consists for the most part of ferns, of which 11 different varieties were found, and of single specimens of blossoming herbs, such as are found on coral reefs, that have lately risen above the level of the sea. Dr. Treub has, however, found that the ferns were not the first living plants that had found nourishment on the destroyed island. Almost everywhere there were signs that the ashes and pumicestone had been covered by a thin layer of algæ, which rendered the surface of the soil soft and capable of absorbing water. These microscopic algæ prepared the way for the ferns, the latter, in their turn, for the blossoming herbs.

SPECTACLES FOR SPECIAL USE IN SURGERY.—Spectacles (to be used in surgical operations), lit by means of a small electric lamp, are a new invention. The lamp is arranged to send a beam of cool light on the part to be examined; meanwhile the rims of the spectacles exclude the outside light from the observer's eyes. The current is conveyed to the lamp by wires connected to the small terminals.

AN ASTEROID DISCOVERED.—The director of the Lick Observatory is notified by telegraph of the discovery of an asteroid at Nice, on January 28th. At 12 hours 48 minutes Greenwich time its position was R. A. 9 hours 40 minutes 11 seconds; and dec. north 11 degrees 46 minutes 36 seconds. Its motions were minus 44 seconds and north 10 minutes. Its magnitude was 13.

L. J. ROSE of Los Angeles has just imported 25 English skylarks. His agent had great trouble in filling the order. Mr. Rose has imported the birds to kill the scalebugs.

MECHANICAL PROGRESS.

Improved Foundry Practice.

From the attention that the subject is everywhere receiving, says Philadelphia *Iron*, it is safe to say that foundry practice within a few years will be raised to the dignity of one of the scientific arts, so marked and substantial have been the contributions to our knowledge of the chemical question involved therein. The latest of these relates to the use of ferro-silicon, and the advantages that may be derived therefrom.

Prof. Thomas Turner of Birmingham, England, lately reported the results of a series of tests, which exhibited the fact very clearly that silicon is a useful, rather than a damaging, element when present in cast iron in *proper quantities*, and that, by the use of ferro-silicon, pig irons and scrap, quite useless for foundry purposes, may be made to yield satisfactory results. Prof. Turner enunciates the doctrine now very generally accepted that "the tendency of combined carbon is to increase hardness and brittleness, while graphitic carbon makes iron soft, malleable and tough." He adds the further declaration that "too much of either form is a disadvantage; the strength depends on the proportion."

To be able so to regulate the proportion between combined and graphitic carbon as to produce a foundry mixture that will result in the production of the proper qualities, is the problem of foundry practice conducted on scientific principles; and Prof. Turner has shown in his able paper that "by a judicious use of silicon this proportioning can be accomplished exactly according to the wish of the founder, an increase of silicon changing combined carbon to graphitic, and vice versa. When the founder understands its use, he may soften and toughen, or harden and strengthen his iron to suit his requirements." It is important, however, that he should understand how to use this agent intelligently, or the resulting product will be weakened instead of being strengthened. This will happen, for example, if silicon be introduced into a metal in which the carbon is already graphitic, in which case "more silicon may weaken it and make it brittle."

It has been the practice for a number of years among foundrymen in the United States to use the high silicon irons made from the lean ores of Ohio and Kentucky as softeners to correct the hardness of the metal made from the refractory ores of Lake Superior and Northern New York and the South. The result has been satisfactory in practice, but it has only lately been definitely ascertained that the effect produced is due to the action of silicon. Now that the fact is known and accepted, the practice based upon it should be susceptible of being reduced to conditions of great certainty.

Messrs. W. T. Keep and Edward Orton, Jr., have made a valuable contribution to our knowledge of the action of silicon upon irons, in a paper on "Ferro-silicon, and the Economy of its Use," presented at the Buffalo meeting of the Institute of Mining Engineers. They set forth in this paper that during the past two years, as the process by which silicon affects the desirable results above described have become better understood, the demand for high silicon iron has increased. Foreign irons containing as much as 10 per cent of silicon were imported last year under the name of ferro-silicon; and, as a consequence of this demand, American makers are now producing ferro-silicon containing from 7 to 14 per cent of silicon, and in other respects of high quality.

These investigators have supplemented the scientific results obtained by Prof. Turner, by investigating the question whether the use of irons containing such a high percentage of silicon is as economical as when the percentage is lower. To this end, they present a comparison of the foreign and American ferro-silicons; they investigate and answer the inquiry whether the silicon in the pig is retained in the iron when remelted; and the further inquiry, whether the silicon in the pig is imparted to other irons during remelting, without loss of silicon.

Without entering into the details of these investigations, we shall only give the general conclusions arrived at, which are as follows:

1. Pig irons of any grade may be melted and cast without excessive loss in silicon or excessive change in chemical composition.

2. Ferro-silicons lose in remelting a little more silicon than do the softeners containing less silicon; but the difference is so small that commercial distinction is not possible.

3. In alloying silicon irons with scrap or pig iron deficient in silicon, the silicon is practically all retained in the mixture, and no economy in silicon results from the use of one class of American silicon iron over another.

4. American ferro-silicon, so far as we have investigated, is more economical than the imported, and probably, in most cases, softens to a greater extent.

The investigations of Messrs. Keep and Orton have demonstrated satisfactorily that it is entirely practicable and as cheap, if not cheaper, for the founder to produce the grade of casting he desires "by compounding suitable irons, than by purchasing irons in which the combination is already what he desires."

INCREASED APPLICATION OF STEEL FOR WATER AND OTHER PIPES.—Steel for the manufacture of pipes seems destined to come into extensive employment. Mr. Jas. Riley of the Steel Company of Scotland has been making efforts of a more or less tentative character to secure the adoption of the metal for this purpose, and to overcome the objections which have been raised to its use. The only technical difficulty was that of welding the tubes, and that he has overcome; but it is not so easy to fight down the prejudices against steel for tubes. Several home and substantial contracts for steel tubes have, however, been placed during the past year, and it is under contemplation in the west of Scotland to make provision for executing such contracts at a more rapid rate than is now possible. Estimates and tenders have been made within the past year or two for several very large quantities of these tubes, requiring from 100,000 to 150,000 tons of steel; but, as was the case on the introduction of steel for ship construction, the progress is very slow. When the strength of steel is contrasted with that of cast iron, of which those large water-mains are usually constructed, it will be at once apparent that a great reduction can be made in the thickness and consequent weight of the metal required for the purpose. For conveyance abroad, too, the question of freight is a consideration. As an indication of this, it may be mentioned that in a contract now in course of execution, the material for which is supplied by one of the steel concerns in Scotland, for 20 miles of water-main for Mexico, the sheets are not more than one-tenth of an inch in thickness. The fear of corrosion is not shared in by the engineers of this scheme. This main for Mexico is riveted—for such thin sheets cannot well be welded—and the connections are the same as those used in the Tay Bridge pipe.—*American Manufacturer.*

ELECTRICALLY DEPOSITED COPPER WIRE AND TUBES.—Steam pipes of copper are now, it is stated, made by electro deposition from sulphate of copper solution by the following process: The pipe is formed of an iron core in the depositing bath, and the deposited copper is pressed by a moving tool as it is deposited, so as to give a fibrous strength to the crystalline copper. After the pipe is thus formed it is subjected to hot steam, which expands the copper shell, or pipe, clear off the iron core, thus separating the two. These pipes have no joint, and are said to be very strong, tests showing that they break with strains of from 27 to 41 tons per square inch. It is further stated in foreign technical journals that Mr. Elmore, the inventor of this process, has more recently succeeded in adapting his system of tube-making to the manufacture of wire rods in the following manner: By an ingenious device the electrically deposited tube is cut, spirally, into a square wire rod, which rod is then drawn, in the usual manner, to the required gauge. By this means, the conductivity of the electro-deposited copper, which is one of its chief merits, on account of its absolute purity, is not deteriorated as in the case where copper is melted. This process, which has now been carried to a commercial success, is one of the most interesting of the many developments of applied electricity which has recently been made.

METALLIC MAGNESIUM.—Owing to its rarity, and its consequently high price, metallic magnesium almost ranked as a precious metal until lately, but it is now obtained by an improved process, and some German works are able to produce pure metallic magnesium at 25 frs. per kg. in its raw state and 50 to 65 frs. per kg. in the form of wire, bars or powder. According to recent experiments, this metal can support a tractile strain of 32 2 kg. per square millimeter, but before it can be worked it has always to be heated, like zinc; yet, at a temperature of 40 degrees centigrade, it can be rolled into sheets of only 1.0 of a millimeter in thickness. When in a compact mass this metal may be submitted to a high temperature without combustion taking place, but it is difficult to weld it, as the surface of the metal is never entirely free from a film of oxide. Magnesium has to be heated before it can be worked in the lathe, and when it has to be cast the molds have also to be heated. Its alloys seem to be of little practical value, as they are very brittle, and as regards electrotype precipitates, have only been obtained on magnesium with silver or copper. Magnesium in a powdered state has been employed successfully for obtaining instantaneous photographs, and a mixture of powdered magnesium with the nitrate or sulphite of carbon produces a highly explosive compound. Its principal use is, however, to produce a rapid and intense light.

NAIL MANUFACTURE.—A number of nail manufacturers belonging to the Western Cut Nail Association met in Wheeling on Tuesday, to consider the state of the nail trade and take measures to counteract the demoralization of prices. A dispatch says the result will probably be an association of the leading mills in the West, with a view of establishing a uniform rate for the product, and to put a check to the cut-throat business now practiced. A harmonious agreement was reached at the meeting. It provides for a guarantee fund as a pledge of good faith from each mill, and will go into operation at a very early day.—*American Manufacturer.*

ARE IRON CROSSTIES A FAILURE?—It is said that the iron crosstie with which the Pennsylvania Railroad Company has been experimenting on its tracks at Jersey City have proved failures and will be replaced with white oak ties.

GOOD HEALTH.

Investigations in Cigarette Smoking.

The *Medical News*, of a recent date, published a paper by Dr. Wm. L. Dudley, professor of chemistry in the Vanderbilt university, giving the results of recent careful analytical experiments made by him in his laboratory with the smoke of an ordinary cigarette. Mice were used upon which to employ his tests. It is not needful that we should give the professor's description of his modus operandi by means of air tubes, an aspirator, a glass jar, etc., the results of his experimentation being the chief object of interest in which the reader is concerned. Suffice it to say, then, that in each of his several chemical tests by the gradual combustion of a single cigarette, the mouse that was the recipient of the resultant smoke died in the course of the operation, being literally poisoned to death by inhaling the carbonic oxide evolved from the "noxious weed." The blood of the dead creature being subjected to spectroscopic examination, it was found that the veinous fluid had been so completely altered and vitiated that death was the inevitable effect. The tests were thoroughly scientific and conclusive. The fact was demonstrated, beyond the chance of doubt or question, that carbonic oxide is the chief constituent of cigarette smoke, if not all tobacco smoke, and that its inhalation into the air passage and lungs must of necessity be exceedingly deleterious, as much so to men and boys as to mice. Prof. Dudley refers to published assertions that the adulteration of tobacco with opium and flavoring drugs and the alleged presence of arsenic in the paper are the chief causes of the evil effects of cigarette smoking, but pronounces them "unsatisfactory and insufficient" as explanations. His chemical tests, he insists, have demonstrated positively the actual cause of the mischief, namely, the cigarette smoker's absorption of the carbonic oxide and other gases, "causing deoxidation of the blood, and thereby impairing its power to build up the wasting tissues of the body." The cigarette habit has of late years become very common in this country. It is one of those many European importations which do our people more harm than good. Many of our young men, and some who are neither young nor inexperienced, are literally burning out of themselves the best element of their manhood, by sucking into their systems] the poison of physical and mental degeneracy through the filthy cigarette. Cigar smoking and pipe smoking are bad enough and pernicious enough in all conscience, but cigarette smoking is absolutely suicidal.

The Yellow Fever Microbe.

A writer in the *Herald of Health* tells how the yellow fever microbes live, propagate, and act. We condense from that journal as follows: Dr. Clifton made the examination and report. The yellow fever microbe has much the appearance of two or three joints of sugar-cane. They have also been compared in appearance to a dumb-bell. They have been isolated and placed in a proper liquid for preservation and examination. The vessel which contains them is, of course, sealed up from the atmosphere. The seal of the vessel is quickly unsealed, a needle inserted, and a drop of the liquid dropped on a microscopic slide and quickly covered with the usual tiny film of glass. While in the liquid they were dormant, after being thus placed for about 45 minutes the microbes have fully aroused from their Rip Van Winkle sleep, and now you see what curious things they are. As I said before, they resemble three joints of sugar-cane, but the joints are not straight, but at opposite angles. Take this fellow, for instance, and you see a joint drops off, leaving him with two joints. Presently another joint joins on the dropped joint, and by this time a third joint appears on No. 1. Now look at No. 2 and there is a third joint. Now a joint drops from No. 1, and by the time it gains another joint No. 2 drops a joint, and this, with the joint from No. 2, join together, and there is microbe No. 3. Another joint grows on Nos. 1 and 2, and one drops from No. 3, and these, jointing together, make microbe No. 4, and so they go on until the little drop of gelatine is a working, seething mass of microbes. Now, these microbes are in the blood of a yellow fever patient, and there is where they live. They get in a blood corpuscle and eat out all the red part, as a darky eats out the red meat of a watermelon, and the blood is then a drop of clear fluid. To give you an idea of how many can crowd into a corpuscle of blood, let me say that it takes 3200 corpuscles to make an inch. Well, you can string just 150,000 microbes across the diameter of one corpuscle, consequently you can guess billions after billions of microbes in a drop of blood. The theory is that these microbes eat up one's blood so fast as to take it away from him in a very short time. Some men can stand the letting of more blood than others, consequently some men recover from yellow fever.

DIPHTHERIA CURE.—Dr. Deriker of St. Petersburg, who is the head physician of the Children's Hospital, and has treated no less than 2000 cases of diphtheria, and tried all remedies, both internal and external, has found the following a certain cure for the disease: As soon as the white spots appear on the tonsils he gives a laxative, usually senna tea. When the purgative effect has ceased, he gives cold drinks acidulated with lemons, limes or hydrochloric acid, and every two hours a gargle composed of lime-water and milk. Hot milk was also given as a drink, and the throat well rubbed with spirits of turpentine. The Academy of Medicine in France offered a large sum of money for a successful cure for diphtheria, and this is said to have been it. Equal parts of liquid tar and turpentine are put in an iron pan and burned in the patient's room. The dense resinous smoke gives immediate relief. The fibrinous matter soon becomes detached and is coughed up.—*Ex.*

TREATMENT FOR ASPHYXIATION.—A practical man, conversant with cases in which asphyxiation resulted from inhaling carbonic acid gas, gives some valuable hints for their recovery by simple remedies always at hand. Fresh air to restore consciousness is the first important step. Then he gave apples, apple juice, or vinegar, to neutralize the gas and remove it from the stomach by eructations. Eggs broken into vinegar, mixed and swallowed, made a very effective drink. After removing the gas from the stomach, the patient was further relieved by a cup of strong, hot coffee, which speedily restored him to normal vigor. On two similar occasions, where a physician was called, he administered injections of carbonate of ammonia, and the man was ill for eight or ten days from the effects of the medicine. A little common sense is often better than physic.

NITRO-GLYCERINE IN MEDICINE.—Nitro-glycerine bids fair, say the doctors, to become an important remedy for diseases of the kidneys, and experiments are now making in cases of Bright's disease. Nitro-glycerine of a pure quality, possessing all the explosive powers of the substance, is prepared in alcohol (which removes the explosive qualities) in the proportion of one part of the nitro-glycerine to 99 of alcohol, and is then prepared with sugar or milk in tablets. Thus prepared, it is called "trinitrin."

FUR BEARING ANIMALS OF SIBERIA.—An enormous number of animals are killed in Siberia yearly for their fur. At the last summer Fair of Irbit, which is a market for only a part of the furs exported from Siberia, no less than 3,180,000 skins of squirrels were offered for sale. Of other varieties there were 11,000 blue fox, 140,000 marmot, 30,000 polecat, 10,000 badger, 1,300,000 hare and 2000 fox.

A NOVEL CHAIR.—The Rev. Dr. William M. Taylor of New York has in his study a chair which he uses instead of riding horseback. It is moved by working two handles, and gives the rider, or the sitter, about the same motion as that of a galloping horse, only a little more violent. Dr. Taylor finds the exercise of this chair very beneficial after a long pull at his desk.

USEFUL INFORMATION.

Remarkable Qualities of the Hemp Plant.

The common hemp plant is said to posess some most remarkable properties in its effect upon the human system. Mohammedans, Hindoos, and others, whose religion forbids them the use of alcohol, find in the hemp plant a substitute which, though not so pleasant to the taste, produces an exhilarating effect on the system, which, in some respects, is more pleasant and equally desirable to one seeking for alcoholic stimulus, and yet far less injurious in its habitual use. It is taken in various ways. Mixed with tobacco, it is smoked in the hookah, and, to those unaccustomed to it, smells abominably. It is also taken in decoction, and in a solid form in sweetmeats. In ordinary doses it acts as a gentle and pleasant stimulant, exciting none of the brutal coarseness produced by alcoholic excess. In larger quantities, it appears to banish all sense of fear.

It is often taken by the East Indian sepoy before entering into battle, and Mohametan fanatics willingly brave death under its influence.

On account of this property the Afghans of Western Asia are reported to have made much use of it in their recent war with the English, and the success of many of the fierce onslaughts made by small parties of Afghans on the European soldiery, it is said, was attributable to the effects of the drink prepared from this plant.

When taken in excessive quantities it is said to produce a form of madness characterized by a reckless passion to destroy everything that comes in the maniac's way. It is related of an English officer at Delhi that, desiring to try the effect of hemp on himself, he took an overdose, inadvertently, and, bare-headed, on a scorching summer's day, rushed down the road armed with a large knife and fiercely attacked a large bullock, which was the first living thing which he encountered. He was quickly secured and disarmed, and, under the care of the doctor, who shaved his head and applied ice, was soon brought to his senses again.

HOW NATURE FORMS TRUE INK.—In Algeria there is a small stream which the chemistry of nature has converted into true ink. It is formed by the union of two rivulets, one of which is very strongly impregnated with iron, while the other, meandering through a peat marsh, imbibes gallic acid, another ingredient in the formation of ink. Letters and manuscript matters are satisfactorily written with this singular natural compound of iron and gallic acid.

Mixture for Writing on Glass.

The preparation for writing on glass called "diamond ink," says the *American Druggist*, is to be used with a common pen, and at once etches a rough surface on the parts of the glass it comes in contact with. It proves to be a very useful article for labeling bottles which are to contain liquids that will destroy common labels.

At the request of Professor Maisch an analysis was made, which proved it to be prepared ammonium fluoride, barium sulphate, and sulphuric acid. The barium sulphate seems to act as an absorbing medium, and when the semi-fluid mass is used, it makes a white mark, and prevents the spreading of the watery liquid; it also seems to make the acid etch a rougher surface.

It is made by mixing barium sulphate three parts, ammonium fluoride one part, and sulphuric acid a quantity sufficient for decomposing the ammonium fluoride and making the mixture of a semi-fluid consistency.

The sample examined was contained in a glass bottle holding nearly two fluid drachms, and which was thickly coated on the outside with asphaltum, on the inside with a thick stratum of beeswax, and was stoppered with a rubber stopper.

It is claimed by the manufacturer that the mixture contains no hydrofluoric acid and does not corrode a pen; but of course it does corrode a pen, and hydrofluoric acid is the one thing that does the etching. Any one making this mixture and wishing to keep it in a glass, may coat the bottle inside with paraffine, beeswax, or rubber. It should be prepared in a leaden dish, and is preferably kept in a gutta-percha or leaden bottle.

A NEW CEMENT.—London *Industries* describes a new cement which has recently been devised, and which is said to harden very quickly, and has been found to be of great strength. That journal says that this cement, by which many stone buildings in Paris have lately been renovated, is likely to prove useful also in repairing the foundations of machinery. The powder which forms the basis of the cement is composed of two parts oxide of zinc, two of crushed hard limestone, and one of pulverized grit, together with a certain proportion of ochre as a coloring agent. The liquid with which this powder is to be mixed consists of a saturated solution of six parts of zinc in commercial muriatic acid, to which is added one part of sal-ammoniac; this solution is diluted with two-thirds of its volume of water. A mixture of one pound of the powder to 2½ pints of the liquid forms a cement which hardens very quickly and is of great strength.

OUR WOOL IMPORTS.—For the ten months ending October 31, 1888, the value of the imports of manufactures of wool was 11 per cent more than for the same time last year. The increase was chiefly in women's and children's dress goods and miscellaneous merchandise. Though there was a slight falling off in the value of cloths, there was an increase in the quantity. There was an increase in the quantity of yarn of nearly 29 per cent. Clothing wools have been freely imported, and more of them have been retained for home consumption instead of being exported to Canada, etc. The export of wool is in some years a matter of considerable moment. In 1887 it amounted to 6,214,410 pounds clothing wool alone, over 3000 pounds of which were sent to Nova Scotia and neighboring provinces, 935,000 pounds to England, and 1,773,000 pounds to Belgium.

BRASS ALLOY.—A very good brass is made of 16 pounds of copper, 8 pounds of zinc, and one-half pound of lead. The lead should be added after the copper and zinc have been melted together. These proportions of the different metals make the best brass that can be made with zinc and copper. For very light castings the lead should be omitted, as it makes the alloy less fluid, but in heavy castings it makes them more solid and clean.

THE METRIC SYSTEM, in a single sentence: Measure all lengths in *meters*, all capacities in *liters*, all weights in *grams*, using decimal fractions only, and saying *deci* for tenth, *centi* for hundreds, *milli* for thousandths, *deka* for ten, *hekto* for hundred, *kilo* for thousand, and *myria* for ten thousand.

BOSTON'S DIVIDENDS.—Boston's monthly dividends are rapidly increasing. In the early portion of 1888 they amounted to $12 500,000 per month, $1,500,000 more than those distributed in Philadelphia. On an even distribution this would give every Bostonian $30 and every Philadelphian $11.

THE FINGER-RING COMPASS.—The old style of finger-rings with a setting containing a small compass is now being brought into use by electrical engineers. Held near a line wire, the movement of the compass shows at once whether a current is passing.

THE SOUTHERN NEGRO AND COTTON.—Cotton has long since ceased to be the product of the negro, as remarked by the New Orleans *Times-Democrat*. When the war ceased, nine-tenths of it was raised by the colored race; to-day, three-fifths come from white farms. The white States and white districts have become the cotton centers of the South. The negro parishes of Carroll, Tensas and Madison, the finest country in the world, where the yield is greatest and the staple the finest, produce far smaller crops than they bore 30 years ago, while the white counties of Texas have increased their production four and five fold. This fact attracted the particular attention of Prof. Hilgard, who prepared the census report on cotton, and he notes the singular coincidence that the bulk of the crop of Mississippi is raised in the hills, where the yield per acre is small, instead of in the bottoms, where every condition is favorable. The fact did not seem to strike him that the true reason lay in the fact that in the hills the cotton was raised by the whites; in the bottoms by the negroes.

YIELD OF TWO COMSTOCK MINES.—According to the Virginia City *Chronicle*, the largest single bullion shipment ever made from the Comstock lode was December 31, 1877. It included 133 bars from the Con. Virginia mine and 129 from the California. The aggregate weight was 32,818 pounds, valued at $1,099,099.71. The total combined yield of the Con. Virginia and California mines in 1887 was $32,658,869. The total bullion yield of the State in that year was $51,580,290. The total combined bullion yield of the Con. Virginia and California mines to July, 1878, was $100,011,285. At the close of the year 1878, the two mines paid out of this yield a total of $76,731,000 in dividends to shareholders. Since the consolidation of the two mines under the present title, the total sum disbursed in dividends was $2,440,800, footing up a total of nearly $80,000,000 paid in dividends out of that ground now known as the Con. California and Virginia.

BLACK HILLS ANTIMONY.—In the First National bank may be seen a huge specimen of the ore of antimony, taken from a mine near Pactola, in this county, and some 12 miles from Rapid City. The mine has never been developed, but enough work has been done to make it very probable that a large body of ore is located there. The specimen, upon assay, showed over 48 per cent of pure antimony, and $12 per ton in gold and silver. The mine has been located for years, but has never been developed; but the time is about here when this and many other minerals heretofore neglected will pay for working and shipment of the product.—*Deadwood Pioneer.*

THE DEBRIS COMMISSION.—A member of the U. S. Mining Debris Commission says: "It is the intention of the Commission, at the proper time, to make a personal examination of the entire field embraced within the scope of the investigation. This examination, however, will not be made until spring, due notice of which will be given to all parties interested. In the meantime we should be pleased to receive any papers, etc., which any one may desire to present."

A MINERAL PALACE.—Pueblo has decided to erect a Mineral Palace. The building will be about 300 feet long and 200 feet wide, constructed of heavy timbers entirely concealed outside and inside by minerals, especially iron, coal, copper, galena, coke and manufactures of iron and steel. Within the building it is hoped to have specimens from every silver and gold mine of any importance in the United States and Mexico.

DEMAND FOR IRON AND STEEL.—Three sources of demand are springing up, out of which iron and steel makers will profit during the present year. First, the locomotives; second, the demand for agricultural implements, mainly for distribution throughout the West; and third, the demand for machinery, engine and shop and mill equipments for steam-users throughout the United States.

GOLD IN JAPAN.—Mr. Sato of Sendai, Miyagiken, who is engaged in mining and has been at Hokkaido since about 1870, has discovered gold at Meekawamura, Shibata-gori, Miyagiken. Recently he came up to the capital with the mineral he had discovered, that it might be tried by a mineralogist. The gold is said to be of good quality.

ALASKA MINES.—The Indian who occasioned all of the hostility at the Yukon Portage last year when the miners were trying to get to the Upper Yukon placer mines gave himself up to the authorities at Sitka. He says his tribe will murder the first party of miners that go into the Yukon region this summer if he is hanged or confined in prison.

THE need of a geological survey in this Territory is imperative, and an appropriation by the General Government for the purpose would result in the advancement and development of our mineral resources, and in a few years' time place us on an equal footing with Colorado.—*Silver City (N. M.) Enterprise.*

GOLD has been discovered on City creek, ten miles from San Bernardino, the ore of which assays quite high per ton. One-eighth of one claim was sold for $5000. There is great excitement and crowds are going to the new mines.

Passing Events.

Two of the dynamos on the Sutro tunnel level are now giving power to the Nevada mill on the surface, and the electricians are sanguine that the whole plant will soon be at work. The power now obtained is a little less than half required to run the 40-stamp mill.

The electric railroad at San Jose has not proved a success, and the newspapers demand that it be removed and a road put in that will accommodate the people. Thus far the electricians appear to have been experimenting.

The daily ore yield of the Comstock mines is now 800 tons. If there were sufficient water to operate the river stamp-mills to their full capacity, the daily average ore yield of the lode would be above 1200 tons. The monthly bullion yield of the lode, with the present ore-crushing facilities, is above $500,000 monthly. Last year at this time it was above $750,000.

There is trouble with the boiler-makers at one of our local foundries over their refusal to put together boiler plates made in Scotland for the boiler of the steamer Australia, of this port. The men have gone on strike, though others have been put in their place.

Titles to Mineral Lands.

There ought to be some method by which the present system of obtaining patents to mineral lands should be simplified. Under present conditions, it looks as if the numerous surveyors, clerks and other officials were designed mainly to make life a burden to the man who applies for a quartz claim patent. Even with the efficient services of lawyers in Washington, and although the applications pass the scrutiny of the Surveyor-General's office and the local Land Office, and no contest by any other claimant is made, yet for three or four years, fine points of error will be discovered in Washington, each of which involves annoyances, expense and months of further delay. It is not so much the fault of the officials as the absurd intricacy of the laws they are trying to comply with.

And yet it is often urged that a poor man having a mine for sale should apply for a patent to perfect his title. The fact is, that by the existing laws a poor man is practically debarred from obtaining a patent to a quartz claim. However, if he be not adverse to perjuring himself, he may often manage, by filing a homestead, to secure a patent to about eight times as much mineral land, and this at a mere fraction of the trouble and expense incident to obtaining a quartz patent. But laws involving such possibilities are manifestly unjust and subversive of public morality.

Why the matter cannot be made as simple as in the case of homestead patents, it is difficult to see. It shows the remarkable vitality of the mining industry, that it has been able for so long to withstand the present system of obtaining title. Had the same been the case with homestead laws, such indignation would have been aroused all over the land that the objectionable laws would have been changed years ago. To the bad features of the system may in part be charged the tendency to take up mineral land as agricultural, since title can be more easily obtained in this way.

While Congress is tinkering with the mining laws, the best thing it can do is to immediately overhaul this subject of perfecting title to mineral lands, and so arrange the laws that a man can get his title in less than five or six years and without spending half what the mine is worth.

Petroleum in California.

The product of crude petroleum in California during the year 1888 is estimated at 300,000 barrels of 42 gallons each, this being a considerable increase on the product of any preceding year. Of the above quantity, the Pacific Coast Oil Co. extracted from their wells, located for the most part in the San Fernando district, Los Angeles county, about 50 per cent; the Mission Transfer Co. extracted from their wells in the Santa Paula district, Ventura county, about 40 per cent, the balance coming from the wells of the Puente Co., Los Angeles county.

The past has been a prosperous year with our large oil-producing companies who have had a ready market for their products at improved prices. Owing to the growth of our population, and the many new uses to which these earth oils are being put, their consumption, especially that of the crude article, is increasing at a very rapid rate, this increment having amounted during the past four years to 70 or 80 per cent.

The crude material is coming to be used largely for the manufacture of gas, also as a fuel, as well as for various other purposes. The San Francisco Gas Co. now consumes 100 barrels daily, and would double the quantity, enlarging and adapting their works to that end, could they be insured a steady and adequate supply. The Spring Valley Water Co., in their pumping works at Belmont, the Spreckels sugar refinery at Watsonville, the California wire factory, the extensive new pottery at Alameda, and many other large industrial establishments in this city and elsewhere, now make use of petroleum as a fuel.

In this country, and more especially in the southern part of the State, where so little fire is required, the gasoline stove is coming into common use, greatly increasing the demand for naphtha, the consumption of which has doubled annually for several years past. The Pacific Coast Oil Company manufacture now 35 per cent of the naphtha consumed on the coast, and will hereafter make a still larger proportion of this article.

Although no new refineries have been erected or new pipe lines laid down during the past year, many new wells have been bored, the above company making it a point to have three at least all the while in progress. While some of these wells prove failures, they continue, as a whole, to yield the average complement of oil common in this State.

The cost of plant for drilling these wells in California amounts to about $3000 each, this including engine, boiler, derrick, tools, etc. The cost of sinking per foot varies here over a wide margin, according to circumstances, the average being about $10, nearly three times as much as in Pennsylvania.

Tin.

Mr. E. N. Robinson, general superintendent of the San Jacinto Tin Co., reports that an English company has purchased the property and reorganized in London, England, under the name of San Jacinto Syndicate, Limited. The stock capital is $1,500,000. The syndicate bought all the property known as Rancho Sobriento de San Jacinto near Riverside, in San Bernardino county, California. Under the management of the new company the tin mines on the ranch will be thoroughly developed. In his report made in July, 1869, Mr. E. N. Robinson stated that there were 53 tin ledges on the Temescal range. Taking this as correct, then the San Jacinto Syndicate can, after developing the principal mines, supply the entire coast with all the tin consumed, for the supply of ore is said to be inexhaustible, while the quality of the tin turned out is of the very best.

The consumption of tin, both pig and plate, on this coast shows a remarkable growth. In 1878 the imports at this port were as follows: Pig, 625,080 pounds; tin plate, 95,277. Last year the imports were: 1,719,853 pounds in pig, and 32,203,125 pounds in plates. The increased requirements is due chiefly to the expansion of the canned-fruit industry and salmon industry, although the growth in population has also contributed somewhat to the increased consumption. Last year there was put up on this coast over 60,000,000 cans of our salmon, and over 45,000,000 2½-pound cans of fruit and vegetables. This year it is safe to affirm that an equal quantity, if not more, canned salmon will be packed, and a large increased quantity of fruits be canned, owing to the large growing and profitable trade for them east of the Rocky mountains.

Prices for both pig and plate ruled high throughout the year, that is, averaged higher than in 1887. Unlike 1887, 1888 closed weak at a lower range of values, while 1887 closed strong and higher, particularly for pig, which advanced from 24 in January, 1887, to 30 and 35 in December; 1888 just reversed the order—opening at 30 and 35 and closing at 23½ and 25.

BOX FOR QUICKSILVER AND AMALGAM.—George E. Mills of this city, while at the North Star gold-mill, Trinity county, recently, devised a new kind of sluice-box to catch and save the quicksilver and amalgam that had been running off over the copper plates from the battery. The device is placed at the end of the copper plates or blanket sluices. It has been working for three months past, during which time it has considerably added to the mine product, and has well satisfied the owners. It can be utilized in gravel as well as quartz mines, and the inventor says will save the finest gold and quicksilver. Mr. Mills is about to obtain a patent for his device.

THE SIERRA LUMBER CASE.—Notice of a motion for a new trial has been filed in the Sierra Lumber case. The grounds which will be urged are the misconduct of the jury, the excessive damages which, it is alleged, were given under the influence of passion and prejudice, and the insufficiency of the evidence to warrant the verdict.

THE Board of City Hall Commissioners have acceded to the demand of the Stone-Cutters' Union, and have ordered that all stone used in the construction of the plinth courses of the McAllister St. wings shall be dressed on the grounds instead of at the quarry.

A Belt of Steel Across the South American Continent.

This is an era of great undertakings by land and sea, says the Philadelphia *Record*. One of the latest is the railroad project to connect Recifa (Pernambuco), the most eastern seaport of Brazil, with Valparaiso, Chili, the nearest harbor on the west coast of South America to Australia and New Zealand. The voyage from Lisbon to Recifa is made by steamers in nine days, and Valparaiso could be reached by the proposed railroad route from Recifa in five days, making the time from Europe to the Pacific Coast 14 days. In obliquely cutting South America the road would traverse the fertile provinces of Brazil, Paraguay, the Argentine Republic and Chili. In both Brazil and the Argentine Republic use could be made of skeletons of railroads already constructed. The estimated cost of the undertaking is $150,000,000. A syndicate has been formed in Rio to obtain grants of land and money from the countries interested.

It need not be said that, on more grounds than one, this project, as well as all other projects for the development of South America, if accomplished, would be of great importance to the people of the United States. With the progress of that vast region in agriculture and commerce, its trade with this country would immensely increase if the American people should take advantage of their opportunities. But this is not to the United States the most important consideration involved in the development of Brazil and other countries of South America.

Some of our English cotemporaries think the project an impracticable one. A London paper says: "The fact is, it could not be built at all, and if built the territory traversed could supply no freight for it to carry, or passengers for it to convey; about 15 days' provisions would have to be carried on each train, and the natural obstacles are such that this short cut of 2500 miles would require perhaps a week more time than the water trip between its termini."

The experience of this country in building continental roads is quite opposed to the English objection. The building of such roads at this age of the world, as experience has fully shown, serves to open up a country and make business for itself. If railroads should penetrate these South American countries they would be sure to make their cheap and fertile lands available for remunerative cultivation, and thereby a large immigration would undoubtedly be attracted thither from Europe. There is already a mighty stream of immigration pouring into Paraguay, a portion of which would follow along the line of such a road as fast as it would be built and lay the foundation of new towns and provinces which would soon convert that now neglected and barbarous region into flourishing, civilized, agricultural communities. It would be but a repetition of our own experience in a precisely similar work. When a continental road was first proposed, the idea was scouted as chimerical and the Government had to step in and help it out at a cost of many millions. Since then and within the short period of less than 25 years, no less than three other continental roads have been built in competition and one or two others are in serious contemplation, if not actually in process of construction.

SULPHUR AND BORAX.—Mr. H. Jackson writes us from Bakersfield, Kern county, as follows: "It may interest you to know that fine crude oil, and almost pure sulphur and borax, has been found on the east side of this county in large quantities. A company is about being formed to work it all into marketable products. This is a good place, and the mountains contain more mineral wealth than I ever dreamed of, everything else having apparently been passed over in the rush for gold, and gold only."

LOCOMOTIVE WORKS IN CHILI.—An Englishman, who formerly resided in this city, has extensive works a few miles from Valparaiso, in Chili, from which there have been turned out lately half a dozen locomotives for the State railways at a cost of about $21,000 each in gold. The steel used is imported from England and the pig iron for castings from Scotland, while the wood-working machinery was made in the United States.

Artesian Wells.

In the PRESS of Jan. 26th was published an article on "The Requisite and Qualifying Conditions of Artesian Wells." There are other features connected with this interesting subject, not then mentioned, and which we shall now endeavor to place before our readers in a brief form.

Distribution of Wells.

In the employment of several wells their distribution is a matter of some consequence. The normal direction of flow, when it is once set up, by virtue of the opening of an avenue of discharge, is along a line drawn from the outcropping edge of the bed down its slope to the wells. Now, it is clear that if several wells are arranged along this line, the first one will be better placed than those which stand in its lee. These will be, indeed, measurably supplied by lateral flowage under the law of equal pressures, but less direct and freely. If the wells are disposed in a cluster, those on the exterior will partially cut off the supply of the interior wells. A more fortunate disposition than either of these would be an arrangement in a line at right angles to the direction of flow.

A still more advantageous arrangement, subject to local modification, would be to dispose the wells in a curved line, convex toward the collecting tract, for when the draft of the wells has made itself felt upon the sheet of water flowing most directly from the collecting belt to them, the higher pressure which the flanking portions still suffer will cause a lateral inflow, and the curved disposal of the wells will be more favorable for receiving the ingathering currents than a rectilinear arrangement, being more nearly normal to the resultant pressure and flowage.

In respect to the degree of separation of the wells, it is obvious that so far as the mere question of the greatest reception is concerned, the farther they are apart the better, for they will affect each other less; but, of course, practical considerations put a limit to their dispersion.

Figs. 1 and 2 exhibit tabular sections of strata, showing disadvantageous arrangement of wells. Figs. 3 and 4 are tabular sections, showing proper and advantageous arrangement of wells.

Control of Flow.

It is clear, upon consideration, that perfect control may be obtained by putting down a tube to the densest portion of the upper confining bed, if, by some device, the space surrounding it may be closed up so that no water can rise outside of the tube. Formerly this was done by a very simple and ingenious device known as the seed bag, shown in Fig. 5. A long, stout leather bag is made in the form of a cylinder, open at both ends, and just the size of the well-bore. This is slipped on the lower end of the pipe, and the bottom of the bag securely fastened about the tube by wrapping it with marline. A thimble just above the tie will aid in preventing slipping. It is then filled with dried flaxseed and the upper end likewise closed around the tube. When thus adjusted it is lowered into the well to the point determined upon, and supported there until the seeds swell by absorbing water. This enlarges the bag so as to fit the bore tightly and shut off all water from rising outside the pipe, and so all is compelled to ascend through the tube to the surface, or at least as high as the pressure is competent to force it.

Fig. 5 shows the seed-bag; *a* is the delivery tube leading to the surface of the well and terminating below the seed-bag; *c* is a leather bag filled with dry flaxseed; *b*, marline wrappings to secure the end of the seed-bag.

A better and more convenient, but more expensive, packing takes advantage of the expansion of the rubber disks when pressed together, instead of the swelling of flaxseed. A series of thick, washer-like rings of rubber are fitted about a section of pipe, so adjusted between iron disks that, after being put down, they can be screwed together, and so caused to expand laterally and completely fill the bore.

The construction of the parts and their adjustment are indicated in the accompanying figures (6 and 7), which illustrate one of the forms in use.

In Fig. 6 the rubber packing is shown apart: *a*, section of delivery tube extending to the surface; *b*, a large thimble into which *k* screws; *e*, an iron washer; *c*, a set of rubber disks fitting on *k* between *b* and *d*; *k*, a section of pipe on which is turned a long screw, fitting in the thimble *b*; *d*, a disk forming the head of the screw *k*; *h*, a section of pipe extending about two feet below the packing; *i*, a spring to press against the walls and hold the pipe *h*, while the section *a* and thimble *b* are screwed upon *k*.

Fig. 7 is the rubber packing shown screwed together as it is in the well.

In a form employed in the oil regions the expansion of the rubber disks, or single cylindrical one, is accomplished by pressing a conical hollow wedge between the pipe and the rings, thus forcing them out against the walls of the well.

In this case the packing is supported by a perforated tube, an "anchor," reaching the bottom of the well. As the packing in an artesian well is often located near the top, the necessity for support from below excludes this form in most cases.

Detection of Flow.

It has been remarked that the water may rise from the bottom to some higher portion of the well, and there find escape by passing off laterally through the upper strata. In absence of control the water does not always rise and overflow. It is a matter of some practical moment, therefore, to know when a stream is struck which may yield a flow at the surface when put under proper control. Such a stream usually discovers itself by a rise of water in the well, but this is not always the case. It is ordinarily desirable to test the capacity of any stratum which gives any suitable indication before sinking to a lower one.

Negative and False Tests.

1. It is possible, in perfect honesty, to make both a negative and false test. Suppose that two porous beds *A* and *B* (Fig. 8 showing a negative test), separated by an impervious layer, are traversed, and the testing of the first has been neglected, either because it failed to give encouraging indications or for other reasons. It is now desired to test these. Suppose the seed-bag or rubber packing be placed above the upper one. Now, if both bear a water level equally high, the test will be made, and the result will indicate their combined capacity; or if both heads are at least as high as the surface at the well, the test may be accepted. But suppose that the bed *A* has been cut into by erosion, or been reached by crevices, or is otherwise defective, while the other, *B*, remains intact and bears an elevated fountain-head. Under these conditions the water may flow from *B* through the bore into *A*, and escape laterally through it, as illustrated in the figure. Now, in this case the result may be simply negative or positively false and misleading. If the lateral leakage through the stratum *A* effectually disposed of the flow from *B*, and there was no leakage in the upper portion of the well, the water in the test tube would stand during the test at essentially the same hight as before, and the result would be negative, failing to indicate a possibility that really existed. If, on the other hand, there was lateral leakage through the upper strata as well as through *A*, neither alone being quite competent to dispose of the flow from *B*, then the introduction of the test pipe would cut off the upper leakage, leaving the bed *A* unable to dispose of the entire flow. In this case there would be a rise of water in the tube, and, possibly, a flow. The mischievousness of a test of this sort lies in the fact that it appears to be a true test, because it shows some result, while in reality it is false and misleading. The true test in this case can only be made by placing the packing between the porous beds *A* and *B*.

2. Take another instance where two porous beds, as *A* and *B* (Fig. 9—a partial and misleading test), have been traversed. Let the packing be placed between these. Then (1), if *A* equals *B* in productive capacity, water will stand at the same hight within and without the test-pipe *if there is no leakage in the upper beds*. (2) If the failure to flow was due to such leakage, then a flow will result from *B*, but the additional flow which might be secured from *A* is lost (see figure). (3) If *A* has a greater head than *B*, and if there is no loss above, the water in the test-pipe will actually be lower than that outside, as illustrated in Fig. 10. This may be said to be an *inverted test*, and is less misleading than the false and negative tests, since it plainly indicates an error of manipulation. (4) If, however, there is in this case considerable lateral waste in the upper strata, the valuable flow from *A* will be lost, just as before the test was made, while *B* may give a rise in the tube, or even a flow, which would foster the impression that a fair test had been made, while in reality the greater flow had been lost. (5) If *A* gives a feebler flow than *B*, but has an equal head, and is a possible means of escape for the flowage from *B*, then the packing has been placed at the right point and the test gives the best results.

Take another instance, as in Fig. 11. This is a section of strata and three wells, showing one correct and two erroneous tests. These wells are assumed to be independent of each other, and are placed together on the diagram merely for convenience. In this cut let *A* and *B* represent porous beds (Fig. 11), the lower of which is so conditioned as to drain the upper one by virtue of a lower outcrop. (1) First, if the drainage loss below is not complete, and if the packing is placed above *A*, as shown in Fig. 11, *I*, the result will be negative, if there is no leakage in the upper strata. (2) Should there be considerable loss there, it will be cut off by the tube and packing, and some rise in the tube will be the result in most cases. In either instance the result is misleading, particularly in the last, because the small rise of the water is apt to allay any suspicion as to the effectiveness of the test. The real fact, however, remains that the flow from the productive strata is mainly lost below. (3) Suppose that the packing is located between *A* and *B*, as in Fig. 11, *II*, it will then shut off the flow from *A*, while that in *B*, because of a larger outlet, will fail to flow. Now, if there is opportunity for lateral leakage in the upper strata, the water from *A* will rise in the well *outside* of the test-pipe and pass off into these open upper beds. (4) But if no such opportunity is afforded, it may rise to the surface and overflow outside of the test-pipe, while the water within the test-pipe will probably be found to be lower than before the test was made.

The proper method of testing wells known or suspected to present these conditions is to sink a simple bag of seed or other obstruction to a point in the impervious stratum between *A* and *B*, which, when it tightens in its place, will shut off all leakage in the upper strata, and the full capacity of the water-bed *A* will be tested.

FIG. 8. Negative Test.

FIG. 9.—Partial and Misleading Test.

FIG. 10.—An Inverted Test.

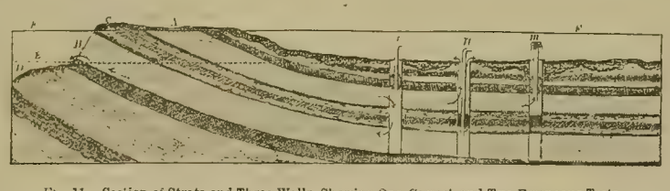

FIG. 11.—Section of Strata and Three Wells, Showing One Correct and Two Erroneous Tests.

Los Burros Mines, Monterey County.

A rich strike of gold-bearing quartz has been made in the Last Chance mine, Los Burros Mining District. This new mining camp is comparatively unknown in San Francisco, but it promises to become one of the richest mineral-producing districts in the State. Although the first discovery was made only a year and a half since, much development work has been done. It is situated in the southeastern part of Monterey county, on the western slope of the Coast Range of mountains, and about five miles from the ocean. The country is well watered and timber is abundant, especially redwood and pine. The course of the mineral belt extends from S. E. to N. W., and has been prospected from the ocean beach southeast for a distance of 15 miles, and how much farther it extends is as yet unknown.

The first discovery was made by Mr. W. D. Cruikshank. A shaft was sunk about 50 feet. The ore in this vein is remarkably rich and has an average width of about three feet (shows free gold all through the vein). About three months after the first discovery another lead was found about 75 feet northwest, which is as rich, if not richer, than the first. A tunnel was run on the lead for 150 feet, and from a small vein at the beginning it opened out to six feet. The quality of the ore is high grade, and few mines are found where it averages so well both for quality and quantity.

In March last a tunnel was begun to crosscut the ledge. Much hard rock was encountered, but finally the first ledge was cut at a distance of about 350 feet. The result exceeded the highest expectations of the proprietors. Drifting on the vein each way, it opened out to seven feet of solid ore and of high grade; the average width for 75 feet as far as prospected is six feet. The walls are clearly defined and are of talcose slate. Assays of this ore show $2000 rock. It carries a small percentage of silver. The tunnel is being continued on to cut the upper lead. This is of the greatest importance, as the last discovery is at a depth of 150 feet below the surface and clearly demonstrates the fact that we have mines in the Coast Range of California which are of greater value than has been supposed.

Many other discoveries of importance have been made. The Manchester shows rich rock, and although little development work has been done, the owners intend to prosecute work vigorously in the spring. The Pacific adjoins the Last Chance mine on the northeast, and is owned by a company of capitalists. Their intention is at present to run a long tunnel and tap their vein deep. The ore on the surface is good, and assays show as high as $1130 per ton. Prominent among the mines of camp is the Ajax, which lies about a mile to the southeast of the Last Chance. A tunnel has been run on this claim 240 feet.

The ledge was cut at a depth of 100 feet from the surface. The ore is remarkably fine and free gold is plentifully distributed throughout the vein. The latest strike in the camp is known as the Wild Bill, and is owned by Wm. Covington and M. J. Gilleran. It lies to the south of the Ajax, and runs parallel with it.

This strike has caused great excitement and miners and prospectors are flocking in to see it. The vein is uncovered for a distance of 100 feet, and is strong and permanent. The ore is decomposed quartz, and working tests show between $80 and $90 per ton. The owners are pushing the work rapidly on this claim, and are confident they have a mine that can soon be placed on a paying basis. There are a number of other claims on Alder and Willow creeks which deserve mention; one recently discovered, known as the Pop Sure, the property of Mr. J. E. Davis and Gus Peterson, which promises well. The Brewery claim is very rich. The lead is in solid slate formation and this is sprinkled with gold. Space forbids extended mention of the numerous rich prospects of this rising young camp. Enough has been shown, however, to overthrow the theories of so-called mining experts who have repeatedly made the statement that there are no mines in the Coast Range.

The miners there are confident, and not without reason, that they have a mining camp, for its age, second to none in the State.

Pig Iron on the Pacific Coast.

The Puget Sound Iron Co. at Irondale, Puget Sound, W. T., after an eight-months' closing down for general repairs, went into blast in last September, with a monthly output of 1000 tons of pig iron. The Oregon Iron & Steel Works at Oswego, Oregon, after remaining closed down for a series of years, went into blast about November 1st, with a monthly output of 1000 tons of pig iron, The latter works are reported to have put in new and improved machinery so as to operate to the best possible advantage. The Clipper Gap Iron Works in this State are out of blast. A large iron ore deposit is being developed in the southern part of this State, and another on Puget Sound. The company developing the latter, it is said, has contracted the output to a rolling-mill that is being built on the Sound. The ore used by the Puget Sound Iron Works comes from the Texada islands, and is said to turn out a superior quality of pig iron, the price for which is quoted in this market at $30 a ton. Since going into blast the company has sold to the Southern Pacific railroad 700 tons for making car-wheels. The Union Iron Works take about 100 tons a month, while other large iron works in this city take from 25 to 100 tons a month. The fine steam cylinders in use on the steam schooners are manufactured from this iron. The Oregon Iron & Steel Works have their output under contract to the iron works at Portland, Oregon, chiefly for the making of iron pipes.

The high market in this city for pig iron has no doubt had a stimulating effect on the production of pig iron on this coast. The high market is due to an advance abroad, and also to an advance in freights. The consumption on the Pacific Coast has increased at a rapid rate, due to more expensive structural improvements, railroad building, and also iron shipbuilding. The latter is in its infancy, but promises to assume large proportions in the near future. It is generally claimed among iron men that more mill machinery will be turned out this year than in any one year for five years past. If this shall prove correct, the demand for pig iron for this particular purpose will be quite large.

The high price of English coals in the primary markets and the high rates of freights cause a strong market for English coals, with no immediate prospect of a reduction in values. The same influences, or rather the high freights from England to this port, cause coke to rule high for prompt shipment, while the small supply here causes a strong and high market for spot. On this coast there are three coking establishments, two in Washington Territory and one in this State. That in this State is not running, but the two in Washington Territory are working. They are as follows: New Tacoma Co. of 30 ovens and a capacity of 90 tons a week, and the Wilkeson Co. of 50 ovens and a capacity of 150 tons a week. The coke is said to resemble that of Connelsville, Pennsylvania.

Legislative.

A bill of general interest which has passed both houses is Assembly Bill 118, entitled "An Act to provide for the proper sanitary condition of factories and workshops and the preservation of the health of the employes." Section 3 will be of importance to bakers and those engaged in basements.

Section 1 provides for the construction of outhouses used by employes.

SEC. 2. Every factory or workshop in which five or more persons are employed shall be so ventilated while work is carried on therein, that the air shall not become so exhausted as to be injurious to the health [of] the persons employed therein, and shall also be so ventilated as to render harmless, as far as practicable, all the gases, vapors, dust or other impurities generated in the course of the manufacturing process or handicraft carried on therein that may be injurious to health.

SEC. 3. No basement, cellar, underground department or other place which the [Commissioner] of the Bureau of Labor Statistics shall condemn as unhealthy and unsuitable shall be used as a workshop, factory or place of business in which any person or persons shall be employed.

SEC. 4. If in any factory or workshop any process or work is carried on by which dust, filaments or injurious gases are generated or produced that are liable to be inhaled by the persons employed therein, and it appears to the [Commissioner] of the Bureau of Labor Statistics that such inhalation could to a great extent be prevented by the use of some mechanical contrivance, he shall direct that such contrivance shall be provided, and within a reasonable time it shall be so provided and used.

SEC. 5. Every person, firm, or corporation employing females in any manufacturing, mechanical or mercantile establishments shall provide suitable seats for the use of the females so employed, and shall permit the use of such seats by them when they are not necessarily engaged in the active duties for which they are employed.

SEC. 6. Any person or corporation violating any of the provisions of this Act shall be punished by a fine of not less than $50 nor more than $100 for each offense.

SEC. 7. It shall be the duty of the [Commissioner] of the Bureau of Labor Statistics to enforce the provisions of this Act.

A bill has been introduced by Petrie making an appropriation for the care of the State Mineral Cabinet.

Hart's bill has been passed, making an appropriation for the purchase of an electric plant, pump and pipe necessary for utilizing the waters of American river for power purposes for the Folsom State Prison.

Campbell has submitted a bill fixing eight hours as a legal day's work on public buildings, and allowing extra compensation for overtime and holidays.

The Assembly Committee on Mining and Mining Interests presented two reports on the bill to appropriate $150,000 for the State Mining Bureau. The majority report, which is signed by Sims, Davis, Gardner and Coleman, recommends that the appropriation be made. The minority report, signed by La Grave, Mahler and Tulloch, gives certain reasons for opposing the amount named, and says: "We cannot recommend the bill in its entirety, and as a substitute for the amount named in the bill and its proposed disposal, we respectfully suggest that the appropriation be $70,000, and that $50,000 of that amount be used for geological surveys of the principal mining lodes of the State."

Coast Industrial Notes.

A GOOD many Eastern boilermakers have come to this city of late.

THE real estate agents of San Francisco are about to form an exchange.

A DOZEN new oil-wells have lately been bored in Los Angeles county.

THE water-pipe manufacturing industry of this city has been brisk of late.

ORDERS for three new electrical-power plants have lately been received by a local firm.

A FACTORY for the manufacture of wire cloth and wire nails is soon to be established at San Diego.

GLOVEMAKERS here have had one of the busiest seasons in their experience, the local trade being unusually good.

THE Southern Pacific Company is doing a great deal of bituminous rock work at various points along its line.

BEDS of good clay for making terra-cotta work have been found on the shore of Carquinez straits near Vallejo.

J. M. DENNETT of Dakota thinks of putting up a mill in Redding for the grinding of barley, the manufacture of flour, cornmeal, etc.

A COMPANY has been organized at San Luis Obispo to develop the coal mines at the head of San Jose valley, about 22 miles from Santa Margarita.

EX GOVERNOR PERKINS states that business is rather dull for steamers on the coast at present; in fact there are more steamers than there is work for.

A FLOWING oil well, 110 feet deep, has been struck on the Sunset Co.'s land, Kern county, about 25 miles from Bakersfield. The flow is about five barrels a day.

OAKLAND people are trying to get some one to put up a cannery there to take the place of the Lusk cannery, which went down with the fortunes of W. T. Coleman & Co.

THE Ben Lomond Land and Lumber Co. is a new Santa Clara county company. The names of the incorporators are J. B. Pierce, R. T. Pierce, H. M. Leonard, Wm. Cary and J. H. Pierce.

THE Portland *Oregonian* says: The Willamette Falls will furnish 200,000 horse-power for nine months of the year, while those at Minneapolis only furnish 120,000 horse-power for six months.

A PIANO, the framework of which, outside of the inner iron-string frame, will be entirely of California redwood, is now being made at a large local factory for exhibition in the California display in London.

WRIGHT & Co. launched recently at Fairhaven, Humboldt bay, the schooner Henry C. Wright, built at a cost of $20,000, and with special regard to the requirements of the trade with Mexico and Central America.

A DREDGER of the Bowers patent has been built in San Diego. A 250-horse power Westinghouse engine drives the pump. The first work of the Bowers dredger will probably be done in Glorietta bay, at Coronado.

NEW terra-cotta and pressed-brick works are to be established by local capitalists. These gentlemen have been looking about for a suitable location for their works on the shores of the bay, and have about decided on Vallejo.

IT is stated at Seattle that a railroad is to be at once built from Ship Harbor, on Fidalgo Island, northeastward for 30 miles along the Skegit river to tap the coal-fields, and that the Ship Harbor will be the headquarters of the down-sound shipping.

THE coast line of the Southern Pacific Company having been finished to Santa Margarita, some of the men who have been engaged in construction work will now proceed with the building of a depot, warehouse and other structures at that place.

A BILL introduced in Congress provides that no raft of timber or logs shall be brought into or taken out of any harbor or port of the United States, or brought into or upon any of the great lakes from any river, stream, port or place in Canada or any other foreign port.

THE Pacific Iron and Nail Works has begun the manufacture of wire and of wire nails. But one other concern on the coast—the California Wire Works, in San Francisco—makes the former product, and the Oakland establishment is the only producer on the coast of wire nails. The old glass works, at the foot of Filbert street, has been utilized for the new industry.

THE Los Gatos Packing Co. has incorporated. The capital stock is $100,000, divided into 2000 shares. The amount of capital stock already subscribed is $2500, which is taken by Samuel Templeton, Robt Walker, Michael Miller, Jas. E. Gordon and John W. Lyndon. The principal place of business is Los Gatos, which is the residence of all the directors.

THE contract for supplying 30 tons of flanged boiler plates for the Monadnock has been awarded to the Union Iron Works of San Francisco for $10,870. This is an assurance that work will soon begin in earnest on the Monadnock and at the Mare Island yard.

THE Riverside *Press* says: In southeastern Los Angeles county, in what is known as "Gospel Swamp," there is a tract of land of several thousand acres composed of decomposed vegetable matter, which is known as peat-land. This peat has been examined by a number of people and is believed to contain valuable fertilizing matter.

THE Santa Barbara *Press* says: A new oil steamer called the W. L. Hardison has been built for the Mission Transfer Company, and will run from Hueneme to this and other southern ports in the oil trade. She has a capacity of 38,000 barrels, and can deliver at the rate of 40,000 gallons an hour.

IN speaking with S. T. Gage of the Southern Pacific Company it was elicited that the Pacific Division of that corporation consumes 60,000 tons of coal a month. It would require 30 colliers to bring into port that amount of coal. By the Pacific Division is meant the lines from Oakland to El Paso, Ogden and Portland.

HARBOR WORK.—Contractors for the work of the improvement of the Humboldt bar are rushing the work of building the necessary cars, scows, wharves and sprons, and constructing a railroad to the quarry. A large number of men are at work. The transportation of materials to the scene of the improvements will commence in March.

THE Piedmont Cable Railroad Company made a contract with the Judson Iron Works a short time ago for the manufacture of a large quantity of rails to be laid on the new road. This contract has now been vacated, and the reason for it is, that it was discovered that the rails ordered infringed upon a patent. It will be necessary to send East for rails.

THE Colusa *Sun* says: Father Wallrath's brick kiln, burned for the purpose of erecting a convent, is almost entirely a failure. He first employed Warren Smith to burn the kiln, and when he could not do it he sent to Woodland for Mr. Kraft, one of the most experienced burners in the State. Some 40 or 50 cords of wood extra were also consumed. It is hard to understand why it was a failure.

THE Southern Pacific has just expended about $1,000 000 on an air brake equipment. Upward of 15,000 freight cars, running on both the Pacific and Atlantic systems of the company, have been equipped at a cost of $50 a car, or about $750,000. Over 500 passenger, mail and express cars have been equipped at the rate of $100 a car, or $50,000, and the equipment of 600 locomotives at $350 each, cost $210,000.

LUMBER IN TULARE COUNTY.—The books of the San Joaquin Lumber Company show that there was more lumber sold in Visalia during the past year than in any other town south of Stockton, in this valley, excepting Fresno. There are now about 400,000 feet in the yard. The company has purchased the "cut" of Comstock's mill for the coming season, the lumber to be delivered as desired at different points in Tulare county.

NEW CHOCOLATE MILLS.—A local company, which has had great success in the manufacture of chocolates and spices, will soon remove from its old works to newer and larger quarters. The new works will be provided with all the latest-improved machinery and will have a largely increased capacity. The chocolate and spice business of the city has grown wonderfully of late, and will soon form an industry to stand in the front rank of our local trades.

LUMBER COMPANY AT SUTTER CITY.—The Sutter City Lumber and Milling Co. has been incorporated with a capital stock of $50,000. The directors and officers are: W. F. Hoke, president; Wm. Ellington, secretary; H. H. Brittan, manager; J. C. DeWitt, Thos. Fox, Conrad Kloss, G. W. DeWitt, P. D. Gardemeyer and H. Best. The Farmers' Union bank is treasurer. H. H. Brittan will shortly secure stock and machinery. The sheds and buildings will be put up at once.

STATE PRODUCT IN 1888.—Statistics gathered by the San Francisco Board of Trade show the State's productions for the year to aggregate $92,940,138. The detailed value of these productions is as follows: Hops, $1,038,000; canned fruits and vegetables, $4,444,100; raisins, $1,601,250; prunes, $315,000; dried fruits, $1,950,000; nuts, $225,600; oranges, $1,210,000; dairy products—butter, cheese, and milk, $6,158,480; wine and brandy, $4,200,000; quicksilver, $1,350,000; honey and beeswax, $250,000; beans, $450,000; potatoes, $700,000; salmon, $250,000. The cereal crop, owing to the extremely hot weather, showed a shortage of 50 per cent in the crop. The products are as follows: Wheat, $24,000,000; barley, $6,000,000; rye, $50,000; oats, $1,100,000; corn, $3,000,000. Lumber—Ties and pine lumber, redwood stakes and shingles, $11,366,476. Cars of green fruit exported East, $2,000,000; green fruits, exclusive of canning, shipped East, $2,000,000. Gold and silver shipped, $12,000,000. Valuation of wool during the year, $4,917,763; hay crop, $2,000,000.

LOGGING AT TRUCKEE.—All the latter part of January was very favorable for logging around Truckee, and most of the mill-owners have taken advantage of the snow and cold weather to get to their mills a good lot of logs for summer use. George Schaffer has three six-horse teams and one eight-horse team going constantly, and in two weeks has put in the mill pond about 500,000 feet of logs. This is exceptional good work for winter. Logging is also being conducted at Ellen's mill, at Boca and at Camp 18. This will enable the mills to start up early in the spring, and the outlook for a prosperous and busy season is very bright.

ELEVATOR SYSTEM.—E. C. Michener, agent of Peavy & Co. of Minneapolis, has completed all arrangements for constructing a system of grain elevators in connection with the lines of the Oregon Railway and Navigation Company. A terminal elevator will be located at the lower end of the city, where river frontage has been secured for it, and also for storage buildings of 3,000,000 bushels capacity. This terminal elevator, which will be the first on the Pacific Coast, will have a capacity of unloading 300 cars in 20 hours. Its elevating capacity will be 50,000 bushels per hour and its facilities for sacking 50,000 per day. All wheat will be sacked for export at present.

ICE HARVEST.—The Truckee *Republican* of Jan. 26th says: The ice harvest is nearly completed. We are informed that work is concluded at Prosser creek, Martis creek, Boca, at the People's Co.'s works and at Floriston. The Tahoe Company will finish by Monday, and also the Rocky Run. The Essex has been putting in ice since Monday and the Mountain Ice Company commenced yesterday on its second crop. The crop is of fine quality and nearly double in quantity that of last year. The ice companies have had very favorable weather and the cost of putting up the ice has been less than usual. In fact it is a cheap crop and the companies ought to make money next year.

THE SALMON FISHERIES.—The salmon fisheries of Alaska are developing in a wonderful manner and that region is now regarded by the canners as the one from which supplies for the world's consumption must now be looked for. There have been organized since last season no less than 20 new companies. The salmon catch last year, as stated by one who is extensively interested in the business, amounted to 500,000 cases of two dozen cans containing one pound each, and was valued at over $2,500,000. This year, if all the canneries meet with measurable success, the catch will be double that of one year ago both in quantity and value. The Alaska canneries propose to become independent of occasional steamers for their supplies, and several of them have ordered of our shipbuilders small steamers. These steamers are built expressly for this traffic. They are to be fitted with bulkheads in the hold for containing the fish. The canneries being conveniently and centrally located, these steamers will steam to where the fishermen are operating and gather up the catch as it accumulates.

HALIBUT FISHING.—U. S. Fish Commissioner Abbot says: "The White of this city has been chartered by Louch & Johnson of Seattle for the halibut business of that place. The White has just sailed for the north. A halibut company has been organized at Seattle, and the men in it are now picking up suitable vessels for the business. The White is about an 80-ton vessel. Mr. Johnson of the company was here last week for more vessels. Another company for catching halibut has just been organized at Portland. The Henry Dennis sailed from Gloucester, Mass., a month ago, and is now coming around the Horn, preparatory to engaging in the halibut trade off the Washington Territory Coast. Other vessels, I do not doubt, will join her, as the Atlantic fisheries are fast playing out, and Eastern fishermen must henceforth operate largely here. I see by the Cape Ann *Advertiser* that halibut from the Grand banks are selling in cargo lots for from 13 to 18 cents per pound.

COTTON AND WOOL.

The Cotton States.

Thirteen cotton States in the Union in 1887-8, raised 456,090 bales, against 401,452 bales the previous season. Georgia led off with 133,877 bales; South Carolina, 111,003, while Texas, the largest State, produced only 544 bales. In 1886-7 she raised only 180 bales. Says the New Orleans *Times-Democrat*. In the Carolinas and Georgia, from one-fourth to one-fifth the cotton now raised is manufactured in the home mills. The industry is gradually extending from that section to the Southwest, where the bulk of the crop is now produced. The Alabama, Mississippi and Louisiana mills are increasing their output, and in the next half-dozen years must reach the status of the Georgia factories. Another cycle will carry the industry west of the Mississippi to Texas and Arkansas. The Southern Atlantic States, with a production of about 1,750,000 bales, consumed last season 344,042, or one-fifth their production, in their own mills. This is certainly a good showing for an industry originating almost wholly since the war, and indeed mainly during the last ten years.

It will be seen from the following that the cotton-growing States are also fast coming to the front as cotton manufacturing States, as well as are other manufacturing industries. The value of the cotton goods made in the South was $21,000,000 in 1880, and nearly $50,000,000 for 1888.

In 1880 there were 40 cotton-seed oil mills in the South. Now there are 160, with about $12,000,000 invested.

The value of the South's agricultural products for 1888 was about $800,000,000, against $571,000,000 in 1879.

The value of the South's live-stock is now $570,000,000, while in 1879 it was $391,400,000.

The production of grain rose from 431,074,630 bushels in 1880 to 626,305,000 bushels in 1887, an increase of nearly 200,000,000 bushels.

COTTON PRODUCTION IN CHINA.—The cotton production of China has always been a mysterious quantity, and early estimates of it, as well as that of India, made it of enormous proportions. Though even now there are no reliable statistics regarding the cotton yield of this empire, yet it has been pretty well ascertained that instead of being large the production is comparatively small and the quality inferior, like all native Asiatic cotton. For the year 1883 Mr. Ellison gave an estimate of 1,425,000 bales, as the annual yield of cotton in China, and his method of arriving at this was as follows, presuming upon a population of 330,000,000, using an average of 2½ pounds of cloth to each person:

	Pounds.
Total consumption of cotton fabrics	750,000,000
Goods and yarns imported	140,000,000
Raw cotton imported	40,000,000 = 180,000,000
Balance	570,000,000
Equal in bales of 400 pounds each	1,425,000

To this there should be added about 25,000 bales exported to foreign countries from the provinces of Kiangsu and Chekiang and others in the valley of the Yangtse-Kiang river. A limited export is made in native junks, of which no account is taken at the customs ports. If the annual production was taken at 1,500,000 bales, we should say that it would not be far out of the way. Cotton cultivation is almost entirely an internal industry, and only in the provinces referred to above is there a supply grown exceeding local wants.

COTTON CULTURE IN AUSTRALIA.—According to late information, efforts are being made at Queensland to develop the growth and manufacture of cotton, and a deputation of farmers recently waited on the Premier to request that a bonus of 5000*l.* be offered for the first 5000 yards of cotton goods manufactured in the colony from cotton grown there; also a grant of 5000 acres of land at the expiration of three years from the establishment of the first cotton factory. Sir Thomas M'Ilwraith received the proposal favorably, and promised to consult his colleagues upon it. Formerly, when cotton was grown in Queensland, 2,000,000 pounds were exported in one year, and it is contested that if farmers be encouraged to grow it, a great deal of land fit for no other purpose will be brought into cultivation. It is, however, admitted that there is no reason to expect success in growing cotton for exportation, and the object is to get factories established to consume the produce, relying on the ordinary import duty for protection.

THE SOUTHERN NEGRO AND COTTON.—Cotton has long since ceased to be the product of the negro, as remarked by the New Orleans *Times-Democrat*. When the war ceased, nine-tenths of it was raised by the colored race; to-day, three-fifths come from white farms. The white States and white districts have become the cotton centers of the South. The negro parishes of Carroll, Tensas and Madison, the finest country in the world, where the yield is greatest and the staple the finest, produce far smaller crops than they bore 30 years ago, while the white counties of Texas have increased their production four and five fold. This fact attracted the particular attention of Prof. Hilgard, who prepared the census report on cotton, and he notes the singular coincidence that the bulk of the crop of Mississippi is raised in the hills, where the yield per acre is small, instead of in the bottoms, where every condition is favorable. The fact did not seem to strike him that the true reason lay in the fact that in the hills the cotton was raised by the whites; in the bottoms by the negroes.

The Wool-Growers.

The wool-growers of Texas have recently been in council and have adopted resolutions urging Congress to so amend the present tariff as to prevent the importation of foreign wool under the names of ring waste, thread waste, yarn waste, etc., which are now used to evade tariff duty, declaring that it is largely due to these fraudulent importations of wool and improper classification, and the inequality of the tariff on woolen and worsted goods, that their industry has been so seriously checked in its development. The meeting decided to send a delegation to Washington to present to Congress the true needs of the wool industry of the South.

The convention seems to have lost its confidence in the Texas delegation in Congress, and in view of its opposition to the present tariff system and favorable consideration of free wool, they respectfully request S. J. Randall of Pennsylvania and William McKinley of Ohio to represent the Texas wool-growing industry when a revision of the tariff comes up in the House.

The wool-growers throughout the country appear to have their eyes fixed on Washington just at this time. The National Wool-Growers' Association met in convention at Washington on the 10th ult., elected their officers for the ensuing year and among other acts adopted resolutions declaring that while Congress maintains a general policy of protection, the wool-growers and wool manufacturers in the United States have the right to demand that the duties on wool and woolen and worsted goods shall be adjusted and maintained so as to secure to them the American market; protesting against the Senate Tariff bill so far as it affects wool; providing for a committee of seven to formulate such a schedule of tariff duties for wool as may be deemed just and necessary, and to present the same to the Finance Committee of the Senate and urge its adoption.

WASHING WOOL.—It is said that if a bale of wool should be placed for a considerable length of time in salt water the continued action of such water would in time completely dissolve the wool, while it would have no such effect on the bagging, whether made of cotton or jute. If we place wool in water with some caustic potash, and raise the water to the boiling point, the wool will soon be entirely dissolved. And yet, with a knowledge of these facts, many manufacturers and others will place their wool or woolen goods in the hands of ignorant persons, who freely use salt and soda ash and raise the water to the boiling point, and from this plunge the goods into cold water, unconscious of the evil results that must necessarily flow from such practice. Goods are in that way often deteriorated, and, although made from the best of wool, will not wear any better than the poorest shoddy. The washing of wool and woolen goods should be intrusted only to such persons as fully understand its peculiar nature. Only the finest and mildest quality of soap should be used in washing woolens. The process of washing wool, whether in the fleece or as manufactured goods, should be one of gentle persuasion. Soaps for wool-washing should be kept at a uniform heat and strength, which is best accomplished by using a thermometer instead of the hands, and the soap or alkali should be weighed, and not be thrown into the soap-tub by guess.

WHAT FREE WOOL WILL DO.—A gentleman writing from Buenos Ayres says: "If the United States Government changes the Custom-house tariff and opens the door to Argentine wools, we may look forward to a new era in the sheep-farming line. Furthermore, our relations with the States would become *Ipso facto* most important and a current of reciprocal trade would be established and of such a magnitude as to astonish our North American cousins. There would then be no need of Government subventions to start steamship communication with New York, and the mere repeal of the wool tariff would do more than all the ministers, commissioners, treaties and newspaper articles rolled together in opening up a brisk trade with this country."

A BRITISH COLUMBIA WOOLEN-MILL.—The Westminster woolen-mills, the only manufactory of its kind in British Columbia, has lately arranged to sell its entire make of blankets, for an unlimited period, to a wholesale firm in Victoria. The blankets turned out by the mills are principally light and dark grays, although some brown and white have also been made. It is the intention of the directors to add one or two more blanket machines next year. In tweeds these mills are making Oxford grays.

THE WORLD'S WOOL PRODUCT.—The total wool production of the world is estimated at 2,000,000,000 pounds. Australia is the heaviest producer, coming to the front with 455 570,000 pounds; then the United States, 307,388,000 pounds; the Argentine Republic, 283,047,000 pounds; Russia, 262,966,000; Great Britain, 135,000,000. All the other countries range each below 100,000,000 pounds.

FLOUR MILL NOTES.

The Future Center of the Wheat Supply.

Indications seem to point to the Pacific Coast as the future center of the wheat supply of the world. The area for wheat-growing in this region is immense, and the soil and climate well calculated to secure large and uniform crops; while its vicinity to the sea-coast, its two great central rivers, and the facility with which its valleys may be pierced with railroads, render it a country in every way most suitable for producing and moving a bulky crop like wheat. It is calculated that our two northern neighbors, with California, contain arable land enough to produce more than half the present wheat yield of the United States. When it is all improved, the center of the wheat market of this country will be shifted from Chicago to San Francisco, and the world will look with anxious eyes to this coast as the main source of the supply of the staff of life. But comparatively a small portion of the available wheat land of California has as yet been brought into cultivation, or at least not into thorough cultivation. Vast areas of our valley lands have never yet been turned over by the plow, and of that which has been sown, the small and uncertain crops which have been obtained are far less than what will be obtained, in the near future, when the mountain waters will be properly conducted into the valleys for winter irrigation.

We have the utmost confidence in the future glory and profit of our wine, our olive oil, our beet-root sugar, and of our small deciduous and citrus fruits; but with all the land favorable to such cultivation, fully employed, we will yet have sufficient to largely increase our present yield of grain—sufficient to even increase our present exports and feed the many millions who will soon cover our central valleys with a population as dense as is now seen in Southern Europe.

The future of the Pacific Coast will be phenomenal. Our climate, our soil and our facilities for the grandest and most complete irrigation system ever seen will continue for many, many decades to attract hither the enterprising and energetic people of Eastern and European communities. California will yet become the garden of the world and the busiest hive of industry on the face of the globe.

Corn and Wheat.

The corn crop of 1888 was by far the largest ever harvested in the United States. It will certainly exceed 2,015,000,000 bushels, an increase of not less than 550,000,000 or 600,000,000 bushels over last year's crop. This fact is full of significance as concerns the general business interests of this country. With such a yield of corn the farmers are sure to receive $200,000,000 more for their crops than in 1887, and that goes a long way toward insuring the prosperity of all classes and industries. An exchange in commenting upon the two crops—wheat and corn—says:

The high price of wheat and the fact that we have not enough of the latter to supply the demand from abroad make it very fortunate that we have an abundance of corn, and the consumption of that grain at home and its exportation to the Old World in place of wheat will probably be unprecedented. England alone will require much more wheat than we have for export, although it is hoped we may be able to spare about 85,000,000 bushels, and other European countries will need more than Russia, India and Australia together can supply. With a wheat crop of 512,000,000 bushels in 1885, we had a surplus of more than 150,000,000 bushels, and were the crop equally abundant in 1888, we could sell the whole at good prices; but Europe need not go hungry while our storehouses are overflowing with corn. The European palate has not the relish for maize which the exigencies of the situation make desirable, but the taste for the corn foods is constantly increasing, and, undoubtedly, the poor of the Old World would be benefited by its cultivation. However, it is thought by the farmers on remote prairies that it is more profitable to sell beef and pork than corn, and the surplus of the corn crop will be acceptable to foreign purchasers in the form of meat and other provisions which it can produce.

It will be well for the people of the United States to adopt the same policy as far as practicable, in all their dealings with other nations, and instead of exporting raw materials, endeavor to send abroad the manufactured product, fully prepared for the consumer's use. Our cotton crop, for example, would be worth double the money it now brings were it manufactured at home instead of being so largely exported in the raw state.

JAPANESE BUCKWHEAT.—We clip the following from a number of the Germantown (Pa.) *Telegraph* of three or four months ago, and from it infer that some of the Pennsylvania wheat-growers have been experimenting with some foreign variety of buckwheat: This new grain which has been subjected to the test of trial is perhaps coming more nearly to the recommendations of it than is ordinarily the case. We did not see the grain while growing, but from some stalks that were shown us of the seeded grain, we are compelled to say that it is very promising, being a very large berry. What the proportion of husk will be to flour or how the flour production of this variety will compare with the old varieties remains to be seen. The change of soil in the introduction of the variety may account for some increase in the size of the berry, but we should not expect to find so marked an improvement as is manifest. We have had reported to us the yield of 15 bushels from one peck of seed, and have seen mention of correspondingly large and even larger yields from this variety. If this is its natural production, it is sure to drive the old varieties out of use if its other qualities are fully equal to those of the old sorts. But in cases of this kind it is sometimes safe to "make haste slowly."

THE "FLOUR TRUST."—The reported "flour trust," the Northwestern millers declare, has not been formed, but it is admitted that at least 250 mills ceased operations January 1st, in conformity to resolutions adopted at a convention recently held in Milwaukee to the effect that the output of flour should be curtailed one-half. Mills scattered through the wheat belt representing a daily output of 75,000 barrels of flour are running at half their capacity or are closed entirely. The trouble is largely due to the artificial advance of last September, which forced cash winter wheat at St. Louis to $1.15 and spring wheat at Chicago to something like $2 in one day, cutting off shipments to Europe and reducing the domestic consumption. The shut-down will continue, it is said, until the flouring business is re-established on a paying basis. The decline in wheat since the Milwaukee meeting is about eight cents per bushel, but is still too high for export, either as wheat or flour.

MILLS AND BAKERIES COMBINE.—The time is not very far ahead, in all probability, when the system of mills and bakeries combined, which is prevalent in many parts of Europe, will become a common thing in this country. There are many reasons why it is both practicable and economical. As a baker, the miller knows just the grade of flour he desires to make and knows just what it costs him. The same motive-power needed to drive the mill will drive baking machinery, and where steam is used the necessary heat wanted can be furnished with little or no additional expense. There is no doubt but the miller-baker could furnish as good and often better bread for less money than the baker. Such combinations of business would necessarily be appropriate only in cities and large villages, and in such locations, if properly managed, they will, we think, be profitable to the projector as well as beneficial to the public.

DOUBLE REPRESENTATION ALL RIGHT.—At the millers' meeting recently held at Milwaukee, it was noticed that Dakota was present with a double representation. On that fact being brought to the attention of the chairman, that gentleman said: "Guess it's all right. They're going to have two States out there any way!" Dakota's double representation was allowed to stand.

WHEAT IN THE ARGENTINE REPUBLIC.—A few years ago the Argentine Republic did not raise wheat enough for home consumption. Last year it exported 7,000,000 bushels. Immense tracts of pasture are being converted into farm land, and the country is becoming a great grain-growing region.

TAR WEED IN THE WHEAT-FIELDS.—In many parts of Umatilla county, Oregon, the tar-weed has grown so rank as to ruin the wheat-fields. Near Adams all the fields will have to be resown.

A NEW FLOUR MILL has just been started at Fall River, Shasta county.

A PULVERIZER REPLACES A MILL.—The five-stamp mill on the Texas mine, owned by Hart & Fleming of Redding, Shasta county, has been taken down and in its place a Dodge pulverizer has been sent up by Parke & Lacy. This was not done because the stamps did not crush the ore, but because the ore "slimed" too much under the stamps, and it was found the pulverizer could reduce the rock without making slimes. A good many of these pulverizers are now being made and sold.

SENATOR LELAND STANFORD is reported as having announced his intention to have several of the buildings of the great Leland Stanford, Jr., University at Palo Alto, in Santa Clara county, open to receive pupils at the beginning of the next fall term. Four of the class-room buildings of gray sandstone with tiled roofs, are now nearly completed.

THE following bids have been sent in for the construction of an elevator in the New City Hall: A. J. McNichol & Co., $4500; W. T. Garratt & Co., hydraulic elevator, $5049; W. H. Burch & Co., four bids for different styles of elevators, $4830, $4695, $5555 and $3975.

IRON ORE FOR FLUX.—The Adelaide Copper Co. has built a road to the Buckner iron mine on Winnemucca mountain, Nev., and have let a contract for hauling three or four carloads of the ore to the depot for shipment to Golconda.

JOHN HAYS HAMMOND, M. E., has gone to Guatemala to report on some mining properties.

MARKET REPORTS.

Local Market.

SAN FRANCISCO, Feb. 7, 1889.

General trade continues quiet, but more activity is looked for in the near future, as large wholesale houses are preparing to have their travelers "on the road." Among iron workers, business is still quiet, but all speak hopefully of the outlook. The money market is easy, with more disposition to place funds, particularly after assessment day. There is a lighter call for exchanges on New York, which causes a shading off in the rate of exchange on the East. The very easy money market at the Eastern money centers and growing ease abroad, no doubt, have some influence in weakening New York exchange. There is a fair call for funds from grain operators on Call, but from mining stock operators (brokers) the inquiry is still light, owing to the outside public having very little faith in the stability of the present range of values, notwithstanding the news from the mines listed on the two exchanges is of a very favorable character. That from the Comstock mines is confirmatory of crosscutting having been commenced in Crown Point, Belcher, Yellow Jacket, Union, Mexican and Con. Imperial. In all these mines it is claimed that the prospects warrant the assertion that ore of much value will be run into, and that in the immediate future. In Seg. Belcher, crosscutting, it is said, will be commenced soon, while in Overman, the work going on presages more active and important work to be commenced soon In Utah and Sierra prospecting work is said to be under way. A report, from a reliable source, says that in Con. Virginia, on the 1500-foot level (continuation of the Ophir 1465-foot level) running southwest from the Ophir line, a winze is being sunk which is in rich ore, thought to be the same as that found on the 1750 and 1650 levels. In the Middle mines the work going on is said to be of the most important character. The Alta group of mines is beginning to attract attention from operators, owing to the action of the stock and the character of the work in the mines. From the Tuscarora and Bodie mines the news is of a favorable character.

There can be no doubt but the movements now on foot to regulate by law the voting of stock by proxy at annual elections, is having a favorable effect. But aside from this the strong probability that laws now forgotten will be enforced, is also bearing fruit. One of these we reproduce as follows, from the civil code of California, Act of April 23, 1880: Section 1. * * * * * It shall be the duty of the superintendent, on the first Monday of each month, to file with the secretary an itemized account, *verified under oath*, showing all receipts and disbursements made by him for the previous month, and for what said disbursements were made. It shall also be the duty of the superintendent to file with the secretary a weekly statement, under oath, showing the number of men employed under him and for what purpose, and the rate of wages paid to each one. He shall attach to such account a full and complete report, the amount of ore extracted, from what part of the mine taken, the amount sent to the mill for reduction, its assay value, the amount of bullion received, the amount of bullion shipped to the office of the company or elsewhere, and the amount, if any, retained by the superintendent. It shall also be his duty to forward to the office of the company a full report, under oath, of all discoveries of ores or mineral-bearing quartz made in said mine, whether by boring, drifting, sinking or otherwise, together with the assay value thereof. All accounts, reports and correspondence from the superintendent shall be kept in some conspicuous place in the office of said company, and be open to the inspection of all stockholders.

The two dynamos in use at the Nevada mill are working splendidly since the placing of the two governors in position to regulate the water-wheel. The other four governors will be ready the coming week, and when in place, the other four dynamos can be run and the mill ready to drop 60 stamps. This will also allow the California mill to start up with the water now used by the Nevada mill.

SILVER—The market shaded off the past week in sympathy with a decline in London and also in New York. The supply here is still very light, and what becomes of the bullion is a source of surprise, even to those operating in it. The last steamer for China took out for Hong Kong in silver bullion $36,000, and in Mexican dollars $148,671, and for Bombay, in silver bullion, $186,900. It is asserted with considerable confidence that the output of bullion on the Comstock will be increased this month, and this, too, in the face of a light supply of water. This claim, no doubt, is based on the fact that the dynamos for the Nevada mill are a success. After the sailing of the China steamer the Anglo-Californian bank entered the market and bought all the bullion obtainable at 92¾ to 92⅞c, at which price the market closed.

QUICKSILVER—The market continues quiet, but firm. It is being claimed by some mining men that the electric amalgamation process will save a larger percentage of quicksilver than is now the case, which they contend will lessen the consumption.

LEAD—The market shows more life, due to the salmon canneries laying in their supplies. Considerable is going up North. In prices there are no changes to report.

COPPER—Although there are no changes to report, yet the feeling is weaker, and some concessions, it is claimed, are obtainable. The weakness of the market is no doubt due to the large increased stocks and the increasing output.

IRON—The market shows a slight shading in some kinds of foreign, with a weak tone, owing to some holders wishing to realize. To arrive, there is no change, the high freight being against buyers. The consumption with us shows signs of increasing. The East reports the market depressed under stronger selling competition.

TIN—The market exhibits more life, with salmon canners in the market. Considerable is going forward to Alaska. Prices are unchanged for both plate and pig.

ANTIMONY—Although no change in quotations are reported, yet there is a stronger feeling at full asking prices. The East is reported to be slightly higher in sympathy with an advance abroad, due to a scarcity of ore.

COAL—The market is weak for all descriptions. The yards are full, while the buying is confined to immediate wants. The output of the coast continues large, while for house purposes the consumption is lessening. Some foreign coals on spot are quoted less than to arrive. Scotch splint on spot is quotable at $9 a ton; West Hartley, $10; Cardiff, $9; Liverpool steam at $9, and Liverpool gas at $8.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Feb. 7, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42 9-16	93	$16 75	$3 77½	$21 70
Friday	42½	92 13-16	17 00	3 77½	21 90
Saturday	42⅜	92¾	16 70	3 77½	21 75
Monday	42½	92¾	16 70	3 77½	21 80
Tuesday	42⅜	92¾	16 70	3 77½	21 70
Wednesday	42½	92¾	16 70	3 77½	21 00

Quicksilver is firmer, at 60@62c. Borax—8⅞@9¼c for refined and 8@8½c for concentrated. Lake copper is dull, closing at $16.70 for Feb.; merchants' lots, $16 for March. In pig lead, single cars sold at $3.77½; small round lots, $3.75. Tin is unsettled, nominally closing at $21.

By Mail.

The following is the latest from the "New York Metal Exchange Market Report":

Prices generally ruling for metals not regularly dealt in on Call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, $21.50@——; Billiton Tin, $22.50@——; Banca Tin, $22.25@22.50; Baltimore Copper, ——@——; Orford Copper, $16.00@16.25; P. S. C. Copper, ——@——; Foreign Lead, $4.75@5.00; Foreign Spelter, $5.95@6.00; Antimony, Hallett's, $11.25@11.37½; Cookson's, $13@13.25.

SCIENTIFIC AND INDUSTRIAL WORKS.—John Wiley & Sons have in preparation new books as follows: Manual of the Steam Engine; Steam Engine Design; Laboratory Guide in Chemical Analysis; A Technical Dictionary; Treatise on Masonry Construction; Elementary Text-Book of Chemistry; Thermo-Dynamics and Steam-Engine Experiments; Treatise on Hydraulics; Treatise on Physics; Kinematics or Practical Mechanism; Preparation of Organic Compounds; Flow of Water in Rivers and Other Channels; and other works. Among the important works published by this firm last year were Microscopical Physiography of the Rock-Making Minerals; Rocks and Soils; Stair-Building; Steam-Boiler Manual; Woolen and Worsted Manufacture; Masonry Dams; Mechanics of Engineering; Text-Book on Roofs and Bridges; Strains in Framed Structures; Field Engineering; Indicator Practice; Iron and Steel, Materials of Construction; Resistance of Materials, etc. Scientific and industrial works are now much more numerous than formerly, and nearly every branch of industry is represented in the titles. This firm make a specialty of books of this class and always get them up in very good typographical form. The authors are all men of mark in their line. Any of these works can be ordered through Dewey & Co., S. F.

ELECTRICAL SOCIETY.—The Electrical Society held its second meeting Wednesday night, and adopted a constitution and by-laws, founded on those of the Buffalo Society. It was decided that the society should be known as the California Electrical Society, and that its meetings be held on the first and third Monday of every month. The following officers were elected for the ensuing term: Prof. N. S. Keith, Pres.; O. Brooks, Vice-Pres; W. W. Wright, Sec.; C. R. Ryland, Jr., Treas.; P. B. Brown, S. H. Taylor and T. H. McDonald, Executive Committee. The society is already in a flourishing condition. There is some talk of making it a branch of the Mechanics' Institute.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JAN. 29, 1889.

396,972.—LID-RAISER—J. S. Anderson, Crescent Bay, W. T.

396,799.—BIBB FILTER—N. Beauregard, S. F.

397,070.—ORE SEPARATOR—E. Derbec, S. F.

397,071.—WATER-WHEEL—E. Derbec, S. F.

396,866.—DRILL SUPPORT — George E. Foster, Pleasant Valley, Cal.

396,872.—VEHICLE WHEEL—H. F. Hicks, Ashland, Ogn.

396,881.—HAY-FORK—W. H. Lander, Pendleton, Ogn.

396,823.—SAW-SETTING MACHINE—Alex Logan, Monterey, Cal.

396,947.—HOT-AIR BLAST—W. O. Mills, S. F.

397,092.—VENTILATING RAILWAY CARS—Murray & Harrison, San Rafael, Cal.

396,948.—GUARD FOR FISH NETS—Jacob Myers, Eureka, Cal.

396,834.—SIFTER—J. T. Quinn, Riverside, Cal.

396,774. — PAINT-OIL — A. Sommer, Berkeley, Cal.

396,965.—ELEVATOR SAFETY-ATTACHMENT—P. B. Sullivan, Tuscarora, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAN OPENER.—Thos. H. Gilham, Cortez, Nev. No. 396,555. Dated Jan. 22, 1889. This can-opener consists, essentially, in a fixed knife and a rotary piercing or gripping disk for engaging the can and forcing it against the fixed knife. It consists, further, in a vertically movable head carrying the knife and piercing-disk and a cam-lever for forcing the knife and disk to penetrate the can and for holding them when at work; also, in connection with said knife, disk and lever, it consists of a roller for the base of the can on which it may move freely.

GUARD FOR FISH NETS.—Jacob Meyers, Eureka, Humboldt county, Cal. No. 396,948. Dated Jan. 29, 1889. This guard is for the base or foot of the net, the object of which is to prevent the lead line from rolling up in and with the base or the foot of the net when the net is being dragged in. This guard consists, essentially, of a number of rigid or stiff pieces or bars, one end of which is secured to the lead line and the other end is secured to the net at a point above said lead line, thereby rendering the base or foot of the net incapable of rolling up. As the net approaches shoal-water the tendency is for the lead line to roll up in and with the foot of the net, forming in a short time a roll of material under which the larger fish escape; but by rendering the foot of the net stiff for a short distance this rolling up is effectually prevented and the net itself is allowed to bag outwardly to its full capacity, its lead line dragging closely along the bottom.

ELEVATOR SAFETY-ATTACHMENT.—Philip B. Sullivan, Tuscarora, Nev. No. 396,965. Dated Jan. 29, 1889. This safety attachment is intended for mining and elevator cages. Across the upper part of the cage extend two parallel shafts, which are journaled in the sides of the cage, the ends extending through and having locking dogs or cams fixed to their ends, so that when the shafts rotate in one direction the cams will engage the guides to prevent the cage falling. When the shafts are rotated in the opposite direction the dogs are held out of contact with the guide and the cage can be lowered or hoisted. Springs are coiled around the two shafts so when at liberty to act they will rotate the shafts and throw the cams or dogs into contact with the guides. Chains connected with the hoisting rope are coiled around the shafts, so when the weight is on the rope and chains, the shafts are turned so the dogs are held out of contact with the guides, but in case of breakage the springs rotate the shafts and the guides are engaged. The mechanism is also so arranged that if, while the cable is intact and the cage is descending, it may be found necessary to check the cage without notifying the engineer, it is instantly done, by releasing the clutch mechanism, a lever being provided for the purpose.

ADJUSTING AND SUPPORTING DEVICE FOR DRILLS.—Geo. E. Foster, Pleasant Valley, El Dorado Co., Cal. No. 396,866. Dated Jan. 29, 1889. This invention relates to a mechanism for supporting drills, which are worked from a column to which they are fixed. It consists of an independent rack extending along the outside of the column, parallel with its axis and movable around its periphery, and, in combination therewith of a clamp to which the drill apparatus is fixed, said clamp being provided with a pinion to engage the rack and a pawl-and-ratchet mechanism for adjusting the drill to the proper position, and a clamping bolt or screw for holding it when adjusted. By this device the drill may be adjusted easily and accurately, and no lifting or difficult work is necessary, the whole thing being easily handled by one man.

SAW-SETTING MACHINE.—Alexander Logan, Monterey. No. 396,823. Dated Jan. 29, 1889. In this machine the blow on the set-punch is delivered by a hammer which is operated by a rotating cam. The connection between the hammer and cam is an adjustable one, so that by having a series of cams differently timed the blows of the hammer are rendered more or less frequent. The same shaft which operates the cams operates a feeding device which engages the saw-teeth and carries them forward to the set punch. It follows, therefore, when a saw with a given number of teeth to the inch is being set the hammer connection is adjusted to the proper cam of the series, so as to time the hammer blows according to the teeth of the saw and the speed of its feed. When a saw with more or less teeth to the inch is being set the hammer adjustment is again made as required. The saw blade is guided and held in position by a wheel engaging its back edge and carried by a spring-controlled carriage which keeps the wheel up to the blade at all points of its length, no matter what may be its width. A smaller flanged wheel is used to hold and guide small saws, such as band saws. The set-punch, the anvil, the saw-supporting table, and all the guide wheels are made easily adjustable, so as to accommodate any saw, and the whole machine is, in fact, adjustable and complete for every purpose of saw setting.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

PARKE & LACY CO., Feb. 2. Object, manufacturing and dealing in all kinds of machinery. Capital stock, $400,000. Directors, Lyman C. Parke, Benjamin T. Lacy, Arthur F. Price, John O. Harron and M. S. Norton.

COLLEY MILL AND LUMBER CO, Feb. 2. Directors, C. J. Colley, G. W. Bothwell, J. Neatbrode, J. Newhouse and C. D. Scott.

GOLDEN GATE SALMON CO., Feb. 4. Object, to carry on a fish-canning business on the Pacific Coast. Capital stock, $100,000. Directors, John R. Daggett, Geo, Tasheira, C. P. Overton, Thos. Jennings and C. S. Baseford.

MT. DIABLO WINE CO., Feb. 5. Object, to produce and sell wines in Contra Costa county and elsewhere. Capital stock, $250,000. Directors, R. M. Hamilton, Alexander Hamilton, E. Simon, J. Newman and Moses Samuel.

Meetings and Elections.

CALIFORNIA POWDER WORKS, Feb. 4. Directors—Gardner T. Lawton, J. B. Haggin, N. Luning, M. A. de Laveaga, B. Peyton. Officers were elected as follows: President, Gardner T. Lawton; secretary, John F. Lohse; superintendent at Santa Cruz, B. Peyton.

PACIFIC ROLLING-MILL, Feb. 5. Directors—Wm. Alvord, N. Luning, James G. Fair, Edward Coleman and Charles S. Neal. The following officers were elected: Wm. Alvord, president; L. B. Benchley, general manager; Patrick Noble, superintendent, and C. M. Keeney, secretary and treasurer.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or of some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

For New Subscribers—Something New and Rare.

PACIFIC COAST RELIEF CHART.

PHOTO-FACSIMILE.

With subscription paid one year in advance for this paper, and 10 cents to pay postage and mailing tube, we will send a fine Photoplate Relief Chart of the Pacific Coast, embracing California, Nevada, Oregon, Washington Territory, and part of Montana, Idaho and Utah, Photographed from a topograph'cal relief model in plaster (5 feet 3 inches by 5 feet 6 inches in size), made recently by Isaac Winston and Prof. Geo. Davidson (the latter Chief of the U. S. Coast Survey on this Coast for the past 20 years).

While it does not take the place of an ordinary map, it illustrates, comparatively, the elevations and depressions of the principal mountains, valleys, rivers, lakes, ocean and bay-shores of the Pacific States and Territories, and makes a permanently useful, handsome and desirable picture for either library, office or home.

The charts are 19x24 inches, well suited for framing, if desired. It is as handsome, and even more durable, than an ordinary photograph. Seldom is so choice an article offered as a newspaper premium. Sent to old subscribers on the same terms on paying one year in advance of current date. Subscribe and secure this permanently valuable chart.

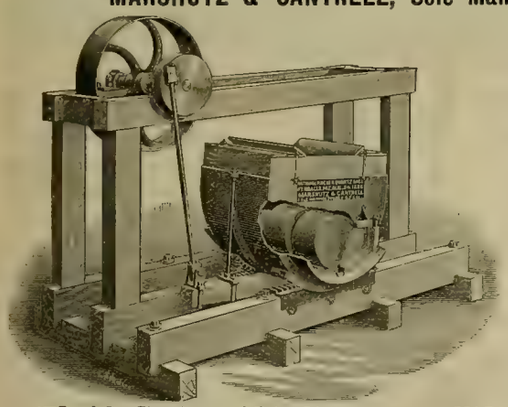
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞ Send for Circulars and Price List.

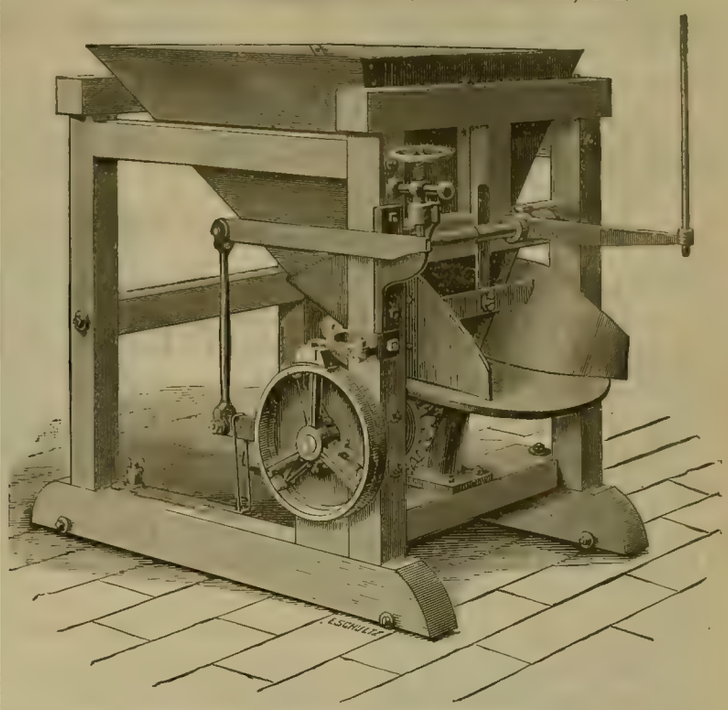
—THE—

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The **best form of Feeder ever devised,** and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

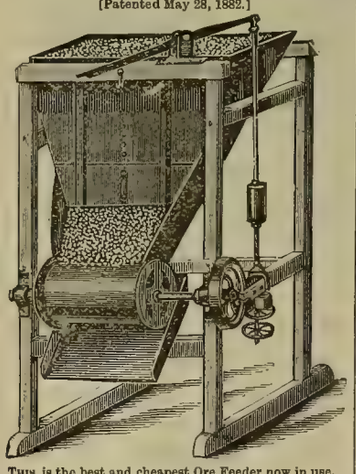
WE ARE MANUFACTURERS OF THE

CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

827 First Street. San Francisco, Cal.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A. F. JEWETT—Tulare Co.
F. B. LOGAN—Southern California.
H. G. PARSONS—Southern California.
GEO WILSON—Sacramento Co.
W. W. THEOBALDS—San Diego Co.
J. C. HOAG—San Francisco.
CHAS. F. BLACKBURN—Idaho.
FRANK S. CHAPIN—Colusa Co.

A BIG cave has been struck in the Copper Queen mine, Arizona. The cave is reported to be of mammoth dimensions, but no outsider is allowed to explore it.

Mining Share Market.

Mining stocks continue dull, notwithstanding all the leading Comstock mines have good showings of ore. The mills are gradually increasing the number of stamps with the continuance of the warm weather, which increases the volume of water in the Carson river by melting the snow on the foothills and on the southern slopes of the peaks along the crest of the Sierras.

The following companies have cash on hand, according to the monthly statements placed on file:

Alpha, $19,520.35; Alta, $63,414.21; Andes, $14,624.60; Best and Belcher, $1564.68; Bodie, $38,419.73; Bullion, $32,642.59; Benton, $95,901.87; Bulwer, $2528.25; Caledonia, $14,016.84; Con. Cal. and Virginia, $96,778.03, and unsold bullion amounting to $55,958.13; Confidence, $83,453.35; Con. Imperial, $18,833.71; Crocker, $448.75; Del Monte, $2060.52; Dudley, $178.91; Diana, $4482.35; Exchequer, $10.146.40; Found Treasure, $246 31; Hale and Norcross, $10,591.65; Independence, $2645.71 Justice, $9994.03, and $7949 in unsold bullion; Julia, $214.93; Lady Washington, $24,239.80; Locomotive, $1646.45; Mexican, $3727.89; Mono, $15,385.01; Navajo, $43,249.10, and unsold bullion amounting to $14,696.76; Occidental, $11,547.71, and balance due on assessment to collect, $1744; Ophir, $15,230.41; Overman, $1055.93; Sierra Nevada, $3554.13; Silver Hill, $12,836.59; Syndicate, $8870.71; Standard, $3064.83; Utah, $6704.16; Weldon, $1119.84.

The following companies have an indebtedness:

Belcher, $7914.15; Belle Isle, $2145.76; Challenge, $2174.12; Chollar, $313.48, with an offset in unsold bullion amounting to $26,750 45; Commonwealth, $36,432.83; Con. New York, $5375.01; Crown Point, $17,699.41; Grand Prize, $35,834.07; Gould and Curry, $9923.92; Holmes,$3253.73; Kentuck, $954.31; Nevada Queen, $32,060.90; North Belle Isle, $48,187.93; North Commonwealth, $8980.32; Peer, $7174.28; Peerless, $4482.17; Potosi, $21,162.63; Savage, $57,974.93; Scorpion, $228; Seg. Belcher, $9740.54; Summit, $119.03; Union, $3296.42.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Feb. 2, $2050; Bluebird, 2, $16,064; Justice, 6, $3266; Hanauer, 1, $2750; Con. Cal. and Virginia, 2, $63,251; Hanauer, 3, $1690; Queen of the Hills, 3, $1050; Bluebird, 3, $33,776; Confidence, 6, $25,219; Hale and Norcross, 6, $4641; Mt. Diablo, 6, $5636; total for January, $33,987; Alta, 2, $21,000.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic & Pacific Railroad. They contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postage, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

FOR SALE.

SECOND-HAND IRON PLANER,

Screw-Cutting Lathes from 12 to 30 inch swing, Punch Presses, Patent Attachment for Wood Lathes for Turning Tapers, Handles, etc. BEDROCK PRICES. Address: I. A. HEALD, 115 First St., San Francisco.

QUICKSILVER

For Sale in Lots to Suit by
PARROTT & CO.,
306 California St., San Francisco, Cal.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds $40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 26 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications intrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

STOCKHOLDERS' MEETING.

OFFICE OF

The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, San Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 18, 1889, at 3 o'clock P. M. By order of the Board of Directors.

J. M BUFFINGTON, Secretary.

OFFICE—Room 11, No. 303 California Street, San Francisco, California.

EXTENSIVE GOLD MINE FOR SALE.

To be sold at public auction by the undersigned, at the Merchants' Exchange, in the City of Halifax, on Thursday the Fourteenth day of March next, at twelve o'clock noon, that extensive, valuable and well-equipped Gold Mine known as the Dufferin Gold Mine, situate on the Atlantic coast, about ninety miles east of said city. Daily mail from Halifax. Telegraph office at Salmon river, four miles from the works. Salmon river harbor never freezes, and is safe and easy of access. The mine embraces 342 areas, each 150x250 feet, all in one block. The entire area measures fifteen hundred feet in width across, and eight thousand five hundred and fifty feet along the lodes. The leases have nearly fourteen years to run, and can at any time be renewed for a period of twenty-one years, upon payment of two dollars per area. Within this area is a belt of veins dipping on each side of an anticlinal. They have been found by tests made on the surface to extend upwards of 4,000 feet. The ore has been partially removed to a depth of 200 feet over a distance of about 700 feet, and to a depth averaging about 70 feet over an additional 1,000 feet in length or thereabouts. The veins are of various width, the largest averaging about ten feet of solid quartz.

This mine was discovered in the Autumn of 1880, but was not worked to any extent until the Autumn of 1881. It has yielded up to the end of November, 31,012 ounces of gold from 64,503 tons of quartz, according to the sworn returns made to the Mines Office. The gold can be produced at a cost which will leave a very handsome margin of profit.

The mine is operated by machinery worked by water power, the power being transmitted by a line of wire rope running from the water wheel to the mine—a distance of about 4,750 feet—and lying parallel to the outcrop of said veins, at a distance therefrom of about fifty feet. The Salmon river crosses the property twice. It supplies the hoisting and pumping power, and the same water is afterwards used to drive the crusher. The latter has thirty-eight stamps, and there is ample water power to operate three times that number. Sixty stamps can be operated with present machinery. Of the 120 horse-power existing for pumping and hoisting only about twenty-five is used. There are about 700 acres of well timbered and well watered land owned with the mine. This partly covers the areas, and where it does not immediately adjoins them. It is also provided with a steam plant to operate hoisting gear and pumps in case of accident to the transmission power, a sawmill, sufficient for the requirements of the property, a tramway from the mine to the crusher for carrying quartz, and stables, offices, and boarding-houses, sufficient to accommodate a large number of employees.

The mine is owned and has been operated by a partnership, and owing to the death of one of the principal owners it has to be sold to enable his estate to be settled. A good title will be given.

Terms, ten per cent cash, balance within thirty days from day of sale. The deposit to be forfeited in case the purchaser fails to complete the purchase within that time. Further particulars can be had on reference to N. H. MEAGHER, Q. C., Bedford Row, Halifax, or to JAMES DUGGAN & SONS, Auctioneers, Bedford Row.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,
NEWTON COPPER MINE, Amador Co

Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce

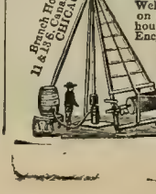
FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
Three 3-inch Sergeant Drills.
Three 5-ft. Double Screw Drifting Columns with Arms.
One 4-ft. Single Screw Stoping Bar.
One Set Sharpening Tools.
About 1500 pounds Drill Steel.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the
PAYMASTER MINING CO.,
Yuma, Arizona Territory.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Lefler, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide. Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft.; No. 2, 94 ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.



LIGHTNING WELL-SINKING MACHINE MAKERS.

Well-sinking and prospecting tools sent on trial. 229 feet has been sunk in 8 hours. Instructions for beginners. An Encyclopedia of 800 Engravings of well and prospectors' tools, pumps, wind and steam engines. A treatise on gas and oil. Book free, mailing charges 25 cts. each.

A VALUABLE PATENT
FOR SALE.
Grain-Saving Attachment

This Patent was issued to R. M. Cochran, Dec 22, 1885, and has proven its worth to the farmers of this coast. It can be attached to the combined harvesters now in use, as well as to stationary separators.
Recommendations as to the efficacy of the Grain-Saving Attachment can be furnished from the leading grain-growers of the coast. The purchaser will be given the entire right for the United States, without reserve. Detailed information can be obtained at this office, or of

SAFE DEPOSIT BUILDING, ROOM No. 2

THE DUCKER PORTABLE HOUSES

Combine all the comforts and advantages of a permanent building with economy, simplicity, stability, lightness, ease of transportation, quickness of putting it and taking down, ventilation, heating, and facility for cleansing. Suitable for Contractors' Uses, for Sheep and Cattle Ranches, Mining Camps and for Surveyors and Prospectors, Hospitals, Seaside and Summer Resorts, and in all localities where material and skilled labor are scarce and where economy in freight charges is a factor. These Buildings can be especially constructed for Hunting and Fishing Camps, Billiard Rooms, Photographers' Studios and Lawn Pavilions. They are built in sections and can be put up without the use of screws, nails or any external appliances whatever. Two men can put up a building, and carry around in 2 hours' time without skilled labor. Price, $250 to $750. Thoroughly reliable and influential business men only, may communicate with this Company relative to acting as its representative.
Address DUCKER PORTABLE HOUSE COMPANY, 32 Nassau St., New York.

Portland, Or. Sydney, N. S. W.
PARKE & LACY,
21 and 23 Frement Street, SAN FRANCISCO, CAL.

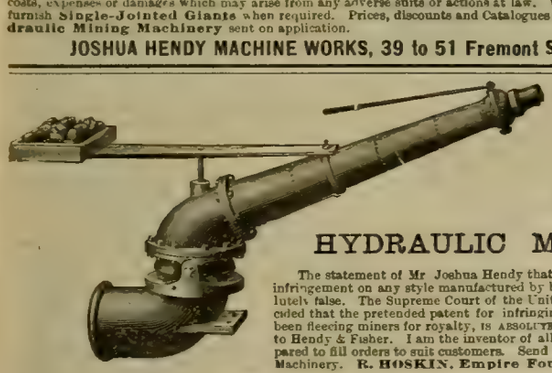
PACIFIC COAST AGENTS,
PARKE, LACY & CO., San Francisco.



HOSKIN'S
IMPROVED
ONE-JOINTED
HYDRAULIC MACHINE.

The statement of Mr Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

ESTABLISHED 1866.
Pacific Chemical Works.
HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist,
718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

"RED FLAX CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

PAT. OCT. 25, 1881.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A. F. JEWETT—Tulare Co.
F. B. LOGAN—Southern California.
H. G. PARSONS—Southern California.
GEO WILSON—Sacramento Co.
W. W. THEOBALDS—San Diego Co.
J. C. HOAG—San Francisco.
CHAS. F. BLACKBURN—Idaho.
FRANK S. CHAPIN—Colusa Co.

A BIG cave has been struck in the Copper Queen mine, Arizona. The cave is reported to be of mammoth dimensions, but no outsider is allowed to explore it.

Mining Share Market.

Mining stocks continue dull, notwithstanding all the leading Comstock mines have good showings of ore. The mills are gradually increasing the number of stamps with the continuance of the warm weather, which increases the volume of water in the Carson river by melting the snow on the foothills and on the southern slopes of the peaks along the crest of the Sierras.

The following companies have cash on hand, according to the monthly statements placed on file:

Alpha, $19,520.35; Alta, $63,414.21; Andes, $14,624.60; Best and Belcher, $1564.68; Bodie, $38,419.73; Bullion, $32,642.59; Benton, $95,901.87; Bulwer, $2528.25; Caledonia, $14,016.84; Con. Cal. and Virginia, $96,778.03, and unsold bullion amounting to $55,958.13; Confidence, $83,453.35; Con. Imperial, $18,833.71; Crocker, $448.75; Del Monte, $2060.52; Dudley, $178.91; Diana, $4482.35; Exchequer, $10,146.40; Found Treasure, $246 31; Hale and Norcross, $10,591.65; Independence, $2645.71 Justice, $9994.03, and $7949 in unsold bullion; Julia, $214.93; Lady Washington, $24,239.80; Locomotive, $1646.45; Mexican, $3727.89; Mono, $15,385.01; Navajo, $43,249.10, and unsold bullion amounting to $14,696.76; Occidental, $11,547.71, and balance due on assessment to collect, $1744; Ophir, $15,230.41; Overman, $1055.93; Sierra Nevada, $3554.13; Silver Hill, $12,836.59; Syndicate, $8870.71; Standard, $3064.83; Utah, $6704.16; Weldon, $1119 84.

The following companies have an indebtedness:

Belcher, $7914.15; Belle Isle, $2145.76; Challenge, $2174.12; Chollar, $313.48, with an offset in unsold bullion amounting to $26,750 45; Commonwealth, $36,432.83; Con. New York, $5375.01; Crown Point, $17,699.41; Grand Prize, $35,834.07; Gould and Curry, $9923.92; Holmes, $3253.73; Kentuck, $954.31; Nevada Queen, $32,060.90; North Belle Isle, $48,187.93; North Commonwealth, $8980.32; Peer, $7174.28; Peerless, $4482.17; Potosi, $21,162.63; Savage, $57,974.93; Scorpion, $228; Seg. Belcher, $9740.54; Summit, $119.03; Union, $3296.42.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Feb. 2, $2050; Bluebird, 2, $16,064; Justice, 6, $3266; Hanauer, 1, $2750; Con. Cal. and Virginia, 2, $63,251; Hanauer, 3, $1690; Queen of the Hills, 3, $1050; Bluebird, 3, $33,776; Confidence, 6, $25,219; Hale and Norcross, 6, $4641; Mt. Diablo, 6, $5636; total for January, $33,987; Alta, 2, $21,000.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic & Pacific Railroad. They contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postage, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

FOR SALE.

SECOND-HAND IRON PLANER,

Screw-Cutting Lathes from 12 to 30 inch swing, Punch Presses, Patent Attachment for Wood Lathes for Turning Tapers, Handles, etc. BEDROCK PRICES. Address: I. A. HEALD, 115 First St., San Francisco.

For Sale in Lots to Suit by
PARROTT & CO.,
306 California St., San Francisco, Cal.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigo ously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds $40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 26 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications intrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily —when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

STOCKHOLDERS' MEETING.

OFFICE OF

The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, San Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 18, 1889, at 3 o'clock P. M. By order of the Board of Directors.

J. M BUFFINGTON, Secretary.

OFFICE—Room 11, No. 303 California Street, San Francisco, California.

EXTENSIVE GOLD MINE FOR SALE.

To be sold at public auction by the undersigned, at the Merchants' Exchange, in the City of Halifax, on Thursday the Fourteenth day of March next, at twelve o'clock noon, that extensive, valuable and well-equipped GOLD MINE known as the Dufferin GOLD MINE, situate on the Atlantic coast, about ninety miles east of said city. Daily mail from Halifax. Telegraph office at Salmon river, four miles from the works. Salmon river harbor never freezes, and is safe and easy of access. The mine embraces 342 areas, each 150x250 feet, all in one block. The entire area measures fifteen hundred feet in width across, and eight thousand five hundred and fifty feet along the lodes. The leases have nearly fourteen years to run, and can at any time be renewed for a period of twenty-one years, upon payment of two dollars per area. Within this area is a belt of veins dipping on each side of an anticlinal. They have been found by tests made on the surface to extend upwards of 4,000 feet. The ore has been partially removed to a depth of 200 feet over a distance of about 700 feet, and to a depth averaging about 70 feet over an additional 1,000 feet in length or thereabouts. The veins are of various width, the largest averaging about ten feet of solid quartz.

This mine was discovered in the Autumn of 1880, but was not worked to any extent until the Autumn of 1881. It has yielded up to the end of November, 31,012 ounces of gold from 64,508 tons of quartz, according to the sworn returns made to the Mines Office. The gold can be produced at a cost which will leave a very handsome margin of profit.

The mine is operated by machinery worked by water power, the power being transmitted by a line of wire rope running from the water wheel to the mine—a distance of about 4,750 feet—and lying parallel to the outcrop of said veins, at a distance therefrom of about fifty feet. The Salmon river crosses the property twice. It supplies the hoisting and pumping power, and the same water is afterwards used to drive the crusher. The latter has thirty-eight stamps, and there is ample water power to operate three times that number. Sixty stamps can be operated with present machinery. Of the 120 horse-power existing for pumping and hoisting only about twenty-five is used. There are about 700 acres of well timbered and well watered land owned with the mine. This partly covers the areas, and where it does not immediately adjoins them. It is also provided with a steam plant to operate hoisting gear and pumps in case of accident to the transmission power, a sawmill, sufficient for the requirements of the property, a tramway from the mine to the crusher for carrying quartz, and stables, offices, and boarding-houses, sufficient to accommodate a large number of employees.

The mine is owned and has been operated by a partnership, and owing to the death of one of the principal owners it has to be sold to enable his estate to be settled. A good title will be given.

Terms, ten per cent cash, balance within thirty days from day of sale. The deposit to be forfeited in case the purchaser fails to complete the purchase within that time. Further particulars can be had on reference to N. H. MEAGHER, Q. C., Bedford Row, Halifax, or to JAMES DUGGAN & SONS, Auctioneers, Bedford Row.

HORACE D. RANLETT,

Ores, Mining, and Commission,

FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
Three 3-inch Sergeant Drills.
Three 5-ft. Double Screw Drifting Columns with Arms.
One 4-ft. Single Screw Stoping Bar.
One Set Sharpening Tools.
About 1500 pounds Drill Steel.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the
PAYMASTER MINING CO.,
Yuma, Arizona Territory.

THE CALIFORNIA CONSOLIDATED Gold Mining Company, Sierra City, Cal., A. Schubert, President; Alvin Fischer, Secretary; A. Leder, Superintendent. Divided into 300,000 shares at $1 each. Property comprises two locations. Ore assays $7 per ton, average. Coarse gold, solid rock; vein from 15 inches to 2 feet wide Tunnel No. 1 in 120 feet, and prospects well. No. 2 just begun. Stockholders: Alvin Fischer, A. Schubert, Gus Fischer, F. L. Fischer, Anton Fischer, Fred Fischer. For information concerning stock, etc., apply to F. L. Fischer, Sierra City.

THE BUFFALO CONSOLIDATED GOLD Mining Company, Sierra City, Cal., Ernest Busch, Superintendent. Stock divided into 600,000 shares at $1 per share. The property comprises 5 locations. Ore finely decomposed, carries coarse gold. Size of ledge: Tunnel No. 1, 32 ft; No. 2, 9½ ft.; No. 3, 10 ft. Fine black decomposed rock interspersed with white quartz. New 10-stamp mill run by a Pelton Wheel, blacksmith shop and boarding house. Stockholders: Ernest Busch, Hugh Murray, Frank Cook, J. G. Lee, Henry Carpenter. For further information apply to Ernest Busch, Sup't, or Hugh Murray, Sec'y.

LIGHTNING WELL-SINKING MACHINE MAKERS.
Well-sinking and prospecting tools sent on trial. 529 feet has been sunk in 8 hours. Instructions for beginners. An Encyclopedia of 880 Engravings of well and prospectors' tools, pumps, wind and steam engines. A treatise on gas and oil. Book free, mailing charges 25 cts. each.

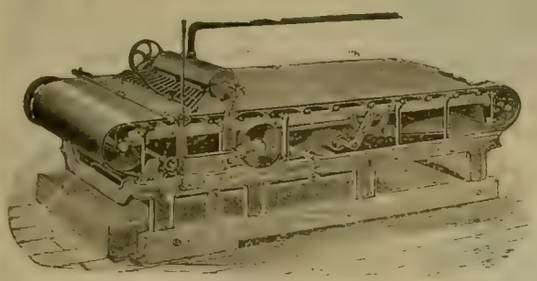
PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00).



THE "TRIUMPH" ORE CONCENTRATOR.

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

54-INCH BY 16 FEET STEEL BOILERS IN 2 SHEETS.

Cal. State Library Jl '89 21029

STEAM USERS, ATTENTION!

The engraving represents our standard 54 in. x 16 ft. Boiler. These boilers are made of homogeneous STEEL, and the shell, as shown, being in TWO PIECES, the advantage of this will be readily appreciated by steam users.

There are NO SEAMS in the fire to leak, nor loose rivets to contend with, caused by the continual expansion and contraction of the plate on account of the unequal distribution of the heat under the boiler, the bottom presenting a smooth, even surface which can be easily cleaned. We place a manhole at the back end above the tubes, and one in the front end under the tubes.

The FRONT MANHOLE gives free access to the sheet over the fire, THE VITAL PART OF EVERY BOILER. This point is often overlooked by purchasers, and boilers are supplied with a small hand hole, and the remaining space filled with tubes which allows absolutely no access for cleaning, and in a short time tubes and sediment are one solid mass, and instead of gain in efficiency by a few feet of tube surface, the result is a positive loss.

SPECIFICATION OF BOILER AND FIXTURES:

1 Boiler, 54 inches diameter by 16 feet, with 46 3½ inch tubes; Shell, 5 16; Heads, 7-16.
1 Steam Drum, 36 inches diameter by 72 inches long.
1 Breeching.
1 Smokestack, 30 inches by 60 feet, Nos. 12 and 14 Iron.
300 feet galvanized strand for Guys.
1 C. I. Front, complete.
1 Foundation Plate for front.
1 Set Grate Bars for coal or wood.
1 Back Bar Bearer.
1 Ash Cleaning Door and Frame.
1 Back Arch Plate.
1 Set Binder Braces and Bolts for Brickwork.
1 Stand for back end of Boiler.
1 Steam Gauge and Syphon.
1 Glass Water Gauge, complete, with column and 3 Gauge Cocks.
1 Safety Valve.
1 Stop Valve.
1 Feed Valve.
1 Blow-off Valve.
1 Check Valve.

These Boilers are tested to 150 pounds hydrostatic pressure and are intended for a working pressure of 100 pounds. Total weight of Boiler and fixtures, 17,000 pounds.

☞ BOILERS ON HAND READY FOR SHIPMENT. ☜ SEND FOR CIRCULARS.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

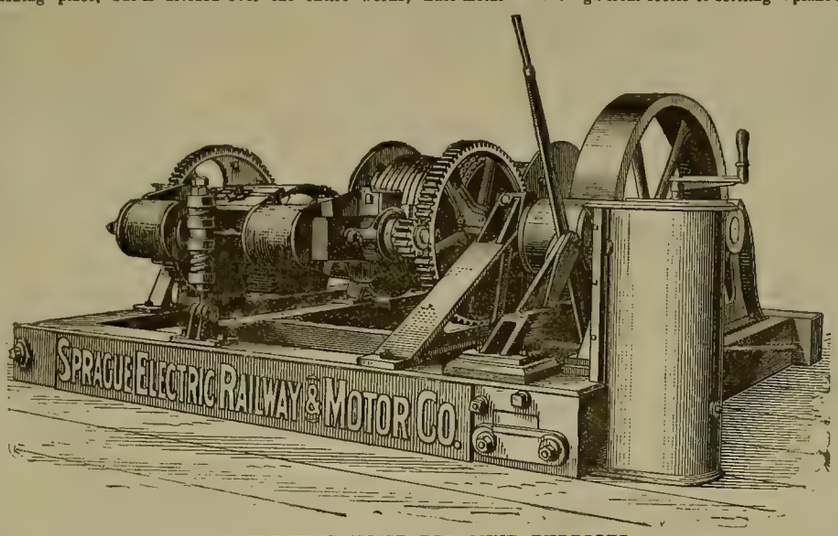
Trough-Lixiviation Works.

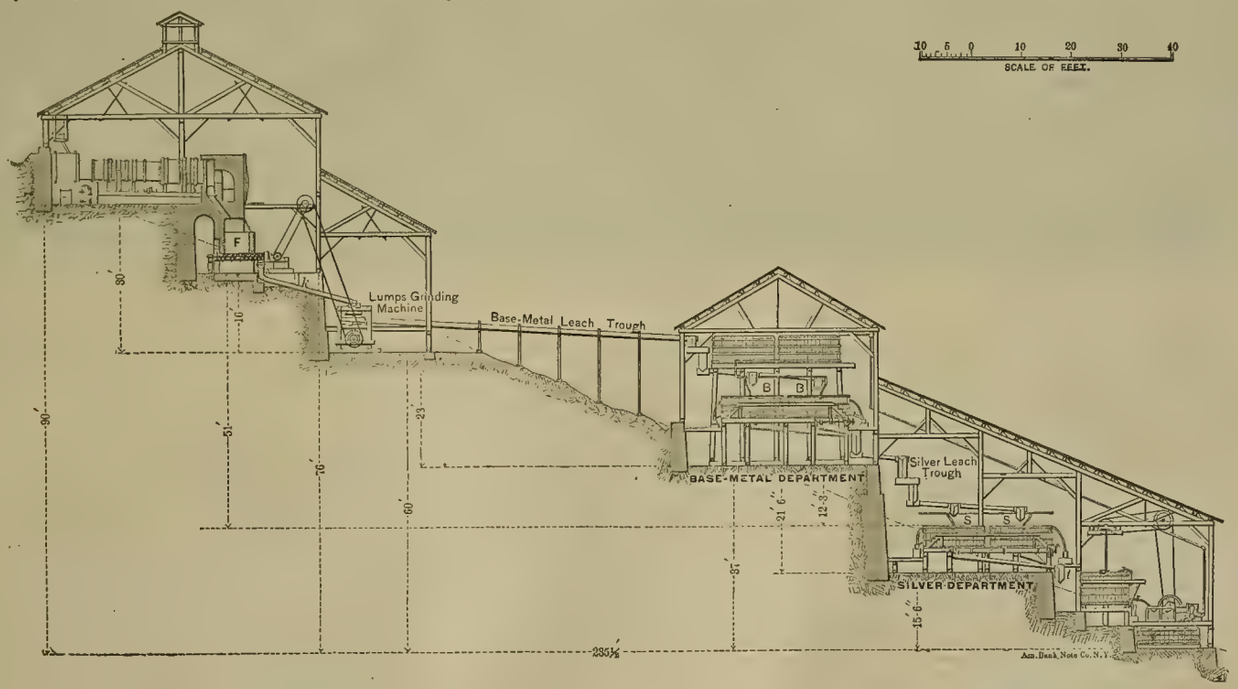
The accompanying cut shows Ottokar Hoffmann's complete trough-lixiviation plant, in connection with a Howell furnace. The leaching works are not in the same building as the battery and furnaces, but some distance down the slope of the site, in order to gain grade. Hot-ore feeder, ore-cooling apparatus and grinding machine are in the furnace building. The ore, after passing through the furnace, drops into the bin, *F*, from which it is removed after some hours by the conveyer, and drops through the cooler. From here the water carries it through trough *k* to the grinding machine. After passing through the grinder the pulp enters the base-metal leach-trough, which conveys it down to the base-metal department and drops into the settling-tanks *B*. While the ore passes through the trough, the base metals are extracted. From here the ore is sluiced out with sodium hyposulphite solution into the silver-leach trough and conveyed to the settling-tanks, *S*, in the silver department. The extraction of the silver chloride being performed in the trough, the sand drops into these tanks as tailings. The silver solution flows into the precipitating tanks and the tailings are sluiced out into tailing-trough *t*. The leaching troughs have ⅝-inch fall per foot, with the exception of trough *k*, in the furnace building, which has more (about 2¾ inches per foot) because the material to be moved in it is coarse. This trough is not triangular like the others, but has a round bottom in order to give the water a better opportunity to move larger lumps.

One of the objections used against trough lixiviation has been, that a mill with this system will require more fall than an ordinary mill. Though this is true, Mr. Hoffmann says he cannot see why this should be an obstacle to the new system. The additional grade is not needed as a sudden drop in one particular place, but is divided over the entire works; and by erecting the leaching works further down the site, no unusual steep slope is required. As a precaution against a total destruction of the works by fire, it is even advisable not to bring all the departments under one roof, especially in this case, where the transfer of the ore from one department to the other is performed automatically and without expense.

In order to illustrate that the extra grade required does not offer any difficulties in the construction of the buildings, and that the trough system does not require any unusually steep slope, or unusually large excavations, the plant is represented with excessively long troughs: Base-metal leach-trough from cooler to settling-tank *E* in the base-metal department, 293 feet, and silver-leach trough from tank *A* (base-metal department) to tank *E'* in silver department, 344 feet; in all, 637 feet. It can be seen at a glance that the plant can be erected without any difficulties, and that no unusually large excavations are required. The slope of the site as represented is 22°.



AN ELECTRIC HOIST FOR MINE PURPOSES.



CONTINUOUS TROUGH-LIXIVIATING WORKS, CONSTRUCTED BY OTTOKAR HOFFMANN.

THE decrease in the public debt in January amounted to $12,216,284.75.

An Electric Mine Hoist.

The Roaring Fork Electric Light and Power Co. has supplied power for some time from its plant to Sprague motors used at two mines at Aspen, Col., for hoisting purposes. The first electric hoist was started by the Aspen Milling and Smelting Co. last July, and the second was started in October, at the Regent mine, two miles from the dynamo. These hoists have been running continuously ever since, and giving satisfaction to all parties. The power of Grand river at the Falls of Roaring Fork is the generating source, which, by the use of Pelton wheels and a special dynamo installation of the Sprague type, is converted into electric energy and transmitted over miles of wire to the motors. It is essential that well-governed wheels should be used, as in this case, where water is the source of power. There are many places in California and elsewhere on this coast where this system could be of the greatest convenience and save money also.

We give herewith an engraving of this electric hoisting machine. It consists of an ordinary drum mounted on a shaft carrying a friction-wheel; another shaft, parallel to this one, carries a paper-faced friction-pulley, which bears against an iron-faced friction-wheel. For reducing the speed intermediate gears mesh into pinions on each end of the armature shaft close to the axle-boxes of the motor.

The motor used is similar to those which have given such great satisfaction in the street railway equipments by the Sprague Company, in the East, having on one side a flexible support, and being pivoted on the other side around the intermediate shaft.

(*Concluded on page 114.*)

CORRESPONDENCE.

We admit unindorsed, opinions of correspondents.—EDS.

Washington Territory Mines.

Ruby City Camp.

EDITORS PRESS:—In your issue of November 24, 1888, there appeared an item written by "Observer," Spokane Falls, W. T., from which I quote as follows: "Speaking of the mines of Ruby City, a good deal of work has been done on them. The Arlington mine on the surface averages 18 ounces silver. When $30,000 was paid for it by Portland capitalists and Prof. Clayton reported hundreds of thousands in sight, a tunnel boss from the Oregon Pacific road was put in charge of the property, who ran a tunnel 450 feet to gain a depth of 100 feet, at an expense of $15,000, while a shaft representing the same development could have been sunk for $1200. At 200 feet their ore body, 4½ feet wide, averages $15 per ton silver and is worthless. The First Thought, on the same hill, shows a good streak of pay ore and may survive the working test. The War Eagle and Idaho are losing propositions. The Fourth of July has had but little development work done."

Now, gentlemen, allow me, through the columns of your paper, to give the facts in this case. This being a new mining camp, I consider the above a slur and great injustice to this thriving camp. In the first place, the Portland capitalist did not pay $30,000 for the Arlington mine. Second, Prof. Clayton did not report hundreds of thousands in sight, as his printed report is now in my office. His report was made by request of this present company, and is based on facts, which are proved such, since the development made shows the average per ton on surface was about $84 in silver and traces of gold. The width of ledge on the surface is about six feet, between two well-defined walls.

The "tunnel boss" from the Oregon Pacific is another mistake. Not intentionally, but for want of true information. J. B. Tonkin, who was selected by the Portland company to superintend the Arlington mine, is an old, experienced California miner and millman, and has served as superintendent at various mines throughout the northern portion of California. He is considered as a first-class miner; he had also served in charge of tunnel works under gentlemen of Portland—E. J. Jeffrey, D. P. Thompson, John Bays and S. S. Cook—with good results and general satisfaction. At the construction of the California & Oregon road by the S. P. C., said Tonkin was in their employ as foreman in construction of tunnels from Delta to Ashland, Oregon. "Observer" is also wrong in his statement of tunnel work in the Arlington mine. A shaft was first sunk in the ledge to a depth of 105 feet, when the flow of water was so great the work of sinking was stopped, and a force of men commenced to run a tunnel to tap the ledge at a depth of 210 feet from the surface. This was commenced Dec. 7, 1887, and continued in hard granite and syenite for 418 feet, when the ledge was cut. The inclination of ledge from surface diverges 10 degrees from the vertical line, giving the mine a splendid chance for stoping, easy to timber, with an average ledge of five feet in width. This rock, taken weekly with an average of the entire face across the ledge, gives assays from $58 in silver to $204, and as high as $27 in gold. There is no question about the quantity or quality; it is the proper kind of machinery for the working of this ore that caused the delay in not putting a plant here in the summer of 1888. This company has now shipped 10 tons to Spokane Falls, a distance of 162 miles, to be taken to some part of Utah, to be treated by the Russell process. If satisfactory returns are made, the company will immediately purchase a plant and erect it this spring. This shows that "Observer" was never at the Arlington mine, or his judgment on mining must be very weak to say the tunnel cost $15,000, when a shaft could have been sunk for $1200. Such is not the case. As it is well known among mining men when there is a chance to run an adit it answers for a drainage as well as a passageway for removing of all the ore. This is the principal thing to take an advantage of in a hilly country where such mining privilege prevails. The suggestions of Prof. Clayton have been carried out to a dot as recommended in his report of sinking the shaft and then running a crosscut; also extending tunnels each way in the ledge, this being the only practical method in mining. A connection by raise was made to bottom of shaft, which gives fine ventilation for working below. The company also erected a large ore-house for the storage of all first-grade ores, which is now about filled.

The First Thought and Idaho, mentioned by "Observer," are good properties. They have high-grade ore in all three of them, including the War Eagle, which is owned and operated by St. Paul capitalists with successful results. The Fourth of July is now engaged in sinking a shaft next to the hanging-wall. This ledge is about 26 feet wide on the surface, producing considerable native silver at a depth of 40 feet. The calculations are that several plants will be erected here this summer, as there never were any better prospects found on the Pacific Coast than the outcroppings show in this camp. Time and money are needed to make it second to none. Three railroads are heading in this direction, and when completed, freights and fare will be cheap.

This camp is situated northwest of Spokane Falls 162 miles and about 40 miles from the British line. Wood is plenty and there is an abundance of water for mill purposes. The winters are rather cold, but the snow is only about three feet at an altitude of 4800. There is grass in abundance, with fine stock ranges. I hope "Observer" will read this with interest, and acknowledge the misstatement he made in regard to our healthy, prosperous and struggling camp. MINER.

Ruby City, W. T., Feb. 2d.

Reforming the Ballot.

A bill is now before the Legislatures of California and Missouri embodying the salient features of the Saxton electoral-reform measure which recently engaged the attention of the law-makers of New York. Nine bills have been introduced in the Indiana Legislature looking toward reform in election laws and methods of voting. Indeed, nearly all the Legislatures of the Northern States which are now in session are considering measures of this class. Never before has the movement in favor of reform in the ballot been so extensive or so powerful in this country.

In nearly every instance the electoral method that is sought to be adopted is a modification of what is known as the Australian method. The principal features of this method we have already given our readers. So far as present legislation is concerned, this scheme is no longer an experiment. As we have pointed out, it has been tried in England and Canada, as well as Australia, and has worked well. Nor is it wholly unknown to the United States. Massachusetts enacted a law of this sort about a year ago, which goes into effect at the next State election. Two cities of this country—Milwaukee and Louisville—have already held elections under an Act of this kind.

As we have just said, this scheme is no longer tentative. Wherever it has been tried it has given satisfaction. Wherever it has been in operation it has removed the most serious frauds and abuses that have clung to the system it superseded.

The measure now before the Legislature at Sacramento meets with much opposition from the politicians. They say it is not adapted to the institutions of our country. The test to which it has been submitted in the two American cities silences that objection. That test proves that this method of voting can be made serviceable in this country.

But we are told that our present law is good enough if its provisions were enforced. The fearful depravity and corruption at the last election in the city of San Francisco alone is a sufficient reply to this objection. Under the new scheme things cannot be worse, and may be better; let us therefore give it a fair trial.

The Government Irrigation Work.

Senator Stewart of Nevada seems to be the leader in irrigation matters at Washington. In another paragraph in this issue mention is made of his measure concerning streams which flow from one State into another. The telegraph also brings an outline of new propositions relative to the Government surveys looking to irrigation of arid lands. It seems Senator Stewart has offered an amendment to be inserted in the Sundry Civil bill, increasing the appropriation for surveys of sites for irrigating reservoirs in arid regions, and estimating the cost of construction thereof from $250,000 to $350,000. The amendment provides that when surveys and estimates for necessary hydraulic works have been completed for any section of land by said system of hydraulic works, the lands to be irrigated under such system shall be subject to entry under the Homestead law, provided no patent shall issue for any such entry until the construction of hydraulic works shall progress sufficiently to furnish water for the reclamation of the lands to be patented, or so much thereof as may be susceptible of irrigation. Any assignment, transfer or alienation of lands so entered prior to the issuance of patent shall be absolutely void and the lands shall revert to the United States. It is provided further that the Secretary of the Interior shall have power to make regulations whereby persons entering such lands may form co-operative associations for the purpose of constructing the necessary hydraulic works in any irrigation district in which lands are to be irrigated by said system, and the associations formed for such purposes may mortgage their right to lands entered by them for the purposes of obtaining funds for the construction of the necessary hydraulic works. Any mortgage or incumbrance made upon such lands without approval of the Secretary of the Interior is made void, the land to revert to the United States.

These propositions are interesting and important and should be thoroughly discussed by all those contemplating investment and enterprise in lands likely to be rendered available by the new Government work for irrigation.

IMPROVED FERRY-BOAT DECK.—The deck of a ferry-boat for the Clyde is movable, so that six elevators raise and lower it instead of needing movable landing stages and bridges.

Irrigation Districts.

Proposed Amendment to the Wright Law.

Two bills amendatory of and supplemental to the Act to provide for the organization and government of irrigation districts, and to provide for the acquisition of water and other property, and for the distribution of water thereby for irrigation purposes, commonly known as the Wright law, approved March 7, 1887, have been introduced in the Assembly by Hon. Vital E. Bangs of Modesto, passed by that house and reported to the Senate.

The first, introduced Jan. 24th, and designated as Assembly Bill No. 335, provides for changing the boundaries of any irrigation district, by excluding therefrom tracts of land which were included therein at or after its organization; "but neither such change of the boundaries of the district, nor such exclusion of land from the district, shall impair or affect its organization, or its rights in or to property, or any of its rights or privileges of whatsoever kind or nature; nor shall it affect, impair, or discharge any contract, obligation, lien, or charge for or upon which it was or might become liable or chargeable, had such change of its boundaries not been made, or had not any land been excluded from the district."

The owner or owners in fee of one or more tracts of land which constitute a portion of an irrigation district, may file with the board of directors of the district a petition praying that such tracts, and any other tracts contiguous thereto, may be excluded and taken from said district. The petition must describe the boundaries of the tracts to which it has reference, and it must be acknowledged in the same manner and form as is required in case of a conveyance of land.

The directors are required to publish notices of the filing of such petition for at least two weeks in the county where their office is situated and in every county within which lies any portion of the territory to be excluded, describing the lands, etc., mentioned in the petition and notifying all persons interested in or opposed to the change sought to present their objections in writing at the office of the board at a specified time—which shall be the regular meeting of the board next after the expiration of the time for the publication of the notice.

After hearing the petition and all objections thereto presented in writing by any person showing cause why the prayer should not be granted, the directors are to proceed in the manner provided for by the following sections:

SEC. 5. The board of directors, if they deem it not for the best interests of the district that the lands mentioned in the petition, or some portion thereof, should be excluded from said district, shall order that said petition be denied. But if they deem it for the best interests of the district that the lands mentioned in the petition, or some portion thereof, be excluded from the district, and if no person interested in the district shows cause in writing why the said lands, or some portion thereof, should not be excluded from the district, or if having shown cause, withdraws the same, and also if there be no outstanding bonds of the district, then the board may order that the lands mentioned in the petition, or some defined portion thereof, be excluded from the district.

SEC. 6. If there be outstanding bonds of the district, then the board may adopt a resolution to the effect that the board deems it to the best interests of the district that the lands mentioned in the petition, or some portion thereof, should be excluded from the district. The resolution shall describe such lands, so that the boundaries thereof can readily be traced. The holders of such outstanding bonds may give their assent in writing to the effect that they severally consent that the board may make an order by which the lands mentioned in the resolution may be excluded from the district. The assent must be acknowledged by the several holders of such bonds in the same manner and form as is required in case of a conveyance of land, and the acknowledgment shall have the same force and effect as evidence as the acknowledgment of such conveyance. The assent shall be filed with the board, and must be recorded in the minutes of the board; and said minutes, or a certified copy thereof, shall be admissible in evidence with the same effect as the said assent; but if such assent be not filed the board shall deny and dismiss said petition.

SEC. 7. If the assent aforesaid of the holders of said bonds be filed and entered of record as aforesaid, and if there be objections presented by any person showing cause as aforesaid, which have not been withdrawn, then the board may order an election to be held in said district to determine whether an order shall be made excluding said land from the district as mentioned in said resolution.

If at such election a majority of all the votes cast shall be against the exclusion from the district of the lands in question, the board shall deny and dismiss the petition, and proceed no further in the matter. But if a majority of such votes be in favor of the exclusion of said lands, the board shall thereupon order that the said lands be excluded from the district.

The remaining sections of the bill prescribe the manner in which details of business, consequent upon the order of exclusion, shall be carried out.

The second measure, introduced Jan. 25th and known as Assembly Bill No. 340, is the counterpart of the former, as it provides for enlarging the boundaries of an irrigation district, so as to include a tract adjacent. Its provisions as to petitions, publication of notices, hearings, denials, resolutions, elections, orders, etc., are similar to those of A. B. No. 335.

Under either of the above bills, an election is to be called only when objections are filed with the board, otherwise the board acts of itself. If it should agree with the objectors, then the petition for inclusion or exclusion of lands will be rejected without submitting the matter to a vote of the electors of the district. The election is called only when the board of directors are in favor of the petition and objections thereto are filed.

After either of the orders above referred to has been entered in the minutes of the board, and a certified copy has been filed in the County Recorder's office, the district affected shall be and remain an irrigation district as fully to every intent and purpose as it would be had no change been made in its boundaries.

In case of the inclusion or exclusion of any lands within any district by proceedings under the above Acts, the board of directors, at least 30 days prior to the next succeeding general election, shall redivide such district into five divisions, and one director shall thereafter be elected by each division.

Both these bills having passed the Assembly on Monday last, were reported in the Senate Tuesday and substituted for identical measures on the Senate file.

Interstate Water Rights.

It is telegraphed from Washington that Senator Stewart has introduced a bill, the object of which is to allow suit to be brought in the Circuit Court in either California or Nevada to determine water rights to streams rising in California and flowing into Nevada, and to enable parties to obtain service of defendants whenever they may be found.

Senator Stewart's bill is to amend Section 1 of the Judiciary Act as follows:

"That where the sole ground on jurisdiction is founded on the fact that the action is between citizens of different States, suit may be brought in the district of the residence of either plaintiff or defendant; and provided further, that when there is a controversy between citizens of different States involving the right to use water which flows from one State into another, and the plaintiff claims the right to use it in another State, suit may be brought up in the district where the plaintiff or defendant resides, and process may be used in any district where the defendant may be found."

There are in the irrigating regions many other localities to which this law will apply. Without such a law there is no practicable way of determining disputes.

AN ASTRONOMICAL SOCIETY.—At a recent meeting of the Pacific Coast Amateur Photographic Association, where Prof. Holden of the Lick Observatory was present, he said that, owing to newspaper enterprise, the results of the observations of the eclipse on January 1st, as far as they could be obtained, had been telegraphed throughout the world on the same day and had awakened great interest among astronomers. He had received several letters of inquiry from leading astronomers in Europe, and in his replies to some of them he had said that one of the most interesting features of the event was the extent and value of amateur co-operation, which could not have been obtained anywhere else in the world. The speaker then proceeded to unfold his plan for an amateur astronomical society. He had such a society in mind when he came to the coast to reside three years ago, but, observing the failure of several similar societies elsewhere, had concluded that the project had better rest. He had recently found that an astronomical community does exist in California, ready to co-operate with the observatory, and now was the time to organize this spirit of co-operation and this interest. The society, if formed, would have placed at its disposal at certain times—probably on nights during the summer months—the facilities of the Lick Observatory, which could be visited on certain nights. Many members of the association expressed themselves as enthusiastically in favor of the project, and during a lengthy discussion, in which Professor Holden showed how amateurs could render very valuable service by supplementing the work of the professional astronomers and doing work which they could not find time to do. It was determined to take definite steps to form the proposed society in the near future.

IMPORTING ALIENS.—With reference to a scheme for inducing immigration from Europe to California, the Fresno *Expositor* observes: Though not an advocate of Americanism as a political scheme, we are intensely American when it comes to filling up this country with foreigners brought over in job-lots as colonists. To the foreign-born person who has sufficient energy and manhood to come over and become one of us, a hearty welcome should be given, but for such as must be "induced," there should be no encouragement. Let's have no foreign colonies in the San Joaquin valley. There are thousands in our country who are virtually as ignorant as any resident of Europe of the resources and possibilities of this State whose presence might possibly be desirable, and we are satisfied that the larger portion of the contributors to the Board of Trade's fund will agree with us that it should be expended in advertising our advantages among our own nativity, of our own language and customs, and who are cognizant of our principles of government.

THERE are 15,000 photographic establishments in the United States, furnishing employment to about 50,000 people. Less than 50 years ago there was not a photographic camera in the world.

The Nation's Forests.

The first step in the effort to provide for the conservation of the forests on the national domain should be the withdrawal from sale of all forest-lands belonging to the nation. It will not be necessary to preserve and maintain all these forests permanently, but the extent of forest-territory which will be required by a practical plan of forest-preservation and management for our Western mountain regions cannot be at once precisely determined. A thorough examination of these regions, and of the agricultural country depending upon them for its water supply, will be necessary, in order to show what forests must be retained, and what tracts of timber can be put upon the market without injury to the important interests involved. Until such an examination has been made, none of the forest-lands now belonging to the United States should be sold.

The second step should be to commit to the United States army the care and guardianship of the forests belonging to the nation. There is in time of peace no other work of national defense or protection so important as this which the army can perform, and it is plain that under existing conditions the forests on the national domain will not be—indeed cannot be—adequately guarded and protected by any other means The measures which have been tried, including those now in operation, or nominally in operation, have proved almost ineffective. The forests on the public lands are pillaged by settlers, and by the employes of railroad and mining companies, without scruple or limit. Other instruments will have to be employed if the forests are to be preserved. Their complete and final destruction, with that of the soil which sustains them, is, under the present system, or want of system, only a question of time, and of a very short time.

The officers of the United States army are educated by the nation for its service, and they constitute a body of men not equaled by any other in our country in their equipment for guarding and protecting the great forest-regions belonging to the nation. They possess every kind of fitness for this work in greater degree than any other class of men, and if authorized by law to undertake this service they would have the power and the means necessary for its performance, while everybody else is at present inevitably powerless and incapable. As there is likely to be very little work for the army hereafter in the care of the Indians, it will be available for this service of guarding the national forests. The work can be done well by the army, and it would cost nothing, or very little, while any other plan would necessarily be both ineffective and costly. This guardianship and defense of the nation's forests by the army of the nation should be continued and maintained until a sufficient number of adequately trained and equipped foresters has been provided by the National Government for the administration of a complete and permanent system and policy for the management of the forests on the public domain.

This brings us to consider the third step. This should be the appointment, by the President, of a Commission to make a thorough examination of the condition of the forests belonging to the nation, and of their relation to the agricultural interests of the regions through which the streams flow which have their sources in these forests, and to report, with the facts observed, a comprehensive plan for the preservation and management of the public forests, including a system for the training, by the Government, of a sufficient number of foresters for the national forest service.

The Commission should determine what portions of the existing forests on the public domain should be permanently preserved, and in what manner the remainder should be disposed of. The national forests can be so managed that they will be perpetually reproduced, and will yield forever an abundant supply of timber for the inhabitants of the adjacent country, and a revenue which will more than sustain the cost of the forest service. A National School of Forestry should be established at a suitable place in one of the great mountain forests on the public lands, and its equipment should be as thorough and adequate for its purpose as is that of the National Military Academy at West Point.—*Garden and Forest, Jan. 30th, 1889.*

The Date Palm in Fruit.

We have had a number of allusions to the date palm in California and engravings of the tree and the fruit, but none which presents the subject so directly and forcibly as the large photo facsimile on this page made by the Dewey Engraving Co. from a photograph by W. R. Nutting of this city, who has given much attension to the catching of horticultural subjects with the camera.

The engraving is interesting from several points of view which we will briefly sketch. The scene is in front of the residence of J. R. Wolfskill, who, since 1842, has made his home on the south bank of Putah creek. The pioneer himself, in his eighty-sixth year, still full of interest and activity in horticulture, which is his chief delight, is seen in the foreground, while his oldest son, Edward Wolfskill, a prominent business man of the town of Winters, appears upon the step-ladder. Aside from the personal interest which pertains to these portraits, their figures serve to show the hight of the palms.

The engraving shows the male and female date palms, the taller tree on the left being of the masculine persuasion. Even though the trees are so near, it is found necessary for fructification to take the blossoms from the taller tree and suspend them near the opening bloom of the bearing palm. It has been observed also that the fruit growing on the side of the cluster nearest to the suspended branch is perfect, and has seeds, while on the side farthest away many imperfect fruits are seen. For this reason the male bloom is broken to pieces and they are hung up here and there around the prospective fruit clusters. The smaller palm began bearing fruit in 1877. It was then 15 years old, as the seed, taken from a dried date, was planted in 1862. The fruit is of a red color and becomes ripe and of good flavor. As the fruit ripens it turns black and falls.

The photograph from which our plate was made was taken about the middle of October, 1888, and some of the fruit was then ripe, and the mass of fruit was estimated to be twice the size of a flour barrel. About November 1st a cluster was taken from the tree and brought to the office of the State Board of Trade in this city, where it was suspended in the front window and was the admiration of all visitors. It has hung in the same place for nearly three months, and some of the fruit is still in eatable condition.

The tree is not in a favorable situation. It is so near the residence that the ground around it is continually hard-tramped and it is crowded by large olive trees and other growths adjacent, and yet it is full of thrift. Until two years ago it was not irrigated, but the scant rainfall has led to its refreshment artificially.

The success of these dates and others in the same neighborhood of which we shall soon present another engraving, shows well how important it is that more attention should be paid to this fruit. All California date palms are seedlings. The University Experiment Station is now endeavoring to secure the importation of the best Algerian varieties, which have to be secured by buying suckers or offsets from the most famous African trees. We trust the effort will succeed, for it is just as important that we should have the best varieties of dates as of other fruits.

DATE PALM IN FRUIT ON THE GROUNDS OF J. R. WOLFSKILL NEAR WINTERS, YOLO COUNTY, CAL.

ASTRONOMICAL STUDIES.—At a recent meeting of the Regents of the State University the following resolution was adopted: "That so many graduate students as can be furnished accommodations at Mount Hamilton, without expense to the University, not to exceed four for the present, may pursue astronomical studies with the director at the Lick Observatory. Such graduate students must be either candidates for the higher degrees of the University in the ordinary manner or special students admitted with the consent of the president of the University and the director of the observatory. Such candidates for higher degrees shall spend at least one year in their studies at Berkeley."

THE LARGEST ELECTRIC LIGHT in the world has been placed in the light-house at Haustholm, on the west coast of Jutland. This light is said to be of 2,000,000 candle-power, with a range of 26 miles.

Passing Events.

A number of new quartz-mills are being built for the coming season. The quartz industry in this State is in a very flourishing condition at present, and is furnishing employment to a great number of men.

Fears of a "dry year" are felt all over the State. There is very little snow in the mountains and the water-courses are low for this time of the year. This will seriously affect the mining interests the coming season. This is not only the case in California, but in Nevada. A general "hanging up" of the river mills on the Carson may result.

The Comstock mines are now doing very well. Reports for the last quarter show that the total number of tons of ore extracted was 46,551, producing bullion valued at $891,898.38. The total product of the Savage, Gould and Curry, Occidental, Hale and Norcross, Alta, Overman and Six-mile Canyon is not included in the above list, which will swell the total to $1,250,000. The bullion product of the lode during the quarter ended Sept. 30, 1888, was $1,175,000.

The change of the electric railroad at Sacramento to a horse-car line and the complaints about that at San Jose, combined with the stoppage of the roads in Los Angeles and San Diego, are serious matters for the promoter of electric transmission on street railways to consider. Some better system than any we have in California is needed.

Electric Street Railways.

Whatever may be the condition of electric street railways in other parts of the Union, the experience with them in California has been, to say the least, unfortunate. Not a single electric road in this State has accomplished the work laid out for it, or been in any way successful from either a mechanical or financial point of view. Where the fault lies we are unable to say, but the fact remains.

The electricians of one system say the fault lies in the other system; others again say the roads were built for real-estate speculation and were never intended to run; and still others maintain that the roads will run all right if they can be made to pay.

Only this week the Sacramento electric road, after having had $6000 spent on it in experimenting, has been given up, and the road will, in future, be operated by horses. They tried the Wharton storage system.

The Los Angeles electric railway, about which there was so much talk, never was a success. The full number of cars were never run and not long since the road was practically given up. The Daft system was used here.

The San Diego electric road, on which $130,000 was spent, has also stopped running, the reason given being that there is not business to warrant it. Still, if we are rightly informed, it never did run as many cars as originally intended. Overhead wires were used, the system being that of Henry.

The San Jose electric road has been running a few cars on the Fisher-Rae system, but has not proven a success, though some $200,000 has been invested, according to the San Jose *Mercury*. Larger dynamos than originally designed have been procured, and many changes made, but the road is still in an experimental stage. The people are so inconvenienced that they demand the removal of the dummies, dynamos, etc., so that horses or other power can be applied and the cars run with more regularity. The unsatisfactory condition of this electric road has been officially considered by the city council and referred to the Street Committee. In San Jose it is considered a complete failure.

We are told, and we see by Eastern newspapers, that in other cities electric roads are running successfully. People from these cities, however, who have examined some of these roads, say they are not successful. When examining one road which was not doing what was expected, they were told of successful ones in other cities, and when they saw them the same story was told.

We see in the Eastern technical journals advertisements and descriptions of the roads tried here, from which it would seem that they were all that was claimed for them. Yet we know to the contrary to our sorrow. So far all tried here have been apparently experimental, for constant changes have been made.

Elsewhere we are credited with prejudice on this subject on account of the wide use of cable roads in California. But there is no prejudice aside from that in favor of a system that works well as against one which does not work at all. We speak of what we know. We see cable roads running regularly without breakdown and accommodating the public early and late; we see electric roads running intermittently and discommoding the public, and finally stopping altogether. Small sections of electric roads have been experimented with in Oakland and in San Francisco, but have not created a sufficiently favorable opinion to cause the investment of money. If electric roads can be built and operated cheaper and better than cables, then we would drop cables for electricity, except on our hills, but thus far the experience of California, with the systems tried here, has not been favorable to electric transmission. It is claimed that other systems not yet put at work here are satisfactory elsewhere. When we see a good electric road in California the street-railroad men and the public will have more faith than at present. All the money put into them so far has been practically lost.

Elastic Sandstone.

An item headed a "Geological Curiosity" is going the rounds of the press just now. A Washington *Star* reporter found the curiosity lying on the desk of the Acting Chief Clerk of the War Department. He says: "It weighed about a pound, and was, perhaps, 13 inches in length, and 2½ in width, and one-third of an inch thick. There was no doubt about it being a genuine stone, but it nevertheless possessed the flexibility of a piece of india-rubber. When taken in the hand and shaken in the direction of its flat surfaces, it would bend back and forth with a dull, muffled sound. The movement was more of a laxity in the adhesion, apparently, than an elasticity. When held horizontally by one end, the other would drop and remain in that position. With the two ends supported on rests, the free center could be pressed half an inch below the middle line. With one end held firmly on the desk, the other could be bent upward over an inch. The movement was not confined to the one direction—in the plane of the flat surfaces—but the entire stone seemed to be constructed on the principle of a universal joint, with a movement perceptible in all directions under pressure."

This is what is known as Itacolumite, or elastic sandstone. We have a fine piece of the substance at this office, where it can be examined by any one interested. The piece in question was obtained by Mr. A. T. Dewey at the Centennial Exposition. The label accompanying it says that the "Itacolumite is the reputed matrix of the diamond." It is very much as described above and is covered with micaceous specks or particles which shine brightly with a golden hue in the sun. The piece in our possession is about six inches long, an inch wide and a quarter inch thick. It is very flexible in all directions.

It is stated that a whole mountain of it exists in Southern Nevada, a short distance east of Death valley. It is found in California, Georgia and other localities in the United States. Itacolumite is nearly always to be found in regions producing the diamond.

Assaying Gold and Silver Ores.

"Assaying, Part 1, Gold and Silver Ores," by C. H. Aaron, has reached a second edition. The new volume contains 124 pages, which is about 24 pages more than its predecessor. Among the new matter will be found additional examples of dressing ore assays, an extension of the subject of weighing by oscillation, two more original methods of determining the value of specimens, never before published in any work, and shorter than others, tables of fractional assay tons in both grammes and grains; and last, but not least, a simple assay balance which any one can make in an hour, and which is really capable of doing good work.

The introduction of so much new matter with so small an increase in the number of pages is in part due to the omission of the original preface, but mainly to the well-known terse simplicity of the author's style, to which must also be ascribed the fact that his works are uniformly successful in a pecuniary sense. And yet Mr. Aaron is one of those who write neither for fame nor for gain, but simply for love of the subject; such writers are always honest and earnest, and, if the subject be useful, are generally successful. There has always been a good demand for Mr. Aaron's works. They are written in plain, clear style, free from puzzling technicalities, and, while useful to the skilled mining engineer and metallurgist, are equally so to the uneducated miner or millman.

We can conscientiously recommend this little volume as the best practical handbook for practical men. It is sold by Dewey & Co. Price $1.

THE DEBRIS COMMISSION.—The Government Debris Commission has commenced an official investigation of the localities affected. The members of the Commission were shown around Marysville this week by officers of the Anti-Debris Association. They have now gone to Oroville, and from there will go to the Cherokee hydraulic mine, one of the largest on the coast. It will take several months more to finish the gathering of data, and the time for filing their report is very uncertain.

THE Fish Commissioners are preparing to protect the perch in Tulare lake; also to stock it with black bass.

An Electric Mine Hoist.

(*Continued from page 111.*)

The flexibility is obtained by strong spiral springs placed around a vertical bolt, which is attached to a bracket secured to the base frame and passes through an eye bolt which is screwed into the outside pole piece of the motor, one spring being above and the other below the eye bolt.

Sudden shocks due to changes in direction, or intensity of force required, are taken up by a slight oscillation of the motor against the springs; the armature pinions and intermediate gear teeth being thus relieved of strain, and wear and noise of teeth are thus kept at a minimum.

This arrangement, which has given such satisfaction at Aspen, was first introduced by Mr. Sprague in attaching motors to axles of street-cars. Direct attachment of motors to axles was tried in Europe and given up as a failure, and it was left for Mr. Sprague's skill to discover the cause of the failure and apply an excellent remedy.

The reduction of speed from the armature shaft to the intermediate shaft is about one to six, and the reduction from this to drum shaft about the same. As the motor is of ten-horse power capacity, it is readily seen that such reduction permits of a great lifting effort. The direction of rotation is reversible by a sudden movement of the switch-handle.

The switch, occupying a vertical position, is incased in a box, the switch-handle being attached to a shaft which projects through a hole in the top. The body of the switch is a non-conducting cylinder having on its surface metallic contact plates, which are connected in various combinations with the coils of the compound-wound field magnets. The combination is changed by a simple motion of the switch-handle, and in this way the speed may be varied independently of the load.

The control of the drum is effected by throwing the friction-wheels in and out of gear, by braking the large friction-wheel against a shoe-brake placed beneath it, and operated by the same lever which controls the eccentric, and by variation of the motor activity as above described. Thus the most delicate control in handling the heaviest weights is secured.

The Sprague Co. has a department devoted to mining and milling work, with Mr. C. W. Jenks, an experienced miner, having supervision over it. This department has successfully equipped several large plants, and is at work upon others.

THE PARKE & LACY CO.—The Parke & Lacy Co. filed articles of incorporation last week to carry on a general machinery business, with a capital stock of $400,000, which has been subscribed as follows: L. O. Parke, $199,000; B. T. Lacy, $199,000; J. O. Harron, $1000; A. F. Price, $500; and M. S. Norton, $500. The old firm of Parke & Lacy has dissolved and the company has taken its place. This corporation includes the San Francisco and Australian houses. In Portland, the business of Oregon and Washington is carried on by the "Parke & Lacy Machinery Co." In Salt Lake, Utah, and Butte, M. T., practically the same firm conducts business under the title of the "Utah & Montana Machinery Co." The business has largely increased of late years, necessitating the formation of these corporations.

FOUNDRY NOTES.—The Morley M. Co., owning the Wetzlar claim in Hunt's gulch, three miles south of Jackson, Amador county, has let a contract to the Risdon Iron Works for the erection of a complete 20-stamp mill, to be completed on or before the 15th day of June, 1889. The mill is to be furnished with four Challenge ore-feeders, eight Frue concentrators, and operated by Pelton wheels. The contract also includes an air-compressor. The price is $41,624, not including masonry work.

IT has been found that the fire in the Calumet and Hecla copper mine extended downward 1300 feet from the starting point, making the total depth of the burned portion 2100 feet. The experiment of letting the fire in the mine burn out has proved that the forcing down of a carbonic gas saved the mine below where the fires started on former occasions.

THE proposed Nevada amendment to have a State lottery has been voted down by the people.

Mining in Large Bodies of Soft Ore.

The system of mining in use at the Iron River mine, Menominee region, Michigan, is well adapted to ores hard enough to stand over the width of the vein. In the accompanying cuts, Fig. 1 is a section across a stope and shows the method of work. The system was described by R. P. Rothwell of New York in a paper before the American Institute of Mining Engineers. The ore is taken down in an overhand stope running the width of the vein for any desirable length, and for a hight of say 12 feet. A timber-drift is then built along the floor of the stope, and the balance of the stope is packed with waste sent down from the surface through winzes previously sunk or upraised at intervals of about 50 feet in the length of the stope. A "mill" or chute is carried up every 50 feet along the level to run the ore down, and is made about four feet square inside, being built of round, rough, hardwood sticks.

The spaces between the sticks when they do not fit closely are filled with pieces of plank, and the inside of the "mill" is lined with hardwood planks spiked on to the side timbers. These planks are easily replaced when worn.

The packing is leveled over as close to the backs of the stope as is convenient for working, and is planked over, to keep the ore from mixing with the filling.

The "mill" is carried up before the filling as high as this is to go, and when the filling is leveled off a few large sticks are laid across the mill, leaving intervals large enough to throw the ore down, but narrow enough to prevent the falling in of a man or a block of ore large enough to choke up the outlet from the mill.

This method of work is extremely satisfactory where the ore is strong enough to stand without timbering across the vein. It requires no timber except the level and the mills, and the use of some plank, and it permits of the extraction of all the ore. The cost at the Iron River mine for the filling is given at 13 cents per ton of ore extracted; but the conditions were extremely favorable, and the filling did not replace all the ore extracted, so that the average cost will probably much exceed this figure.

Mr. Rothwell believes it will be found very much more simple, economical and advantageous in every way to work the vein out from the top down, instead of from the bottom up. The accompanying sketches (Figs. 2, 3 and 4) show the suggested method of work so fully that but few words will be necessary to describe it. Instead of driving the main level and crosscuts every 50 feet in the footwall, as in the Chapin method, I would drive the main levels in the vein, *A A A*, Figs. 2 and 3. (On the footwall would generally be the most convenient, though it is not essential.) This is possibly because the ground is undisturbed, and a level the width of an eight-foot set can be kept open, no matter how soft the ore may be. This will do away with the deadwork.

At intervals of say 100 feet (which, like other details of the system, will be determined by the hardness of the ore and other local considerations) the vein will be crosscut *B B B*, and stoped out the width of one set up from one level to the next above, a distance which will also be regulated by the nature of the ore, but may be counted at from 10 to 12 sets in hight.

However soft the ground may be, it will be possible, even with comparatively light timber, to hold a stope only eight or nine feet in width running across the vein in the solid well-drained ore. This will take the place of winzes and cross drifts at much less cost, and will serve as a pocket or chute to hold the ore, which can be drawn from it into the cars below, or the mill or chute through which the ore is sent down can be built, say three feet six inches by four feet on the clear section of round hardwood sticks, lined with hardwood plank, as in the Iron river mine, on the footwall, as shown in the drawings.

By a little care in packing around it this can probably be held in the packing, as a waste "mill" or chute, or, if it be found desirable, the "mill" can be cut in the footwall, as indicated by the dotted lines in the drawing.

When the cross-stope reaches the upper worked-out ground, longitudinal stopes, *C C C*, of one or two sets in hight and one set in width are driven to half the distance between the cross-stopes, or, as in the drawing, six sets, leaving intervals or pillars between them of two sets in width or more if the ground permit.

These longitudinal stopes are timbered lightly, having to stand but a very short time, and being in the solid undisturbed ore with the filling from above resting on each side of these on solid ore.

When the mid-distance between the cross-stopes is reached the backsloping commences by taking out the ore on each side, *E E E*, of the *C C C* stope to the width of a set, or half a pillar left between the longitudinal stopes *C C C* supporting the "gob" roof while doing so, and laying lagging poles or slats across the floor of the stope as the work proceeds. Any waste rock or material available or desirable may be thrown back on the packing, and when a space, *E E E*, the area of one or two sets is worked out on each side of the last sets of the longitudinal stope, *C*, the temporary timbering is drawn; the "gob" roof with the lagging previously laid under it is allowed to drop on the bottom of the stope *C C C*, *E E E* lagged to receive it. Light poles, or even brushwood, will serve for thus keeping the ore from mixing with the waste.

It will probably be found possible, as well as advantageous in many cases, to drive these longitudinal stopes *C C C* two sets high and draw back the upper one a little in advance of the lower, and as they can be driven out at any point in the cross-stope *B B*, as shown in Fig. 2, a whole horizontal slice or section of the ore body, no matter what its thickness, can be opened out, say two sets in hight at the same time.

The advantages claimed for this system of mining are: First, there is no deadwork in it; all the work is simply stoping. Second, all the levels and stopes that have to be timbered are in solid, undisturbed ore, and being only one "set" in width, are easily held and require but light timber, while much of this is drawn and saved in letting the roof down. When the stope comes up to the filling this has only to be supported over one set of timber, while it rests on the solid ore on each side of this. Third, the packing follows the ore down, and as long as this occurs the cave on the surface can be constantly filled from "borrow-pits" much cheaper than by sending the filling below. If finally found desirable, the filling can be sent down, as in other cases, through "mills," etc. Fourth, this system renders it possible to obtain practically all the ore in the vein, and to get it free from mixture with waste. Fifth, disastrous caves are impossible.

MECHANICAL PROGRESS.

How Common Circular Saws Are Made.

Ordinary circular saws are of all sizes, from six inches to six feet in diameter. The plates from which they are shaped come from steel-mills in circular form, almost round, if not perfectly so. The first thing to be done is to see that each plate is made a perfect circle. A hole is then cut in the center, and the teeth are marked around the rim. The plate is then taken to a machine on which the teeth are to be cut. It is placed upon a pin at such a distance from the machine that the edge becomes beneath the die, and the operation of teeth-cutting begins. The steel is cut cold, each tooth being made by one blow. All sizes and descriptions of dies are necessary, as the style of saw and saw-teeth are many. After the teeth have been cut the next operation is that of tempering, which is the most difficult and important process in the making of a saw. Several saws are placed in the furnace at a time, and allowed to remain until they have reached the proper temperature, a light cherry red, when the plates must be taken from the oven and plunged into a vat of whale oil, heated by pieces of red-hot iron or steel, which are placed in the vat one after another until its contents are properly heated. As each piece is dropped in, a brilliant flame leaps from the surface of the oil and continues to burn until extinguished by stirring the liquid with a long iron rod. The large, glowing plates are then cautiously slid into the vat. Leaving the tempering department, the saw goes back to the main shop to be hammered and straightened ready for grinding. This work is done by hand. After the plate, which has been more or less warped in the tempering process, has been made perfectly straight again, it is placed in the grinding machine, which is a carriage between two wheels, which turn it, and at the same time press its sides against a rapidly revolving grindstone. The carriage is fixed in automatic bearings, and is moved back and forth at the will of the operator. It usually takes about two hours to grind a large five-foot circular saw, though the time varies according to the kind of saw that is being made. The next operation is that of polishing, which is done with emery-wheels. To polish a large circular saw the plate is secured to a large wheel or flange, which turns, carrying the saw with it, the workman meanwhile pressing an emery ball (attached to a handle) against the side.

The saw must then be "rounded," that is, care must be taken to prevent one tooth projecting farther than the others. For this purpose the saw is placed in a bearing and made to turn slowly. It is then gradually brought in contact with an emery-wheel, the latter turning very swiftly, until the edge of every tooth touches the wheel. The saw is next sharpened and submitted to further hammering for the purpose of "truing" and straightening, and is then cased ready for shipment.

One important part of the sawmaker's business is the renovation of old saws injured in fires. It is straightened up, tempered over again, and provided with a new set of teeth.

This article has dealt only with common, circular saws, the teeth of which are not separate from the plate. Other saws, however, supplied with inserted teeth of various kinds, are made in large numbers. These are all patent saws, and can be supplied with new sets of false teeth as often as necessary.

A HIGH COMPLIMENT.—The "Encyclopedia Britannica" says, in an allusion to a Pittsburg iron firm, that it is more modern in every way than any of the iron-mills in Europe. Considerable space is given to a description of plate-rolling and also cold-shaft rolling at the works of the firm. The article then continues: "The marked feature in most American iron works is the general handy, compact and efficient nature of the machinery of all kinds and the uses of various physical exertion-saving contrivances and arrangements for ventilation and cooling of workshops, etc., many of which appliances are not so frequently to be met with on the eastern side of the Atlantic, more especially in England. The general arrangement and planning out of the works, moreover, is usually far superior to that of the older British works, which have gradually grown to their present dimensions, and consequently have not been systematically laid out as a whole. In consequence of attention to such details as these, the output of finished material from a given amount of plant is frequently considerably greater in America than would be attained in other countries, while the labor required is not proportionately increased; thus the largest makes of Bessemer metal from a given converter ever registered have been obtained in American works, so in other instances."

FRICTIONLESS BEARINGS.—An ingenious improvement in the manufacture of frictionless bearings has been recently invented, says *Iron* of London, and is now being introduced. These bearings are made of babbitt metal, or some other similar alloy, and they are cast in solid metal chills, which are worked up with the greatest accuracy, so as to produce externally of the bearing of the exact outline of the interior of the plummer block, while the interior of the bearing corresponds mathematically with the journal which it is intended to support. The chills are, moreover, so designed that the bearings would form a complete circle but for the intervention of a dividing plate, which separates the metal, and forms two castings, each complete in itself, and together forming a perfect circle. The cast-iron plummer blocks are also constructed as to present uniform interiors for the reception of the bearings. The chief merit of this system consists in the absence of the friction caused in all gun-metal bearings, which have been bored or machined, however carefully, in consequence of the exposure of the rough edges of the minute particles which form the surface of the bearing, and which catch against microscopic projections on the surface of the journal. In Mr. Garrett's bearings no boring or machining takes place, the metal being cast in chills. The bearing surface is consequently composed of unbroken molecules of metal, and since these molecules do not possess individual strength to resist the friction of the journal, they are flattened to a perfect polish, and a great economy of power and lubricant results. It has long been usual to bush metal bearings by pouring Babbitt's metal in a molten condition into the cavity existing between a journal and its bearing, the latter being purposely bored out larger than the journal for this purpose; but it has remained for Mr. Garrett to produce accurately finished and interchangeable bearings of this material, such as can be readily replaced by others of mathematical identity when replacement becomes necessary.

IMPROVEMENT IN THE MANUFACTURE OF STEEL SPIKES.—A series of experiments were recently tried at the Etna Iron Works, in Pittsburg, in the manufacture of steel spikes. The object was to make a finished article by rolling the bar so that its width would be the length of the spike and in such a shape that the spikes may be cut from it with shears, pretty much as a cut nail is made except that the head is formed in the rolling process. The first test was made by running through some steel rails that had been slowly heated for 2½ hours. The result was fairly successful, and it was thought that a few changes in the rolls would make the operation entirely satisfactory. Should the scheme be successful, it will work a revolution in the cost and manner of making railroad spikes.

THE CAUSE OF SPONGINESS IN FERRO-SILICON AND CINDER IRON.—There are differences of opinion among ironmasters as to the cause of the sponginess in ferro-silicon and cinder iron. There are some among scientific experts who think this phenomenon is due to contraction in cooling, and refer for illustrations to a similar phenomenon observed in the earth's crust, which is universally attributed to contraction. The majority of experts, however, dissent from this explanation, holding that it cannot be due to mere contraction of the metal, because there is a distinct bubbling up of the molten metal, which sometimes shoots up to a hight of several feet. Hence there must be some internal development of gas which produces the disturbance and consequent sponginess.

ENGLISH AND AMERICAN PACKING.—A correspondent of London *Engineering* refers to the rough usage of machinery on shipboard, and to the fact that the admirable manner in which American machinery is packed gives American manufacturers an advantage. He cites instances in which heavy castings from English houses are broken, and says: "Quite fragile castings, such as stoves (from American manufacturers), are delivered in perfect order, owing to the admirable packing." The manner in which machinery is packed has a good deal to do with the shape in which it gets to its destination, and the shape in which it gets to its destination has a good deal to do with future orders.

THE GREAT DISTRIBUTING CENTER OF IRON. Chicago is the largest distributing market for the various grades of iron and steel in the country, and it is here that some of the largest rolling-mills are located. Of these, there are seven which give employment to 6749 workmen and have an aggregate capital amounting to $11,000,000. Taking all the manufactures of iron and steel in all their various forms and they number 255, with an aggregate capital of $23,915,000, give employment to 21,219 workmen, and have turned out a product the past year valued at $54,945,000. The amount of wages for 1888 foots up $14 000,000, which is something less than during 1887.

RAPID INCREASE IN THE DEMAND FOR STEEL RAILS.—An English paper gives the following statistics in regard to the increased demand for steel rails in Japan, the Argentine Republic and Mexico. The comparison is between the first 11 months of 1887 and those of 1888: Japan, from $362,575 to $899,695; the Argentine Republic, from $826,425 to $2,865,610; in Mexico, from $9774 to $310,405. In the demand for railroad materials of all sorts, the Argentine takes the lead, the value of such demand having increased from $1.478,965 for the first 11 months of 1887 to $3,018,396 during the corresponding period of 1888.

THE United States produced 7832 net tons of spiegeleisen and ferro-manganese in 1875, and 47,598 tons in 1887. The year of largest production was 1886, when 47,982 net tons were produced.

SCIENTIFIC PROGRESS.

The Mechanical Feature of the Dust Explosion.

A few years ago, says the *Monitor*, such a story as recently came from Chicago regarding the explosion at the oatmeal factory, would have been received with general incredulity. That a force, comparable in its efforts with dynamite, could have been developed through the burning of the dust so familiar in the atmosphere of flour-mills, would not have been believed. Subsequent investigation seems to show that dynamite *was* at the bottom of *that* mischief, but this will not affect the argument.

The subsequent destruction of a candy factory and of one of the great flouring-mills at Minneapolis, as well as numerous lesser accidents, have familarized the public mind with the possibility of such catastrophes. But there are some who are still unable or unwilling to be convinced that flour dust may be as fatal as gunpowder. The difficulty is this: If fire comes in contact with powder, dynamite or any other ordinary explosive, the result is certain and instantaneous. An atmosphere of dust, on the contrary, may for years be in contact with a flame. That without any apparent change in its character, it should suddenly explode after so long demonstrating its harmless qualities, seems incredible.

The enigma would be less perplexing if the mechanical properties of matter were more generally understood. The latest advances in scientific investigation prove more and more conclusively that mechanical modifications are at the bottom of all the varied forms and properties of matter; that we are, in fact, dealing with a substance whose essence is the same, whether it be gold or iron or earth or water, or any other material with which we are acquainted—that it is the building up of the atoms, their mechanical structure, which determines to which of the great classes of metals or minerals the substance shall belong. The same atoms may be gunpowder, or they may be clay; they may be water or air or lead, according to their mechanical arrangement. Chemistry in its last analysis would seem to be nothing more than the laws and principles of the mechanical arrangement of atomic quantities.

When this truth is recognized it is easier to understand how a dust-laden atmosphere may suddenly develop the most dangerous properties after years of apparent harmlessness. That dust will burn in the presence of flame and air, and that the product will be a gas much greater in volume, all will admit who have ever tossed a handful of flour dust on the fire. But the conditions under which a dust-laden atmosphere will burn are so peculiar that, experimentally, they rarely occur. Every boy who has kindled a bonfire knows how much his success will depend upon the arrangement of the sticks and the strength of the fire already started. Until sufficient volume of flame is secured each stick must be carefully adjusted to support the slow combustion of its fellows. But once under full headway, he may toss his sticks as he pleases, and they are instantly licked in the embrace of the roaring fire.

Somewhat after the same fashion we may regard the flour dust. Until the distribution of particles has reached a point where they will sustain each other in creating a volume of flame, no explosion will occur. The individual particles in contact with a lamp or candle may be insensibly consumed, while their fellows float harmlessly around them. But once the precise conditions are present, the flame, with ever-increasing energy, shoots through the mass and the explosion follows. Fortunately, the conditions favorable to such a disaster are so rare that skepticism still prevails.

The Influence of Sunlight on Trees.

In the latest report of the head of the Forestry Department of the United States, reference is made to the effect of light on the growth of various trees. It is well known, says Prof. Ferrow, that light is necessary for the development of chlorophyll, and, therefore, for the life of all green plants, and especially for that of trees. The heat alone, which accompanies the light, is not sufficient, although the relative influence of the light and the heat on the growth is still an open question, as well as the relative requirements in light of different species of trees. In the case of forest weeds, which in forestry serve as an indication of the amount of shade which the trees exert, and with their capacity of impeding evaporation, some require full sunlight for their development, others are averse to a high degree of light. To this must be due the change in the plants of a district when its forests are removed. Then the amount of shade needed is modified by site. Where the sunlight is strong, in higher altitudes, drier climates, or where the growing season is longer, or there are more sunny days, some species will endure more shade. The flora of high altitudes in general requires light.

Trees nearly always develop best, in other words, make most wood, in the full enjoyment of light, but their capacity of developing under shade varies greatly. The yew will thrive in the densest shade, while a few years overtopping kills the larch; the beech will grow with considerable energy under partial shade, where the oak would only just keep alive, and the birch would die. When planted in moist places all species are less sensitive to the withdrawal of light. In the open, maples, elms, sycamores, and others grow well and make good shade trees; in a dense forest they thin out and have but scanty foliage. Conifers, such as spruces and firs, which preserve the foliage of several years, have, perhaps, the greatest capacity of growing under shade and preserving their foliage in spite of the withdrawal of light.

In America sufficient data to group the forest trees according to the amount of light required by them have not yet been collected, but rules based on experience have been formed in Germany, where the behavior of trees under different conditions of light has been carefully studied. It has been found, for instance, that on the same branch those leaves which are developed under the full influence of sunlight are not only larger and often tougher in texture, and thicker, but that they have a larger number of stomata or breathing pores than those less exposed to light. The whole subject is one of the utmost importance in forestry, and observations and experiments are to be carried out in regard to it in the United States.—*Builder and Woodworker.*

LETTERS AND POSTAGE HERE AND IN EUROPE. In 1792 the postage for a single letter in this country was 25 cents for a distance of more than 450 miles. Now the rate is two cents for 3000 miles or less. The people now demand one cent postage. The deficiency in the post-office revenues for 1888 is less than half of what it was in 1885, showing wonderful increase in business. We have in this country 57,376 postoffices. Germany has 18,688, Great Britain 17,587, and France 7296. Russia, with more than twice our territory and nearly twice our population, has less than a tenth as many postoffices. Our mail routes cover 403,976 miles; those of Germany, 85,885; those of Great Britain, 41,275; and those of France, 65,334. The American mails carried last year 3,576,100,000 pieces, letters, papers and packages; the British carried 2,279,532,000; the German, 1,816,066,000; the French, 1,463,249,000. The average number of pieces carried for every inhabitant of the United States was 71; of Great Britain, 61; of Germany, 41; of France, 37. The postal expenditure last year in America was $55,795,358; in Germany, $44,348,949; in Great Britain, $28,876,235; in France, $28,327,666. In all these figures the telegraph service of foreign nations has been omitted. Our letter and postal card rates are the same as those of Great Britain, and cheaper than those of Germany and France.

CELESTIAL DISTANCES.—The planet Venus is about 26,000,000 miles away; or, at 60 miles an hour, without stopping, she is distant from the earth a journey not of three weeks, or six months, but of some 50 years. On an imaginary railway, such a journey would be possible, for a great many persons live longer than 50 years. But in real life no one ever has traveled, and no one ever will travel, anything like so far. No human being ever has traveled 5,000,000 miles, and it is safe to say that no one ever will. To complete this measure of journeying would require an average of 100,000 miles a year for 50 years. And yet, with the exception of our moon, Venus is the nearest of all the innumerable hosts of stars to the earth. Who can appreciate the amazing mystery of space?

A BURNING LAKE IN INDIANA.—According to a recent press dispatch from Vincennes, Ind., a small lake, one mile east of that village, is blazing fiercely and emitting a sulphuric odor. Those living near the burning lake are preparing to leave the place. The lake is a pretty body of water about half a mile in diameter and surrounded by a dense forest. It has always been a great hunting and fishing ground. Two hunters, who were after wild geese, were the first to discover the phenomenon. The flames rise about six inches from the surface of the water and burn with a pronounced flicker and a purplish alcoholic color. There is no smoke. Scientists who have visited the place, it is reported, cannot explain the mystery.

ORIGIN AND EROSION OF THE MISSISSIPPI RIVER.—As a possible theory of the origin of the Mississippi, Messrs. Robert Bates and John A. Kayes suggest that its erosion was accomplished by means of a mighty cataract which began far down the river near its original mouth, and by gradual retrogression dug out the valley-like gorge which is so marked a feature in the upper part of its course, and left the high bluff walls on either hand. This view makes St. Anthony's Falls the ever decreasing and receding remnants of the once most stupendous cataract the world ever saw, having a perpendicular descent of perhaps 600 feet. The time required to cut the entire channel is placed at 400,000 years.

TELEGRAPHIC INDUCTION.—The earth currents are at times accountable for the unpleasant noises heard in the telephone but usually ascribed to induction. Being alternating currents, or at any rate not constant in direction, and of slight duration and intensity, an exceedingly delicate ballistic magnetometer is desired for their measurement. More definite knowledge on this subject, says *Modern Light and Heat*, is likely to lead to the perfection, at least for war purposes, of telegraphing under certain conditions between any two points not far distant on land or sea without connecting wires.

GOOD HEALTH.

Petroleum as a Medicine.

It is a matter of surprise that the medical profession has not given more investigation and publicity to the virtues of native petroleum as a remedial agent in many diseases. Common coal oil has cured many acute cases of inflammatory rheumatism, just by rubbing it on the parts affected. Incipient consumption has been cured by taking the *native* petroleum internally. The writer knows of one case where the disease was so far advanced that the voice had lost power to speak above a whisper, and his voice was fully recovered, and his body was restored from its emaciation. The oil he used was pure native West Virginia natural oil of 29 gravity—a lubricating grade. He used about one gallon in doses of a teaspoonful, and was restored to robust health. It has also proved beneficial in dyspepsia. The oil-well borers are constant tasters of crude oil, and say it gives them perfect digestion and operates as a mild laxative.

Care must be exercised in procuring the right quality. Pure native petroleum of a gravity of 29 to 30° is the proper kind to use, and it cannot be obtained short of West Virginia. All the oils in market called "West Virginia" are manufactured in the still and are unfit for internal use. California oil contains asphaltum, and is unfit to use.

Dr. Blache states in the *Bulletin de Therapeutique*, that a refiner of petroleum, having been prohibited by a prefet the distribution of petroleum in medicinal doses, the fact led to an inquiry being made as to its alleged utility in affections of the chest. The native petroleum from Pennsylvania and Virginia was that experimented upon first. It is a very safe substance, for even large quantities, when drank by error; and in such cases has caused only a little nausea. In chronic bronchitis, with abundant expectoration, it rapidly diminishes the amount of the secretion and the paroxysms of coughing, and in simple bronchitis rapid amelioration has been obtained. Its employment in phthisis has been continued for too short a time as yet to allow of any opinion being delivered as to its efficacy, beyond that it diminishes the expectoration, which also loses its purulent character. The petroleum is popularly taken in doses of a teaspoonful before each meal, and after the first day any nausea which it may excite in some persons, disappears. M. Gardy, a Paris druggist, has prepared capsules, each containing 25 centigrammes of petroleum, or, as he calls it, *huile de Gabion*, from the name of an ancient petroleum spring, and this Dr. Blache considers as the most favorable mode of administering it.

THE SCIENCE OF DIGESTION is just now being discussed in the English papers in a light quite different from the generally accepted theories in this country, as may be seen from the following which we clip from London *Iron:* The fallacy of "plain living" has long been exploded, and it has been proven that the stomach never performs its duty so effectually as when called upon to act upon a variety of food, provided, of course, that the food is well cooked. The popular opinion now is that a dinner consisting of three or four varieties of solid food is more easily digested than the meal which is confined to one sort only. The old fashioned notion of a single joint and a simply-made pudding is pronounced to be a fruitful source of indigestion. On this subject Dr. Geo. H. Taylor says in the *Sanitary News:* "Ready digested and easily digested foods are the abomination of dietetics; they prevent normal incitation of the digestive organs, necessary for normal secretions; they encourage a false notion that nutrition can be assured without reference to expenditure or to providing any use for nutritive material, and thus are liable to cause unnatural, irregular, unmanageable increase of the unstable ingredients of the organism, which react injuriously upon the digestive secretions, especially those of the liver. The prevalent recourse to these presumably enforced methods of nutrition are, in short, a violent and abnormal reaction against the former prevalent reign of physic, depletents and so-called alteratives. These old methods actually provide modes of disposing of unused nutritive supplies, although they be morbid modes."

THE CURE FOR HEART NEURALGIA.—Angina pectoris (agony of the chest) carries off many people, one of whom, according to the newspapers, was the novelist, the Rev. E. P. Roe, who expired in one day because of its crushing anguish. Major-General George B. McClellan, according to the published reports of that time, likewise succumbed after 24 hours of uncontrollable pain. Just how these patients were treated I am unable to say, but Dr. Richardson of London, long before General McClellan's death, had received a prize of 25,000 francs from the Academy of Medicine in Paris for having discovered an almost infallible remedy for angina pectoris by the administration, in small doses of 1 100 to 1-25 of a grain, of nitro-glycerine! This discovery entitles Dr. Richardson to the never-ending gratitude of every suffering man, woman or child afflicted with angina pectoris. I know a number of persons who always carry tablets of nitro-glycerine with them, and I am equally certain that all these people, by the use of nitro-glycerine, are living in comparative comfort, who would otherwise have fallen under the insupportable torture of that form of heart neuralgia, the most dreadful of all pains.—*N. Y. Graphic.*

YELLOW-FEVER GERMS.—In our last issue mention was made of the character and appearance of the yellow-fever germs. Since then we have learned that Prof. H. J. Ditmer of the Ohio State University has succeeded in photographing the germs as found in the human tissue. His description of them is much the same as given in our last issue. We quote from the N. Y. *Sun* as follows: The bacilli present themselves in four forms: The first is a plain, dark, round mass; the second, an oval, with a dark point at each extremity; the third an oblong disk, with dark points, as in the second; and the fourth, two dark points united by a film and strikingly resembling a dumb-bell. The professor says: "Dr. Sternberg of Johns Hopkins University for a number of years has made exhaustive search for yellow-fever germs, but without success, in the tissues. During the last epidemic he made several post-mortem examinations at Decatur, Ala. Liver and kidney tissue of two persons, at least, were sent by him to Dr. Reeves for the purpose of mounting for microscopical purposes. I have several negatives, each of which is good. Some show the bacteria singly, others in masses, with the capillaries distended with them."

DANGER TO LIFE.—If there be any possible danger to life and property that cannot be overcome by man's ingenuity, it has yet to show itself. The deadly elevator has at last been rendered innocuous by means of an air cushion. If it breaks loose at the tenth story, or the fifth, it is received on this cushion so safely that no harm can be done. The *Scientific American* tells of an experiment where an elevator, weighing 2300 pounds, equipped with plate-glass mirrors and loaded with baskets of eggs and goblets, was cut loose and allowed to shoot down 80 feet. The air-cushion received the elevator with so much ease that not a drop of water was spilled or an egg broken. The pressure at the point of concussion was 60,000 pounds.

THE DIPHTHERIA MICROBE.—The *Figaro* says the professors connected with the Pasteur institute have succeeded in identifying the generative microbe in diphtheria. The discovery in a preventive form of a vaccine virus is expected.

CITY AND COUNTY BRED FOR ENDURANCE.—It is stated that during our civil war city-bred men stood long marches better, were subject to less disorders, and recovered from gun-shot wounds more readily than country-bred men.

THE EYE.—It is said that a fatigued eye recovers last the perception of the color by which the fatigue has been induced, and first recovers the sensitiveness of the complementary color.

USEFUL INFORMATION.

TIMBER FRAUDS CASES IN THE UNITED STATES SUPREME COURT.—Washington dispatches state that on the 4th instant the Supreme Court set aside the order denying the motion to advance the cases of the United States against Geo. H. Perrin, M. F Riley and John D. Hall, and assigned the cases for hearing the third Monday in March. These cases were appealed from the Circuit Court for the District of California on a certificate of that court. The reasons urged by the Attorney-General for an advancement are: 1st, That in certain localities of the United States a large number of cases have arisen wherein fraudulent conspiracies were entered into, in which parties concerned are alleged to have conspired to obtain contracts for the surveying of public lands; that without making any actual survey of lands according to law, they made up false, fictitious and fraudulent pay vouchers and received money thereon from the United States. 2d—Prosecutions were instituted against some of the alleged conspirators, and the three cases of this class are now pending on the decision or opinions in this court involving the same general character of questions. 3d—That 23 civil suits have been brought against parties to such conspiracies, and among others against defendants in this indictment, and the court wherein civil suits are pending declines to try the civil cases until this and other like criminal cases shall have been disposed of. 4th—That the amount claimed by the Government in this class of civil cases now pending amounts in the aggregate to $564,247 20. 5th—That there is reason to believe that if the trial of cases be delayed, much of the evidence on which the Government relies will be lost.

DRAPERY GLASS.—*Scribners' Monthly* for December contains an article on the uses to which this glass has been put, the writer claiming that our artists and decorators are now producing effects in stained glass windows far superior to the best work of European artists. He describes part of the process of manufacturing drapery glass as follows: "This is made from the glass as it is thrown in a melted state upon a flat table of iron to be rolled into a disk. When the glass is spread out, very much like piecrust, the roller by which it is spread keeping up the resemblance, the edges are seized by the glassmaker, armed with short tongs, who overlaps an edge or pulls and twists it in various directions as his fancy may suggest. This glass, when annealed and cooled, reveals in great variety the flow and twist of folds of drapery, and when the artist-artisan, with the main direction of the lines of the draperies of the cartoon which he is following firmly fixed in his mind, visits the racks in which, row upon row, the disks of glass are stored, he is generally able to select pieces which, placed in the window, represent in the color of the glass, unaided by the painter's skill, the most subtle gradations of light and shade in the form of the drapery."

IMPROVEMENT IN UMBRELLAS.—Two improvements in umbrella-making have recently been patented. The first is in the frame, where the "git," which holds the stretcher to the rib, is now being made of hardened and tempered steel instead of soft iron, while at the same time the fork end of the stretcher, by which it is connected with the rib, is narrowed somewhat, the result being that when the umbrella is folded it is practically impossible to distinguish any "knee," and at the same time a stronger joint is formed. These new frames are not only very light but very durable. The second improvement is in the ferule, where a hard india-rubber tip has been introduced with the effect of saving the frame from jarring, and at the same time rendering the umbrella noiseless when used for a walking-stick.

LOCOMOTIVE AND OTHER BOILERS.—*Mechanical Progress*, an English publication, says that in the United States there are more locomotive boilers than any other single class, and in one monthly report of explosions we find that only two of this class of boiler exploded, while during the same period there were no less than eight explosions of sawmill boilers. In the latter case 13 persons were killed and 11 seriously injured. It there were really thorough means of obtaining statistics of the number of people annually killed and wounded by boilers run by incompetent men, the list would show a most appalling record of suffering and death.

IMMIGRATION.—More than half a million immigrants from Europe arrived last year at the five landing ports of the United States, considerably exceeding the figures of 1887. By the laxity of the immigration laws a very large proportion of the immigrants belong to the criminal and pauper classes, against which honest labor is making a determined opposition. Capital, too, is finding that murderous hordes, while they cheapen labor, are expensive in other directions.

TO STOP A CHIMNEY FIRE.—Zinc, placed upon the fire in a stove or grate, is said to operate as an effective extinguisher of chimney fires. According to this representation, when a fire starts inside a chimney, from whatever cause, a piece of thin sheet zinc, about four inches square, is to be put in the stove or grate connecting with the chimney. The zinc fuses and liberates aciduous fumes, which, passing up the flue, are said to almost instantly put out whatever fire there may be.

TO KEEP SOOT FROM THE CHIMNEY.—To prepare soft coal in such a way, at small cost, that there will be no accumulation of soot in the chimney, and that the under side of the stove lids will be kept clean and nice all the time, and the good wife's objections to the use of "nasty coal" will be removed: For a ton of coal, buy about 15 cents worth of common salt, make a brine of it, and pour it over the coal. So says an exchange.

TO KEEP THE BIRDS FROM FRUIT.—Pans of water placed in fruit and berry patches will keep birds from eating the fruit. An English naturalist claims that the reason birds eat cherries and strawberries is because in the blazing heat they get dreadfully thirsty. If the birds can easily get at water, they soon leave off taking the fruit. The experiment is certainly worth trying.

KNEW HIM TOO WELL.—At one of the crossroads in Brazil, an idol carved from the wood of an orange tree was placed for the Indians to worship. On one occasion it was noticed that an old redman omitted to perform his act of obeisance. On being commanded to kneel he stubbornly replied: "No; I knew him when he was an orange tree."

PENCILS FOR GLASS AND METALS.—The new pencils introduced by Faber for writing upon glass, porcelain and metals, in red, white and blue, are made by melting together four parts of spermaceti, three parts tallow and two parts wax, this mixture being colored with white lead, red lead or Prussian blue, as desired.

NATIVE AFRICAN M. D.'S.—Two of the young African natives whom Cardinal Lavigerie sent to Lille, there to study medicine, have just obtained their degree of M. D., after passing their examination in a brilliant manner. Their names are Frederick Mahomed and Vital Hamed.

STOVES.—It is now just about 50 years since stoves—cooking and heating—first began to be generally used. That was when Americans began to make stoves for the home market.

A SCREW which is half nail is a new invention. Its holding power in white pine, they say, is 333 pounds against the 298 pounds of the present screw.

ENGINEERING NOTES.

THE ENGLISH CHANNEL TUNNEL.—We clip the following from London *Iron:* It is stated that, notwithstanding the threatened opposition of the Government, the Channel Tunnel Company will proceed with the bill which it proposes to bring before Parliament and take a division upon next session. It is said that since last year the promoters have received great encouragement to proceed, particularly from a large number of persons connected with the manufacturing and commercial centers of England and Scotland. They have also, we are assured, in many cases been promised the support of several members of Parliament. The machinery which was used for boring the tunnel is still in the heading, and is periodically set in motion to keep it in order; but no attempt is made to advance the heading, the length of which measures about 2100 yards. It is now two years since the works were stopped, and the tunnel is said to be so far impervious to water that on an average not more than 400 gallons has found its way into the entire heading in the course of 24 hours. The boring operations for coal near the mouth of the tunnel still continue, and a depth of about 1000 feet has now been attained. The character of the strata is such as to encourage the continuation of the operations in the hope of ultimately finding coal. While the prosecution of the borings for coal ought to be encouraged in every way, the same cannot be recommended for the tunnel works, for, in the present state of public opinion, the money spent that way will only be wasted.

RAILWAYS IN ASIA.—The railway is becoming an important instrument in modern civilization. It is making rapid inroads into the ancient methods, customs, and industries of Asia. Japan is becoming very rapidly revolutionized, and is introducing this method of transport and travel with great enthusiasm. Southern, Central and Northern Asia is also being rapidly opened up to commerce by the pushing energy of England and Russia. The same may be said of Persia. The great Empire of China, however, still clings to her ancient policy of non-intercourse so far as possible. But she is beginning to gradually yield to the inevitable. The latest scheme of this kind is the building of a railway from Tien-Tsin, China, 81 miles into the interior, with the probability of its early extension to within 15 miles of the capital of the Empire. The consummation of a work of this character is of the utmost importance to the future development of Chinese internal and external commerce. It is a significant sign of a radical change in the imperial policy affecting the industrial growth of the country. A pioneer railroad extending 81 miles from a commercial port toward the interior, means thousands of miles of railroads throughout the Empire within not many years. Already, it is reported, the road has become popular with the Chinese people, and that is all that is needed, under good management, to make it a paying investment.

THE PANAMA CANAL.—The dissolution of the old Panama Canal Company has been decreed on the petition of parties acting in accord with De Lesseps. The court appointed Brunet official liquidator. The application for the dissolution was made by two directors of the company. The tribunal authorizes the dissolution of the old company as preliminary to the formation of the new company. The liquidator appointed by the court is given full power to dispose of the property to the best interest of the company. The public feeling in Paris regarding the chances of the new company is one of very great despondence. De Lesseps, in an interview, said that if all the 60,000 bonds issued through the Banque Parisienne are not taken the enterprise must be abandoned, and a foreign nation would for a morsel of bread get the gigantic work, which was nearly finished, and upon which French investors had invested their millions. The canal would be completed, but neither by nor for the French. At this writing not one-quarter of the bonds have been taken, and there is little hope that any considerable increase of subscription will be realized.

A GRAND SCHEME NIPPED IN THE BUD.—A grand scheme was recently started having for its object the improvement of the navigation of the Allegheny river. The plan was to construct a canal from near Niagara Falls across the country to French creek, through which stream a sufficient quantity of water was to have been obtained to be emptied into the Allegheny river so as to make it navigable. According to a rough estimate, this work was to cost $12,000,000. The scheme appears to have been quite thoroughly talked up before any engineer was put upon the ground. When that was done, however, the report came that the Allegheny was considerably higher than the Niagara river, and consequently if a canal was cut through as proposed there would be a rush of water in the opposite direction. The Allegheny would be *drained* and not *filled*.

THE LARGEST VAULT.—The United States possesses the largest vault and the largest deposit of money in it of any Government in the world. It can hold $100,000,000, but the prospects are favorable for a call for increased storage of silver. There are about $20,000,000 in half dollars that do not budge.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—Amador *Ledger*, Feb. 9: This mine claims the palm in having yielded a larger amount of gold last month than any mine in the county. We are not able to give the exact amount of the cleanup, but should judge it was in the neighborhood of $30,000. The mill is kept running principally on small seams of rich quartz. A large quantity of rich ore has accumulated on the dump, in consequence of which a number of miners were laid off this week until the dump-pile is reduced.

MISCELLANEOUS.—A cleanup at the Alice mine, above Big Bar bridge, owned by Messrs. Petrie, Tripp & Littlefield, was made recently, which yielded very satisfactorily. We are told the rock gave a clear profit of between $2 and $3 per ton. We learn with regret that the Keystone mill is to be closed down soon. The rock has not been of a paying grade lately. Some extensive prospecting will be done.

BELL WETHER.—*Dispatch*, Feb. 9: They have encountered a ledge of good-looking ore on this prospect. A contract has been let by Mr. Bright to run a tunnel 100 feet on the ledge.

COSMOPOLITAN.—East crosscut in 210 feet, face in hard slate; west crosscut in 90 feet, face in hard slate. There are about 30 men on the pay-roll.

GOVER.—The Gover mill closed down on Monday, so as to connect the hoisting-works with the new pipe.

OVERPLUS.—There are two men at work on this property taking out ore. The mill is closed down at present.

Calaveras.

A BONANZA.—Angels *Echo*, Feb. 9: Considerable talk has been going the rounds in this section during the past week regarding the discovery of an immense bonanza in the Nevills mine in this town. We visited the mine last Monday and inspected the 400-foot level where the reported bonanza was said to have been discovered. The ore bodies just discovered were found east of the old vein. What was supposed to have been the hanging-wall of the old vein, has proved to be only a stratum of slate about ten feet wide. The running of a crosscut has developed a new vein of quartz about 15 feet in width, when another stratum of slate, seemingly a hanging-wall, was found. The crosscut was extended through this supposed wall, which also proved to be a stratum of slate, eight feet in width, when another immense vein was tapped. The crosscut has been run into this latter vein a distance of 21 feet and the hanging-wall has not been reached yet; consequently the exact width of the ledge is not known. The ore is of a higher grade than any heretofore found in this mine. The newly discovered ledge has every indication of being the main lode. Quite a stream of water courses along the vein, something never known in this mine before, the ore heretofore mined being perfectly dry. If you could call the old vein a mine, the new discovery constitutes a greater one, consequently there are two mines in one. The crosscut that has tapped the bonanza was run on the 400-foot level and 122 feet south of the shaft. A few months ago preparations were made to sink the shaft deeper, the opinions of the owners being that the ore was about exhausted above the 400-foot level, but the new discovery will now obviate the necessity of sinking for many months to come. A new crosscut was started Monday, which is being run eastward from the shaft to tap the new veins, and through which the ore can be transported to the cage to better advantage as soon as stoping commences.

MINE FLOODED.—*Mountain Echo*, Feb. 9: Water from the old works at the Angels mine broke into the new works last Sunday evening, flooding the mine up to the 200-foot level. The miners hurried out, and luckily nobody was hurt. The mine is now being drained as rapidly as circumstances will permit.

HALF-INTEREST SOLD.—*Chronicle*, 9: A half interest in the Voght gravel claim, situated on the Amador side of the Mokelumne river, about three miles from this place, has been sold to Messrs. Louis Blanding and D. J. Leggett. This mine is well supplied with machinery and has been in operation for nearly three years. The new partners are men of means as well as of practical experience in mining operations, and intend to push operations vigorously. They are engaged in sinking.

El Dorado.

TUNNEL.—Georgetown *Gazette*, Feb. 10: A new tunnel has been started on the Hog's Back mine, about 100 feet deeper than the old one, and will be about 1700 feet in length. It has been shown that the bed of the ancient river in that locality is covered with a deposit of cement and other material to a depth of from 400 to 500 feet.

Lake.

GOLD.—Lake Co. *Avalanche*, Feb. 6: We have seen some fine specimens of flake gold that were found in the mountains of Lake county, and the gentleman who made the discovery is of the opinion that if water was to be had near, it would pay to work. The same gentleman also had some specimens of quartz, which came from the same vicinity, that had every evidence of bearing gold. Now we are no sensationalist, but we are confident that where such fine specimens of gold exist there is a possibility if not a probability of there being more and in paying quantities. Why should not a company be formed to put a few good prospectors into the field and see what we have here in Lake county in the way of metals?

Mariposa.

VIRGINIA.—Mariposa *Gazette*, Feb. 9: The Virginia mine is running the pump and taking the water out of the shaft, and the hoisting-works are nearly ready for use.

Nevada.

WILLOW VALLEY MINES.—*Transcript*, Feb. 10: The mining outlook in Willow Valley district, this township, was never brighter than it now is. At the Neversweat four men are working steadily. They have now on the dump 40 tons of ore taken from a point 280 feet down on the ledge and 40 feet below the drain tunnel, which is in 1400 feet and taps the incline which is down over 300 feet. The work is being done through the tunnel. The last cleanup of the Neversweat paid at the rate of about $80 per ton in free gold for the general run of ore, and 3 tons of sulphurets therefrom gave $260 a ton. Nine tons of picked ore yielded $300 a ton. The ledge is of good size and well defined. Edward Gagan's claim, near Harry Striker's cabin and just this side of the Deadwood mill, is doing well. Two men took between $3000 and $4000 from it last year. Leander Ragon and Wm. Meyers are sinking a new incline on the Constitution and have a fair prospect. The Lecompton is being worked through a tunnel and a winze by Messrs. Ciemo and Harris of Gold Flat, who have a two years' lease. They recently had a crushing of ten tons which paid well, the sulphuret ore giving $206 a ton. The five Ebaugh brothers have relocated the Beach claim near the Neversweat and are engaged in driving a tunnel for the ledge which they expect to reach within a week. S. S. Luey and Joe Kitts are getting out timbers preparatory to again starting up work on the Jackson. This mine has produced considerable gold in past years.

YIELDING.—*Tidings*, Feb. 6: The Washington, Eagle Bird and Yuba mines of Washington township are yielding remuneratively. The water in the Blue Bell is about "forked," and explorations will soon be started.

Shasta.

CHROME.—Shasta *Democrat*, Feb. 6: That tin ore discovery we reported last week turned out to be chrome iron. The Calumet mill at Middle creek is shut down for a few days, undergoing repairs. The Calumet M. Co. has bought the Poorman mine, in Buckeye district, and has commenced opening it up. The new mortar for the Wheeler mill on Kline gulch has been placed in position and the mill is now running again. The Huntington mill on the Ten Eick brothers' mine on Spring creek has been running for ten days past on good ore. This mine is developing handsomely. Ore was exposed lately that is exceedingly rich in ochre sulphurets and free gold specimens. Another rich strike is reported to have been made lately on a gulch tributary to Dog creek, which has so far yielded several hundred pounds of specimens. R. G. Dunn, Mr. Brastow and Mr. Hall, all Wells, Fargo & Co. officials, are developing another good prospect on Nigger Hill. Mr. Ironsides, an old Nevada miner, is prosecuting the work and thinks the prospect will develop into a good mine. The ore in the discovery shaft, now down 15 feet, prospects well in a mortar.

MINING NOTES.—*Democrat*, Feb. 13: Mr. Butters has bought up all the tailings of the Texas, Central and Mammoth mines, and is shipping them to his mill at Kennett. The Walker mill is shut down on account of scarcity of water. The owners are talking of putting in pumping machinery to get a supply from the river. The Lucky Bart mine on Stacy gulch is probably the richest find ever made in the county. The shaft is now down 41 feet on a six-foot ledge.

Sierra.

THE MARGUERITE.—Sierra *Tribune*, Feb. 8: The Marguerite mine has at last adopted a sure way of overcoming the great trouble that has heretofore prevented successful working. A contract has been made with Knight of Sutter Creek, Amador county, to put in two of the Knight pumps (not Cornish pumps). They will be 17-inch pumps, and will be driven by Knight's hydraulic engine, with a pressure of 356 feet. This machinery is highly recommended by William Johns. The pumps are guaranteed to throw 50 miners' inches of water 1000 feet high; or in other words, hand the water out of the mine 1000 feet deep. A good deal of money has been taken out of this mine, and large sums have been taken from the stockholders' pockets. There are three levels worked out, and the fourth is sunk, only awaiting the miner's pick to bring to the surface the precious metal. Each of the three levels has produced $200,000. The present pay chute so far as opened is 540 feet. In the face of the tunnel west on the fourth level is a good-paying ledge. The company agreed to buy the Italian ditch, which has 800 inches of water in the driest season.

THE SACRED MOUNT.—Four men are running a tunnel at the claim. The main tunnel is in about 200 feet. A ledge three feet wide can be seen in the face of the drift. Assays of rock from the ledge give $24 a ton in free gold and $168 in sulphurets. It is the intention of the company to have work continued during the winter months.

JANUARY CLEANUP.—The Sierra Buttes Co. made a cleanup of $20,000 as a result of their work for January.

OXFORD.—*Mountain Messenger*, Feb. 9: The Oxford quartz mine continues to improve, the rock getting better as the tunnel progresses. They have already developed a chimney about 100 feet long, and the end is not yet. J. W. Pearson of Forest City has discovered some very rich gravel on Kanaka creek, taking out four ounces of gold in one day. Campbell & Shepherd have located some ground adjoining.

YOUNG AMERICA.—The cleanup of the Young America Co., Sierra City, for January was $27,200, and a dividend for the past month has been declared of $10,000. Total dividends to date, $370,000. The ledge is now fairly opened again, and prospects are good for large and steady dividends.

GOLD.—A man by the name of Adams has found some very rich rock at St. Charles Hill. He has already taken out considerable gold with a small mortar. Mr. Rouse, who has been operating in that vicinity for some time, has secured a bond upon the claim, and intends to put a mill upon it as soon as it is possible to do so.

GRAVEL.—Wm. Morse came over from Port Wine, Tuesday, and reported very little snow there. Between 30 and 40 men are employed at Happy Hollow, and good pay gravel is being taken out of the Union Consolidated drift claim, and also from the Riffle at Grass Flat.

TUNNEL.—A tunnel has been started by Oscar Jones, R. P. Mott, and others, to develop some ground lying along the North Fork, on the Bald Mountain ground. It was too low to be worked through the old Bald Mountain tunnel.

THE SIERRA BUTTES people think they have found a new and rich quartz ledge in No. 2 tunnel. The report is that the Rainbow Co. has found some very good rock in their lower tunnel on Kanaka creek.

CLEANUPS.—It is reported that the Buffalo mine in Hog canyon has made several good cleanups, and that one or two more will put the company out of debt.

THE RUBY CO. has resumed work after being compelled to suspend for a time because the water was frozen up and they could get no air.

San Diego.

OWENS.—Julian *Sentinel*, Feb. 6: Things have been quite lively at the Owens mine this week. Men are at work retimbering the old shaft, and are making good progress. Prospectors have struck a rich lead on the hill above the hoisting-works, and the ore prospects $20 a ton. A new blacksmith and carpenter-shop has been built, and things are beginning to assume a business-like appearance once more. Work will be begun on the new shaft as soon as enough timbers are sawed to make a start.

NEVADA.

Washoe District.

BEST AND BELCHER.—Virginia *Enterprise*, Feb. 9: The north drift from east crosscut No. 2, 350 level, is still in a mixture of quartz, clay and porphyry. Quartz carrying metal is being encountered in No. 1 crosscut west. No. 2 west crosscut is still in vein material

HALE AND NORCROSS.—On the 400 level, in the north lateral drift, at a point 95 feet north of the west drift, have started west crosscut No. 1 to encounter the upward extension of the 500 level ore body. This crosscut is now extended 69 feet. On the 500 level the north drift has been advanced 20 feet; total distance, 169 feet. This drift is still in good ore. The stopes above this drift continue to yield ore of good quality. Since last report have hoisted 1825 tons of ore, shipped to the Mexican mill 1697 tons and reduced 1717 tons. Average battery assays, $21 per ton. A shipment of $4641.53 in bullion has been made, making the total so far for the month $58,350.

CON. CAL. AND VIRGINIA.—Work is in progress on all the levels from the 1400 to the 1750. The south drift from the winze below the 1465 level is yielding much good ore. On the 1650 level in east crosscut No. 2 from the main north drift from the Con. Va. shaft, east of upraise No. 3, are stoping ore of good quality. The stopes on the seventh and eleventh floors of this level are showing ore of fair quality. The north drift from the bottom of 60-foot winze is in material of some value. About the usual amount of ore is being shipped to river mills and the average of battery assays will be about the same as last week.

SAVAGE.—On the 400 level No. 1 southwest crosscut on the south boundary has encountered two feet of good ore in the face of this crosscut, and have turned the drift north following this ore. This drift is now advanced 27 feet and continues in ore of good quality. From the north and south drifts on this level are extracting ore, and from the old stopes. Have hoisted 617 tons of ore, shipped to the Rock Point mill 782 tons and milled 848 tons. Average battery assays, $21.39 per ton. Bullion shipped and on hand, $25,647.

CONFIDENCE.—All the ore stopes are still looking well, and 450 tons a week are being shipped to the Brunswick mill, which is running 32 stamps. A shipment of nine bars of bullion, valued at $25,219.63, has been received from the mine at the Bay this week, being the final shipment on January account, during which time there was produced $89,321.96.

OVERMAN.—Have run the mine six days during the past week. Extracted 296 tons and 1600 pounds of ore. Shipped to the Vivian mill 236 tons and 1600 pounds of ore.

CHOLLAR.—Are shipping about 150 tons of ore a week to the Brunswick mill. On the 300 level the north drift continues in vein material of a favorable appearance.

YELLOW JACKET.—The accident to the spur-wheel has interfered with underground operations during the week, but all will next week be running as usual.

UNION CON. AND MEXICAN.—On the 1465 level a joint Union north drift started from the east drift from the Ophir is advanced 501 feet in Mexican ground.

CHOLLAR.—The prospecting drifts on the 550, 650 and 750 levels are still in favorable vein material. The Nevada mill is crushing the usual amount of ore.

OCCIDENTAL.—Ore is being extracted from the 300, 450 and 550 levels; also from the west crosscut from the winze down from the main tunnel.

POTOSI.—The exploring drifts on the 650, 750 and 850 levels continue in the same vein porphyry mentioned last week.

NORTH OCCIDENTAL.—Vein material carrying metal is encountered in the drifts on both the 220 and 400 levels.

IMPERIAL.—Good headway is making in No. 2 east crosscut on the 110 level. No change of material to report.

JUSTICE.—The ore-producing sections of the mine continue to look well. The mill is kept in constant operation.

SEG. BELCHER.—Are drifting east from the end of the 1100 level south drift to connect with the 1300 raise.

GOULD AND CURRY.—The southwest crosscut on the 450 level is still in a mixture of quartz, clay and porphyry.

BALTIMORE.—During the week an important development has been made well out west on the 300 level.

SIERRA NEVADA.—The east crosscut from the south drift is still in material that carries some metal.

ALTA.—All is working well in the mill and the stopes yield the usual quantity and quality of ore.

SILVER HILL.—Opening and timbering a station at the 160 level. Shaft cleaned out to 400 level.

OPHIR.—The south drift from the bottom of the winze on the 1300 level is still showing value.

ANDES.—The work of cleaning out and repairing drifts on the 175 level is progressing favorably.

BELCHER.—On the 200 level the north drift from the shaft is out 463 feet. No change of material. Have cleaned out and repaired 156 feet of the old 1100 north drift and have advanced the 1100 south drift 50 feet. This has now been turned and run east 45 feet, when a winze will be sunk 45 feet to connect with the Seg. Belcher and Mides raise.

NEW YORK.—The face of the north drift on the 800 level is in a favorable vein material.

UTAH.—The main south drift on the 600 level is in vein material carrying metal.

SCORPION.—The usual progress is making in the crosscut on the 300 level.

CROWN POINT.—On the 800 level No. 2 crosscut is out 76 feet.

BENTON.—Will soon have a hoisting plant of their own.

Cherry Creek District.

THE STAR.—Tuscarora *Times-Review*, Feb. 6: Several prominent mining men of San Francisco have recently visited Cherry Creek, and it is thought that a strong company will be formed shortly to work the Star on a larger scale.

Santa Fe District.

COPPER.—Esmeralda *News*, Feb. 9: A. E. Dick a New York mining man, who has been experting on copper mines in this county in the interest of New York capitalists, last week succeeded in purchasing a group of mines in Santa Fe district. The mines were purchased from B. W. McClane, Eli Johnson, J. W. Hogan, and J. Fagen, and, so far as can be learned, there was something like $20,000 changed hands on the transaction. This sale has been the means of creating a considerable amount of interest in copper mining in our county, and a number of prospectors, who own copper locations, have been induced to resume work on the mines that were heretofore considered useless. From an interview with one of the gentlemen immediately interested a *News* reporter gleaned the following facts concerning the intentions of the copper men: They intend to purchase all the copper mines that have been developed to any extent, and where owners will not sell, they will purchase from or work the ore for them. On or about the first of March next the work of erecting a furnace will be commenced. The site for the furnace has not as yet been definitely decided upon, but from present indications it will be located at a point near the line of the C. & C. railroad and about seven miles south of Luning. The furnace will be of water jacket pattern and of thirty tons capacity. The company has secured the water right and every arrangement has been made to begin operations immediately. The erection of the furnace, whether in Hawthorne or elsewhere in the county, will have a decidedly beneficial effect; it will create a stir and encourage prospecting, for when a person does discover a mine he will know that the facilities for working the ore are at hand. The copper mines of this section have almost been a dead letter of late years. It is claimed that on the several dumps of the property recently purchased there are now about 3000 tons of good ore, and that the mines are in such shape that 100 men could be put to work immediately extracting ore.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Feb. 8: South drift from the east crosscut, 250-foot level, extended 10 feet.

COMMONWEALTH.—Shaft has been repaired, timbered 25 feet, and is in good running order. 100-foot level: No. 2 east crosscut from main south drift has been advanced 12 feet; some low-grade ore is showing in the face. Intermediate drift from No. 4 chute has been extended five feet, still exposing good ore; car samples average assay $240 per ton. Drift from top of No. 8 chute, being run to connect with the intermediate drift, has been extended nine feet in high-grade ore.

GRAND PRIZE.—300-foot level—Drifts have been started east, on the hanging and footwall veins, from the south crosscut; the former extended seven feet, showing bunches of good ore, both yielding concentrating ore. 400 foot level—North crosscut has reached the west vein. Connection has also been made with the winze from the 300-foot level on the east side of crosscut. The vein is three feet wide, two feet of which is high-grade ore.

NORTH BELLE ISLE.—Intermediate drift south from No. 1 winze, below the 300-foot level, extended five feet. Ore continues about same grade. No. 1 winze, 400-foot level, extended 14 feet in favorable-looking rock.

NAVAJO.—The crosscut from the south drift, 350-foot level, extended 16 feet and is passing through favorable-looking ground. The stopes are looking well and have yielded the usual quantity and grade of ore.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—The Combination shaft has been sunk and timbered 21 feet; total depth, 140 feet. The formation looks very favorable for ore.

NEVADA QUEEN.—Work at the concentrator is progressing favorably. Will start up again Monday, when everything will be in good shape to run steady.

FOUND TREASURE.—Prospect shaft has been sunk 10 feet, and is passing through stringers of good chloride ore.

Wild Rose District.

THE PARADISE MINES.—*Silver State*, Feb. 6: From Supt. McCurdy, of the Paradise Valley Mining Co., we learn the following relative to the ore body in the Wild Goose mine. In drifting north on what is called the 70-foot level, that is, 70 feet above the upper tunnel, and 280 feet below the surface, and 30 feet north of the large chimney of ore which has been worked for the past five years, the new chimney of ore was found. The ore as taken out will average about $100 to the ton and runs high in gold. The drift is in 28 feet on the ore body. The vein on the face is about seven feet wide, and there is quartz in the foot-wall which has not been cut in drifting, that may still further increase the width of the vein. The south ore body above the upper tunnel is looking well, and the ore is of a good grade and mills higher than was expected. Altogether the outlook is very promising. The mill is now running and regular shipments of concentrations will be made.

ARIZONA.

MOHAVE CO.—*Miner*, Feb. 9: Marshal and Jamison are at work on the Pixley mine, Layne Springs, taking out some good ore. John K.

Mackenzie shipped a four-ton lot of ore from the Prince George South. There were 75 tons of high-grade ore from the C. O. D. mine worked at the sampler during January. MacDuffee, Heimrod & Uncapher are at work on the Connor South, and getting some fair shipping ore. Kelley & McKinnon have encountered another body of good ore in the north end of the Connor mine, which promises to exceed in value anything they have found. Now that the weather has moderated and the roads are again in good condition, we may expect the arrival of considerable ore during the next ten days, there being numerous small lots at the various camps. The machinery for a complete 10-stamp gold-mill, to be erected on the Rattan mine, was purchased by Supt. Brother during his recent visit to S. F. John Mulligan departed for the New London on Wednesday for the purpose of prosecuting work on the south extension of that mine. John has discovered some extremely high-grade ore. The contract of driving the main tunnel of the Nighthawk mine is completed, and a fine body of ore opened up. Supt. Bowers is preparing to work the mine on a more extensive scale than ever before. Reports from the recent strike at Wallapai Springs made by Mr. Cummings show that property to be considerably richer than at first reported. The pay streak is from 18 to 24 inches wide, and by returns from the sampler works 150 ounces silver per ton, while the assorted ore ran up to 575 ounces silver per ton. The Arizona Sampling Works have been quite busy during the week. Among the ores sampled we notice the following local lots: Rogers Bros., 40 tons of lead ore from the Schoolkyll, Chloride; C. O. D., 30 tons; D. W. Grant, two lots from the Juno, Chloride; Chas. Cummings, 12 tons from Wallapai Springs; Joe Prisk, a small lot from Mineral Park; Jose Canyas, 4 tons; Darden & Shippe, small lot; Mulligan Bros., 2½ tons lead ore from the New London; while there are awaiting treatment at the sampler the following lots: Two carloads from the C. O. D.; one carload from W. W. Clack, lessee at the C O D.; one carload from the Cupel; and about 4 tons from the Prince George South.

HARQUA HALA.—Silver City *Enterprise*, Feb. 8: A representative of the *Enterprise* during the week had the pleasure of interviewing L. A. Snyder, a mining man of extended experience, and one whose opinion on mining matters is entitled to respect and careful consideration. Mr. Snyder has just returned from the new strike, and furnishes our readers with the following information: "The district is not a new one, and there are several shafts ranging from 10 to 60 feet in depth, and within six miles of the strike is a ten-stamp mill. The strike itself, known as the Gold Mountain, is a contact vein of extremely well-defined proportions for the amount of development. The formation in which the vein occurs is quartzite and porphyry, the latter forming the foot-wall of the contact, and dips to the east at an angle approximating 15 degrees from the horizontal. The shaft or pit is only five feet deep, and discloses a vein of ore varying from 2 to 3 feet, and has a milling value approximating $100 per ton. There are other prospects in the district lately discovered which are quite promising. The lead carbonates assayed show a value of about $80 per ton in gold and silver. The opinion of many mining men who have visited the strike is that development is the one thing needed, and that careful exploitation will undoubtedly demonstrate the value of the camp. The conditions seem to be favorable and many look forward to the time when the Harqua Hala mountains will be a lively, populous and thriving mining district."

COLORADO.

LESSEES.—Georgetown *Courier*, Feb. 7: The lessees on the East Dives, Pope & Co. and Prout & Co., are taking out ore of a good grade. That of Pope & Co. returned as high as 572 ounces silver and 33 per cent lead. The McClellan is shipping a good deal of ore that mills all the way from 100 to 1500 ounces silver per ton. During the past week Barrett & Co., Omodt & Co. and Falkner & Co. of the Corry City mine, sent nearly 80 tons of ore to the Pueblo ore market, which milled from 40 to 200 ounces silver per ton. Five levels from the main shaft on the Pay Rock are being driven ahead, and good ore has been opened up in three of them during the past week. During the month of January 267 tons of ore were sold at the Public ore market, the assay value of which was $33,611. Frank Snodgrass is driving through a large body of blende on the Backbone. The directors of the Neath have taken treasury stock for their claims on the company, and have, by so doing, cleared the company of debt. Besides this, $5000 of the $7000 to be raised has come in, which gives the company a fair start. In 27 shifts during the month of January the Ashby tunnel of the Florence Co. was driven a distance of 110 feet, a trifle over four feet a shift. Forty feet was through red granite. The tunnel is 8x9 feet and three men are employed with power drills. The cost was less than $8 a foot.

IDAHO.

ORO FINO.—Idaho *Avalanche*, Feb. 9: We are reliably informed that a fine body of ore has been found in the Oro Fino, some of which is almost equal in richness to that taken out by Mr. Regan two or three years ago. We were shown some of the specimens brought down, which are covered with gold. Good ore is also in sight in two or three other lodes included in the Oro Fino group. The Leonard mill was running on good ore from the Oro Fino when it shut down, because ore could not be hauled from the mine, by reason of the roads. It will start up as soon as the ore can be hauled. It is again running.

THE RED ELEPHANT.—Wood River *Times*, Feb. 6: For some time past the Red Elephant group of mines, near Bullion, has been yielding an average of $1000 worth of ore per day. This amount will be doubled next week, when Colonel Bryan, the manager, will put on additional hauling capacity. A miner who recently worked in the group states that the production is intentionally limited at present, as Colonel Bryan intends to go East soon, to purchase concentrating works. The Red Elephant group is evidently developing into a big property.

THE SMOKY BULLION.—Michael Hennessy came in from Smoky, a couple of days ago, bringing samples of ore from the Smoky Bullion, a claim which he owns in partnership with Charles Sherry and P. H. Kinney of this city. The samples were from two veins which run parallel one to the other at a distance of about 300 feet. The samples from one vein showed a value of only 30 ounces silver and 83 per cent lead, and those from the other vein assayed 1933 ounces silver and 47½ per cent lead per ton. The owners intend to make at least one trial or test shipment before the breaking up of the roads in the spring.

ORE IN THE PARKER.—Wood River *Times*, Feb 2: The people of Ketchum have been feeling highly elated, since yesterday noon, over the news from the Parker, which is to the effect that a vein of first-class gray copper ore, carrying only three per cent of galena, has been cut into on the lowest level of the Parker. Chunks of the ore and thorough samples of the new discovery have been brought to Ketchum and handed about and assayed. They were found to carry 540 ounces silver. The ore is therefore of the high grade for which the Parker is so famous, and as the vein has every indication of being a permanent one, the leasers, W. H. Watt and Sam Allen, are to be congratulated. The ore vein is said to be 2½ feet wide.

MONTANA.

THE HELENA SMELTER.—Montana *Mining Review*, Feb. 6: One stack of the Helena smelter was fired up last Saturday, and two more furnaces will be fired up within ten days. The first shipment of silver-lead bullion was made from the smelter yesterday, Feb. 5th, and, Providence permitting, shipments of the same precious material will regularly go forward from this time forth, at the rate of 20,000 pounds per day until the other two furnaces are fired up, when the first section of the great smelter can be said to be in full blast, with a combined production of about 60,000 pounds of silver-lead bullion daily. Supt. Raht is highly pleased with the working of the machinery and other modern appliances connected with the smelter, to say nothing about the output of bullion, and judging from the smoothness with which everything seems to move, the Helena smelter has evidently started upon a long and successful career.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, Feb. 8: There is not a gold property of value in the Carlisle mining district for which negotiations are not pending. The Aztec Co. is shipping concentrates in carload lots. The Standard mill at Gold Hill will start up during the present month. Several interests in this district have been consolidated. Recent developments in the Potosi and Copper Glance mining claims, five miles southeast of Santa Rita, show up untold copper riches. A party of several gentlemen left Silver City last Saturday morning to examine the properties of Capt. Cooney on Silver creek in the Mogollon mountains. Negotiations have been pending for the purchase of these mining estates by an English syndicate, and the report and examination of these properties, soon to follow, will undoubtedly result in their purchase and complete equipment, and be the direct means of stimulating mining enterprises in other portions of this rich mineral-bearing range.

BLACK HAWK.—It is reported on good authority that the Good Hope mine in Black Hawk mining district has been leased. The owners of the Rose are taking out the water preparatory to the active resumption of work. Claim No. 2, formerly the Last Chance, a relocation on the north end of the Solid Silver, owned by Ben Hobson, is producing a very high-grade silver ore.

COW SPRINGS.—The Snowdrift mine, formerly the Alaska, has recently been sold to Mr. Hussey, the consideration being $3000.

MANGAS.—The Cora Miller mine in the Mangas valley, two miles below Mangas Springs ranch, has been leased to Mr. C. C. Martin for a period of six months. Mr. Martin has already begun operations.

OREGON.

$3000 FOR AN EXTENSION.—Bedrock *Democrat*, Feb. 6: We learn from parties down from Cracker creek that Fred Huntington has disposed of his Rainbow mining property, the extension of the Hurricane, to George Thompson, the consideration being $3000 cash down. The Hurricane is the property purchased by Mr. Thompson and his associates a few weeks since. The recent purchase would indicate that he is very favorably impressed with his first purchase.

WILL OPERATE EXTENSIVELY.—It is reported that the placer claims recently discovered on Powder river are soon to pass into the hands of a wealthy company, who will operate them extensively the coming summer. It will hardly be possible to work the ground during the high water in the spring, but later on that difficulty will be done away with by wing-damming or some other means to turn the water from its natural channel to enable bedrock to be reached.

UTAH.

ORE AND BULLION SHIPMENTS.—Park *Record*, Feb. 6: During the week the Crescent shipped 20,000 pounds of first-class ore. For the week just ended the Mackintosh sampler received 484 440 pounds of Woodside leasers' ore; 187,390 of Ontario, and 24,180 of Daly ore; total, 696,010 pounds. The Ontario bullion shipment for the week was 34 bars, containing 18,732.62 fine ounces of silver. There was no Daly bullion from the Marsac mill this week. Ore shipments have been rather light the past week on account of bad roads. Some sample lots of ore from Mexico have been received for experimental treatment by the Russell process at the Marsac mill. When Manager Wm. McKay was in town the first of the week he was heard to say that it was contemplated to resume work at the Massachusetts some time in May or June. Some fine specimens of ore from recent openings made in the West End ground were shown in the *Record* office a few days ago. The developments are of a very encouraging nature. On Thursday a ventilating shaft for the Ontario's big three-mile drain tunnel was started. It is being sunk at a point about 500 feet up from the mouth of the tunnel, and a depth of 100 feet will reach the tunnel level. The tunnel is being driven in comparatively easy working ground now and it is in upward of 750 feet.

MARKET REPORTS.

Local Market.

SAN FRANCISCO Feb 14, 1889.

General trade continues light. Owing to the dry weather and the light deposit of snow in the mountain ranges, merchants are disposed to pursue rather a conservative course, that is, they are not anxious to press goods on the retail merchant unless he pays cash or meets his engagements promptly. With a well-distributed rainfall soon, the present gloomy feeling will give way to a more hopeful feeling. With iron-workers there is more doing, but, as yet, business with them is far from active. In the local market money is reported to be generally easy. The savings banks have large sums idle. There is more inquiry for funds, with realty as security, but, as a rule, more money is wanted than the banks are willing to place on the property. The inquiry is chiefly from the country. The commercial banks report money easy, with no marked call from any quarter. The speculative movement in grain options continues to absorb some funds, but for speculating in local securities and mining stocks there is very little call, owing to the depressed condition of the market, chiefly in mining stocks. There is no question but that the past two months every means has been brought to bear to depress values so as to get the outside public to sell back at lower prices the stocks they bought at higher figures. How successfully it has been done, the empty boxes of the brokers and the empty pockets of the majority of the outside operators but too plainly show. Yet there are well-informed parties who look for still lower prices. Public advices from the districts whose mines are listed on the two exchanges, are of a bearish character, but reliable private information is very encouraging. The water in the Carson river, Virginia City, is reported to be increasing in volume, and more ore can be crushed if desired. From the mines our advices are as follows: In Crown Point they have uncovered a continuous body of good milling ore, running from the 300-foot level down to the 800 level, varying in width from 20 to 30 feet. On the 1700 level in the same mine, they are in on ore going $80 a ton; the width is given at 2½ sets of timber. The drift connecting Belcher and Seg. Belcher on the 1300-foot level has exposed a body of good milling ore, the assay value of which is not given. In Savage on the 400 and 500-foot levels an improvement is reported. Hale and Norcross has a large body of ore going about $60 a ton, from which, it is reported, they will soon begin to stope for milling. In Gould and Curry and Best and Belcher, promising work is being done. Continued good reports are made of Con. Virginia, but from the other North End mines there is nothing of interest obtainable. The work now going on in West Con. Virginia is being closely watched by mining men in Virginia City. From the Bodie and Tuscarora districts, important work is reported underway. From the Quijotoa district, Arizona, a correspondent writes as follows: There has been quite an excitement in camp for the last two days, about the discovery of a rich gold ore ledge, about one mile east of the Indian Chief district. They had some of the ore assayed, and it went $800 per ton in gold. The location belongs to Verdugo & Co. Free gold is to be seen all over the rock. All our mines in the district are in fact turning out excellent, and producing plenty of good ore, so it is immaterial to us whether the market booms or not.

At the California Electric Light Co. the writer was informed yesterday that the company had received word that it was not necessary to push the work in getting the other four dynamos to working in the Nevada mill, Virginia City, owing to the low stage of water. As less water is used since the two dynamos are in good working condition, mining men were led to the opinion that still less water would be required when all the dynamos are in use.

SILVER—The market strengthened the past week with sales made up to 93¾c for shipment by the last steamer to China, but at the close, buyers are bidding only 92⅞c, owing to the London market coming through at 42½d, with a weak tendency. Our market is very sensitive, due to the light output of the mines, chiefly in the Comstock district, where there is a small supply of water. Last month's report of Con. Virginia gives an increase in the percentage of gold. But the other mines in that district report about the usual percentage of gold.

The steamer that sailed for China on February 13th, took out the following: To Hong Kong, Mexican dollars, $208,615; silver bullion, $68,000; to Bombay, in silver bullion, $311,000. The market was well cleaned up by these shipments, but since then a few small consignments have been received.

QUICKSILVER—The market is strong at a slight advance. The demand is light for the season. The European market has fluctuated under manipulation.

LEAD—There are no changes to report in the market. The demand from canners is reported to be good, with considerable going out on orders and also on contract sales.

TIN—The market has a stronger tone, but no advance in prices is reported. The movement is chiefly in deliveries on contract sales, although some spot sales are reported.

COPPER—The market has a weak tone, owing to the conflicting reports regarding the financial status of the French syndicate. The general feeling is that the syndicate cannot control the markets of the world, and consequently a lower range of values is inevitable.

IRON—The market is reported to be steadier. The spot supply is quite large, but the quantity to arrive is said to be light. The demand is quiet.

COAL—The market for steam coals is said to be steadier at the low prices quoted. Several cargo parcels were placed at reduced quotations, netting to the importers quite a loss. Some Australian costing over $9 were placed at a loss of from $1.50 to $2.25 a ton. The tonnage on the berth at New Castle, Australia, for this port, is steadily increasing. For prompt shipment, $6.75 to $7 is asked. The output of house coal on this coast continues large. At the decline in prices the consumption is said to be increasing; probably this is due to a change in the weather, it now being colder.

Eastern Metal Markets.

By Telegraph

NEW YORK, Feb. 14, 1889.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	42¼	92¼	$16 65	$3 77½	$21 40
Friday	42¼	92¼	16 40	3 75	21 35
Saturday	42⅛	92⅜	16 40	3 75	21 40
Monday	42⅛	92⅜	16 60	3 70	21 25
Tuesday	42⅜	93⅛	16 60	3 67½	21 20
Wednesday	42⅜	93¼	16 60	3 65	21 35

Borax is steady, under the new arrangement. Outside rates for only jobbing business, refined, 8¼@9¼c; concentrates, 7⅛@8½c. Quicksilver—Frequent fluctuations; 25 flask lots were once down to 56@57c, closing with an advance abroad of 60@61c. Lake copper is dull, February and March ¼c below offering. There is a fair movement in pig lead, at lower prices. Tin is stronger at a slight advance.

Legislative.

Among other bills introduced in the Legislature is a very important one intended to remedy existing evils connected with employment offices. The main features are in the first section, which are as follows: From and after the passage of this Act, any person, firm, company or corporation doing business in any of the several cities, cities and counties, or towns within the State of California, as keepers, conductors or proprietors of any intelligence office, employment office or other place wherein fees are charged applicants for employment, who shall charge and accept fees from such applicants for situations that never existed, and who shall send or induce such applicants to go to any place or places for situations that never existed, shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine not exceeding $1000, nor more than 1000 days' imprisonment in the jail of the county, city and county, or town in the State of California within which such offense was committed, or by both such fine and imprisonment.

Goucher has introduced a bill appropriating $75,000 for a permanent fund for the purchase of jute at San Quentin prison. The bill is recommended by the Prison Committee. The present revolving fund of the prison is $40,500.

Murphy of San Francisco introduced a concurrent resolution instructing our representatives in Congress to urge a report on the bill to repair the flagship Hartford. Murphy stated that this bill had been passed unanimously by the House of Representatives, had gone to the Senate, and had been referred to the Naval Committee, where it had remained ever since. The resolution was passed unanimously.

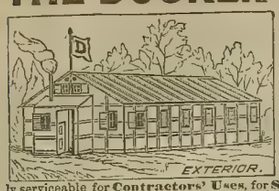
The bill appropriating $350,000 to establish an insane asylum at Ukiah went through the Assembly, receiving on its final passage 58 votes. It will now go to the Governor.

The proposed appropriation to the State Mining Bureau has been cut down from $150,000 to $100,000, which is $40,000 more than was given by the last Legislature. The institution is evidently becoming more popular now that its reports give some practical information to the mining community.

The Governor has signed the bill providing for the proper sanitary condition of factories and workshops and compelling employers in mercantile establishments to supply seats for saleswomen. He has also signed that raising the salary of the Labor Commissioner and giving him a deputy.

The Senate has passed the bill prohibiting the deposition of sawdust in the streams of the State; also that empowering the State Board of Fish Commissioners to remove obstructions in the American river.

THE DUCKER PORTABLE HOUSES



Combine all the comforts and advantages of a permanent building with the qualities of **Simplicity, Stability, Lightness, Ease of Transportation, Quickness of Putting Up and Taking Down, Ventilation, Heating,** and **Facility for Cleansing.** Equally serviceable for **Contractors' Uses,** for **Sheep** and **Cattle Ranches, Mining Camps** and for **Surveyors** and **Prospectors, Hospitals, Seaside** and **Summer Resorts,** and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to change location. These Buildings can be especially constructed for **Hunting** and **Fishing Camps, Billiard Rooms, Photographers' Studios** and **Lawn Pavilions.** They are built in sections and are put up without the use of screws, nails or any external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time with out skilled labor. Price, **$250** to **$750. Thoroughly reliable and influential business men only,** may communicate with this Company relative to acting as its representative.

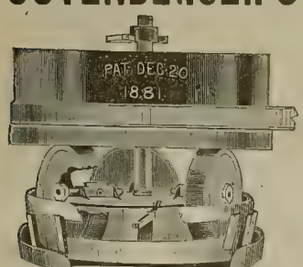
GUTENBERGER'S ROLLER ORE CRUSHER.



Crush 8 to 10 Tons per Day.

PORTABLE and DURABLE.

WEIGHT, 4 TONS.

It is a Full Fledged Quartz Mill without Gearings, Cogs or Pulleys.

Power applied direct. Works Ore at Low Cost. More or less weight on Crushers as desired.

Very little friction. Beats other machines in reducing and amalgamating ore, and costs less. All who have used this mill recommend it highly. Splendid for low-grade ore on account of low cost of working. The first ore crusher used in Durango, Mexico, was built at my shop in Sacramento, and under my patent.

☞ Any Infringement on this Patent will be prosecuted to the full extent of the law.

JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York.

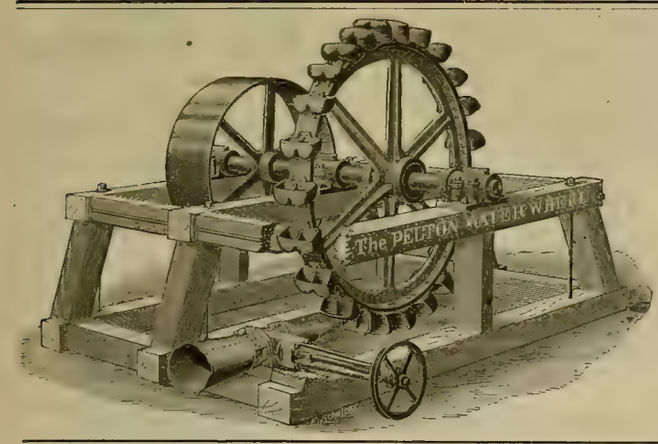
PARKE & LACY, General Agents, San Francisco, Cal.



THE PELTON WATER WHEEL

GIVES THE

Highest Efficiency of any Wheel in the World.

A MARVEL OF ENERGY AND POWER.

Over 600 in use on the Pacific Coast alone, aggregating upwards of 50,000 Horse Power.

It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Compressors, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and it is now being extensively used in this way in all parts of the country for producing both light and power.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

INVENTORS, TAKE NOTICE!

List of U. S. Patents for Pacific Coast Inventors.

Specially reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

[illegible]

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Pioneer Patent Agency the following are worthy of special mention:

Quartz-crushing Machine.—George A. Fuller, S. F., Cal. No. 396,262. Dated Jan. 8, 1889. This machine is intended for crushing ores of various degrees of hardness. There is a combination of the receiver or hopper having an eccentric motion from the lower end over which the ore is fed—the hopper having a spout and concentric seat to which the other end of which is pivoted to a stationary support, to enable it to be placed through the rock from the front to the rear and employing separate spout openings from the rear end of the hop- and separating and covering the seat. It consists also of a crusher composed of a bed-plate, a pivoted ring or spring-arm and a cone-plate as said ring and bearing it, a curve rock for carrying the crushable ring, and the cable for tightening it up. When a broken rock becomes away from any cause it is essential that it be immediately replaced. This is done by drawing the cable of the lower to expose a nut to part and the connection to chamber at the inner end of the bucket and fitted to pass upon the rod which is passed through the rock from the front and a plug and nut dimmer to move which have already been passed upon the front end of the rod so that by screwing up the front nut rock plugs may be drawn together tightly upon the end pieces of the rock. The chief advantages of the mode of operation are in the waste of time necessary for the cutter to cool after the drawing of the rock, the cutter of the boiler during this time and the danger to the operator and these rocks and to many attempts to plug the rock out only from the front. In these instances plugs of the form of ordinary interior sharpers have been passed through to the rear end of the rock by means of a rod, and also an expansible washer of packing has been employed, which could be pressed partially to cover the inner end of the rock. It is the object of Mr. Tanner's invention to provide a plug which can be passed through the rock from the front and not covered during passage to that upon emerging from the rear end of the rock it can be tried to place and cover the inner end of the rock in corresponding the same manner as the ordinary plug covers it at the front end.

Mining Share Market.

Mining shares on the San Francisco market appear to be very unsettled in character, at any change. The following is the

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

397,385.—CABLE OR ELECTRIC STREET RAILROAD—W. S. Phelps, S. F.

397,450.—BOILER-TUBE PLUG—E. W. Tucker, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COLLAR-STUFFING MACHINE.—George E. Hoyt, S. F. No. 397,292. Dated Feb. 5, 1889. The machine is intended for stuffing straw into horse collars. There is a combination of the receiver or hopper having an extension from its lower end over which the collar-tube slips, and a hook and counterbalance by which the collar-tube is held in place upon the filling-tube. The auger and actuating mechanism carry and pack the straw very firmly into the leather tube which is to form the collar.

BOILER-TUBE PLUGS.—Edwin W. Tucker, S. F. No. 397,450. Dated Feb. 5, 1889. This invention relates to the class of plugs or stoppers for closing up leaky boiler tubes. It consists essentially in a sectional plug adapted to be contracted to a diameter sufficient to enable it to be passed through the tube from the front to the rear end, said plug expanding again upon emerging from the rear end of the tube and encircling and covering its head. It consists also of a novel expansible plug consisting of a sectional ring by spring arms and a core fitting in said ring and holding it in place, the rods for carrying the expansible plug and the nuts for tightening it up. When a boiler tube becomes leaky from any cause, it is essential that it immediately be plugged up. This is usually done by drawing the fires of the boiler to enable a man to pass into the combustion chamber at the inner end of the tubes and then to place upon the rod which is passed through the tube from the front end a plug and nut similar to those which have already been placed upon the front end of the rod, so that by turning up the front nut both plugs may be drawn together tightly upon the end heads of the tube. The disadvantages of the mode of operation lie in the waste of time necessary for the boiler to cool after the drawing of the fires, the disuse of the boiler during this time and the danger to the operator, and these have led to many attempts to plug the tube entirely from the front. In some instances plugs in the form of ordinary interior stoppers have been passed through to the rear end of the tube by means of a rod, and also an expansible washer or packing has been employed, which could be pressed partially to cover the inner end of the tube. It is the object of Mr. Tucker's invention to provide a plug which can be passed through the tube from the front end and pushed entirely through, so that upon emerging from the rear end of the tube it can be fitted to place and cover the inner head of the tube in substantially the same manner as the ordinary plug covers it at the front end.

Mining Share Market.

Stocks continue dull, and there does not appear to be any immediate prospect of any change. The Virginia *Enterprise* says:

The mines along the lode still have good reserves of ore, and but for the unusual lack of water in the Carson river everything would be humming. A full milling stage of water cannot be expected. The small mountain tributaries of the Carson river are nearly all frozen solid, and until we have either rain or snow the water will steadily decrease in volume. A storage reservoir would now be a very good thing to have. The Nevada mill is running steadily to about two-thirds of its capacity. The water used there is made to do double duty.

The Virginia *Chronicle* says: The stamp-mills in Six-Mile canyon are in full operation again, their motive-power having been freed of ice by the mild temperature of the past week. The blanket-sluicers have also resumed concentrating sulphurets from ore tailings from the Chollar mill, the business proving profitable again now that the flow of the creek has been curtailed by discharging the water operating the surface Pelton wheel on those driving the Sutro tunnel dynamos.

The Con. Cal. and Virginia Company, after paying January operating expenses and disbursing the February dividend, has a cash surplus of $17,000. If the flow of the water in the Carson is not speedily increased by a snow or rainfall, the prospect of the bullion product of the mine the current month covering operating expenses and leaving a balance sufficient, with the coin surplus in the treasury, to cover a March dividend, is not flattering.

Diablo, 13, $7658; Peerless, 12, $3600; Savage, 12, $26,848; Bluebird, 10, $2960; Livingstone, 10, $20,352; Hanauer, 6, $2200; 7, $1750; 10, $2300.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

A. F. JEWETT—Tulare Co.
F. B. LOGAN—Southern California.
H. G. PARSONS—Southern California.
GEO WILSON—Sacramento Co.
W. W. THEOBALDS—San Diego Co.
J. C. HOAG—San Francisco.
CHAS F. BLACKBURN—Idaho.
FRANK S. CHAPIN—Colusa Co.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE owners of Thermalito colony intend to build a foot-bridge over the Feather river.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic & Pacific Railroad. They contain a first-class Engine and Boiler with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPY & CHILDS, 123 California street, San Francisco.

SHARES IN A GOLD MINE.

A limited number of shares of Buffalo Con. G. M. Co.—a developed and working mine in Sierra County, California—will be sold, in order to procure additional appliances in connection with the water supply. The mine has a mill and is producing good rock. The shares are non-assessable and held among a few owners, and none of them have been put on the stock market.

Apply to H. WIEDERSHEIM, Cave Cigar Store, No. 900 Market street, San Francisco, Cal., or by mail to No. 1513 Curtis street, Oakland, Cal.

FOR SALE.

The Empire Foundry and Machine Shop in the city of Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., etc., will be sold on easy terms. A first-rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address
R. HOSKIN, Marysville.

New Almaden Quicksilver.

J. C WINANS, 220 Fremont St., S. F., Cal.

F. H. HAUSMAN, Gold Mining Properties Bought, Sold and Developed.

Propositions from principals only entertained.
SAFE DEPOSIT BUILDING, ROOM No. 2

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

STOCKHOLDERS' MEETING.

OFFICE OF
The Superior Mill and Mining Company.

A SPECIAL MEETING of the stockholders of the Superior Mill and Mining Company will be held at the office of the company, Room 11, 303 California Street, San Francisco, California, on Wednesday, February 20, 1889, at 1 o'clock P. M., for the purpose of taking into consideration the increasing of the capital stock of said company from ten million (10,000,000) dollars, divided into one hundred thousand (100,000) shares of the par value of one hundred (100) dollars per share, to fifteen million (15,000,000) dollars, divided into one hundred and fifty thousand (150,000) shares of the par value of one hundred (100) dollars each. Transfer books will close on Monday, February 18, 1889, at 3 o'clock P. M. By order of the Board of Directors.

J. M BUFFINGTON, Secretary.

OFFICE—Room 11, No. 303 California Street, San Francisco, California.

EXTENSIVE GOLD MINE FOR SALE.

To be sold at public auction by the undersigned, at the Merchants' Exchange, in the City of Halifax, on Thursday the Fourteenth day of March next, at twelve o'clock noon, that extensive, valuable and well-equipped GOLD MINE known as the Dufferin GOLD MINE, situate on the Atlantic coast, about ninety miles east of said city. Daily mail from Halifax. Telegraph office at Salmon river, four miles from the works. Salmon river harbor never freezes, and is safe and easy of access. The mine embraces 342 areas, each 150x250 feet, all in one block. The entire area measures fifteen hundred feet in width across, and eight thousand five hundred and fifty feet along the lodes. The leases have nearly fourteen years to run, and can at any time be renewed for a period of twenty-one years, upon payment of two dollars per area. Within this area is a belt of veins dipping on each side of an anticlinal. They have been found by tests made on the surface to extend upwards of 4,000 feet The ore has been partially removed to a depth of 200 feet over a distance of about 700 feet, and to a depth averaging about 70 feet over an additional 1,000 feet in length or thereabouts. The veins are of various width, the largest averaging about ten feet of solid quartz.

This mine was discovered in the Autumn of 1880, but was not worked to any extent until the Autumn of 1881. It has yielded up to the end of November, 31,012 ounces of gold from 64,508 tons of quartz, according to the sworn returns made to the Mines Office. The gold can be produced at a cost which will leave a very handsome margin of profit.

The mine is operated by machinery worked by water power, the power being transmitted by a line of wire rope running from the water wheel to the mine—a distance of about 4,750 feet—and lying parallel to the outcrop of said veins, at a distance therefrom of about fifty feet. The Salmon river crosses the property twice. It supplies the hoisting and pumping power, and the same water is afterwards used to drive the crusher. The latter has thirty-eight stamps, and there is ample water power to operate three times that number. Sixty stamps can be operated with present machinery. Of the 120 horse-power existing for pumping and hoisting only about twenty-five is used. There are about 700 acres of well timbered and well watered land owned with the mine. This partly covers the areas, and where it does not immediately adjoins them. It is also provided with a steam plant to operate hoisting gear and pumps in case of accident to the transmission power, a sawmill, sufficient for the requirements of the property, a tramway from the mine to the crusher for carrying quartz, and stables, offices, and boarding-houses, sufficient to accommodate a large number of employees.

The mine is owned and has been operated by a partnership, and owing to the death of one of the principal owners it has to be sold to enable his estate to be settled. A good title will be given.

Terms, ten per cent cash, balance within thirty days from day of sale. The deposit to be forfeited in case the purchaser fails to complete the purchase within that time. Further particulars can be had on reference to N. H. MEAGHER, Q. C., Bedford Row, Halifax, or to JAMES DUGGAN & SONS, Auctioneers, Bedford Row.

HORACE D. RANLETT, Ores, Mining, and Commission,

420 Montgomery St., S. F.

Dewey & Co.'s Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Mining and Scientific Press. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

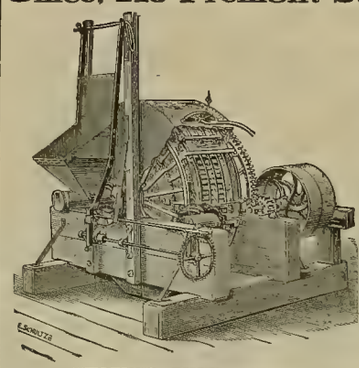
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1865.]

Office, 213 Fremont St., San Francisco.



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

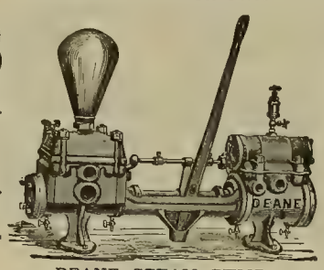
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale — GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.

Sheet-Iron Water Pipe

For Mining and Irrigation Purposes.

Also Sawmill Machinery.

EXCLUSIVE AGENTS FOR THE PACIFIC COAST OF

HEINE PATENT SAFETY BOILER and MACBETH STEEL PULLEY.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL,

The most perfect Roller Mill made, for the following reasons:

1. It is cheaper.
2. It is more durable.
3. It crushes a larger amount of ore with less power.
4. It amalgamates a larger percentage of the gold.
5. Its "clean-up" is quicker and fuller.
6. It is portable, requires no frame-work, and is ready for the foundation as it leaves the shop.

Full Descriptive Circulars of any of the above sent on application.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO., San Dimas, Durango, Mexico, October 25, 1888.

Risdon Iron Works, San Francisco.—GENTLEMEN: Our Company has been operating three of the 4-foot Bryan Roller Quartz Mills one of which has been running steadily or three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60-mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screen 12 tons in twenty-four hours; through 50-mesh, 15 tons; and through 40-mesh, 18 tons. This proportion has been continuous. One set of Dies will crush from 1500 to 1600 tons. One set of Tyres will crush 1500 tons. One ring plate will crush from 2200 to 2300. The mills require very little attention. At our mill an ordinary "peon" earning one dollar per day has complete charge. In regard to sliming, in comparison with stamps by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slimes is created. A three years' experience teaches me that, in every respect, the mills are a complete success and of material benefit to the mining world. They can be set up and running in 48 hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequaled by any mill now in existence.

Yours truly, D. M. BURNS, Superintendent.

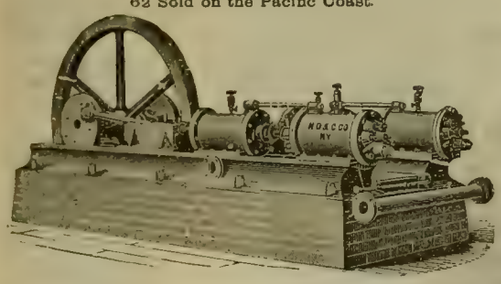
COMPRESSED AIR and WATER POWER MACHINERY.

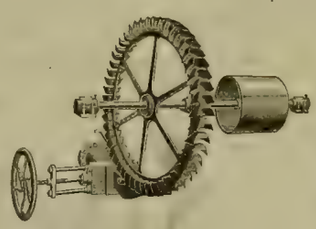
RIX & FIRTH, 225 and 227 First St., San Francisco.

NATIONAL AIR COMPRESSORS.

SINGLE OR DUPLEX, STEAM OR BELT POWER.

62 Sold on the Pacific Coast.



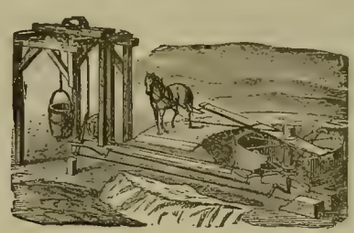


KNIGHT'S WATER WHEEL,

—FOR—

MILLS, PUMPING AND HOISTING.

Over 300 in use. All estimates guaranteed. Send for Circular.



MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth of 350 feet, giving entire satisfaction to the prospector. Price, complete, $200. 150 sold on this Coast.

NATIONAL ROCK DRILL.

200 sold on this Coast. Has less repairs than any other Drill.

BUILDERS OF

MINING MACHINERY.

GENERAL OFFICE AND WORKS:
127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

SAN FRANCISCO, SATURDAY, FEBRUARY 23, 1889.

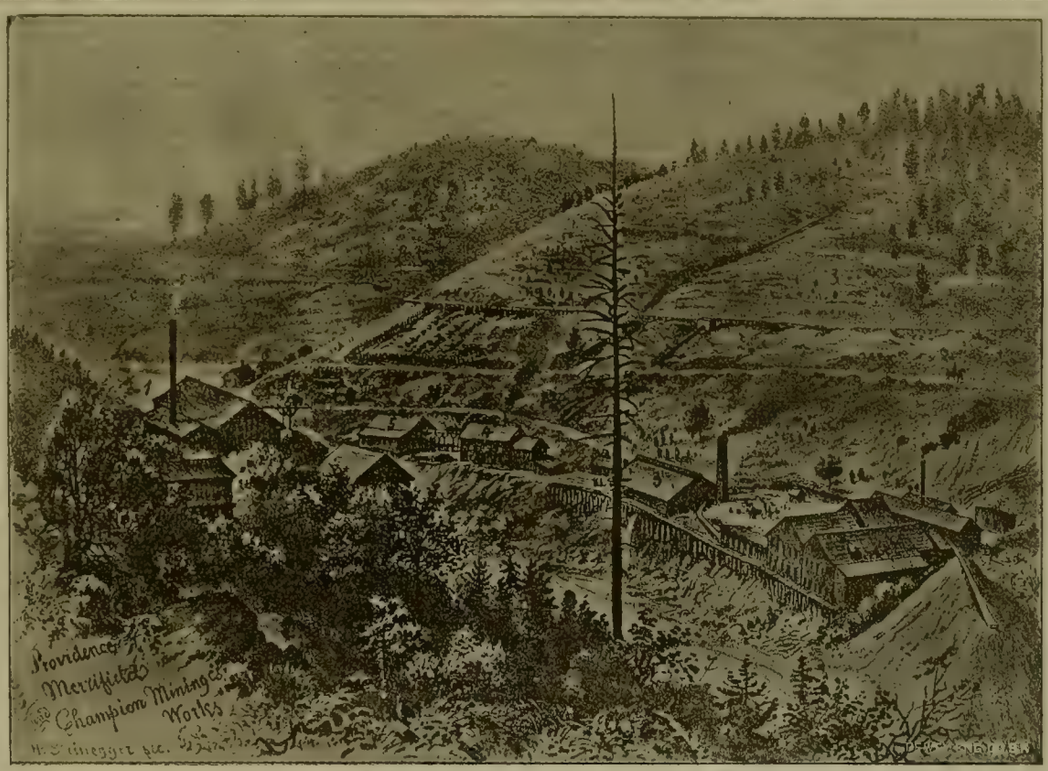
VOLUME LVIII Number 7.

Nevada City Mines.

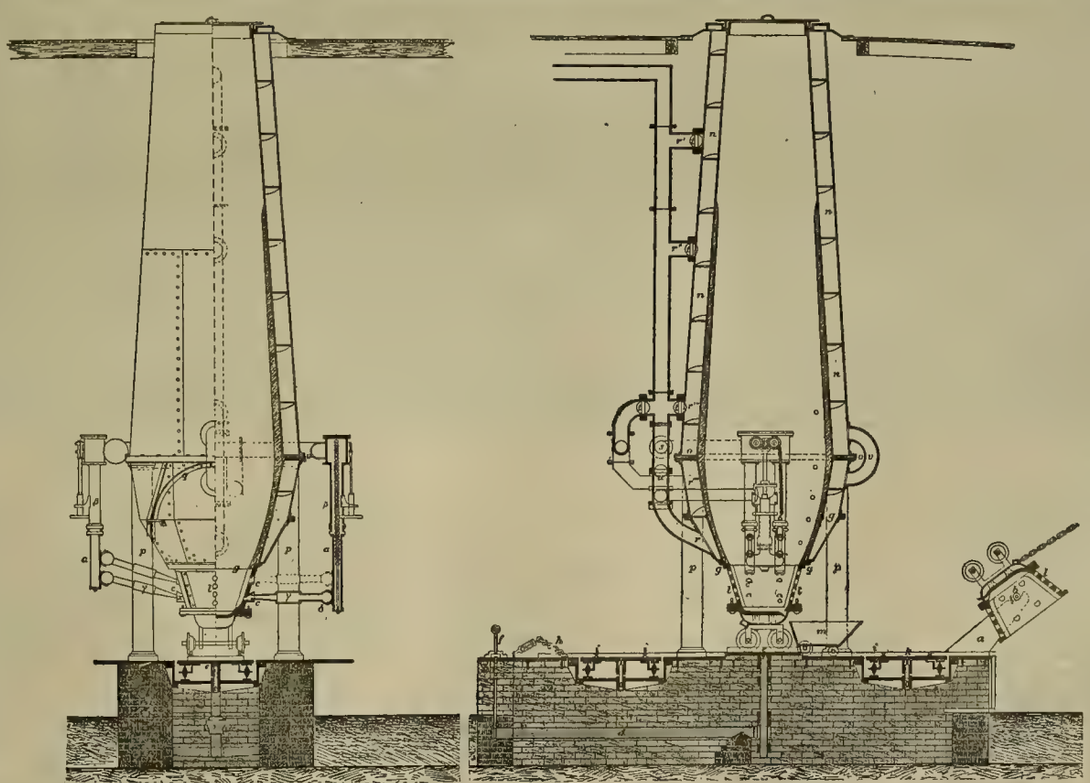
A sketch is given on this page of some of the mining and reduction works on Deer creek, Nevada City district, Nevada Co., in this State. In the sketch No. 1 is the Providence hoist; No. 2 the Merrifield mill; No. 3 the Merrifield chlorination works; No. 4 the Champion hoist; and No. 5 the Champion mill. The building further on, beyond No. 5, is the Wyoming hoisting works.

The Providence mine has been let to tributers of late, and efforts have been made to "place" it on the London market. The Champion has a ten-stamp mill, which is supplied with ore yielding from $5 to $9 per ton in free gold and four per cent of sulphurets. The latter contain from $70 to $75 per ton in gold. The vein is about two feet wide.

The Merrifield chlorination works are leased by Mr. H. Stansfield, who buys concentrated sulphurets from the various mills, paying from 85 to 90 per cent of the result of sample assay. His charge for custom work is $18 per ton. These works consist of a reverberatory roasting furnace 70 feet by 10 feet, with a capacity of three tons of concentrates in 24 hours. The works contain two chlorine generators, four "gassing tubs" (chlorinating vats) three precipitating tubs for gold, three for silver, and other usual implements and apparatus. The dimensions of the "gassing tubs" are: diameter six feet eight inches, depth two feet six inches inside, with a capacity for three tons of ore. The precipitating vats for gold have a diameter of six feet and a depth of three feet, those for silver being of like dimensions. The leaching tubs for silver are similar to the "gassing tubs." The vats are coated with a mixture of asphalt and coal tar, in the manner first introduced by G. F. Deetkin, M. E.



REDUCTION WORKS ON DEER CREEK, NEVADA CITY DISTRICT.



WARTSILA FURNACE, 1884.—Half-Elevation. (See page 137.) WARTSILA FURNACE, 1884.—Vertical Section.

In the report of the State Mineralogist it is stated that after the gold has been leached out, the ore, if it contains silver, is transferred to the silver leaching-tubs, where it is leached with calcium "hypo" for the silver. The latter, after being thus extracted, is precipitated as silver sulphide in the precipitating-tubs, by stirring in a solution of calcium polysulphide. On the sides of the silver precipitating-tubs a thick black crystalline crust has formed, which contains a large proportion of silver, it being probably gypsum and silver sulphide.

The chlorine generators are of the pattern formerly used by Prof. Crosby at Nevada City, being without stirrers. They stand in a slightly inclined position, so that the bottoms slope downward from the point of ingress of the acid. A water bath is used for heating the generators, it being preferable to a hot plate, as it prevents too high a degree of heat, which causes the solid in the generator to form a hard crust, troublesome to remove. The tops of the generators are of the flat style, luted in a flange. They very seldom require to be raised, as, by avoidance of too high heat, the exhausted charge is readily removed by means of a stream of water, through the spout in the side, which passes through the wall of the iron pan forming the water bath. For the eduction of the chlorine there is a short, wide standpipe in the cover, in the upper end of which is fitted a plug of lead carrying the eduction pipe, also of lead. Another similar arrangement carries the S tube by which acid is introduced, this being made wide enough to serve also, on removing the plug, for the introduction of the charge of manganese

(Concluded on page 137.

CORRESPONDENCE.

We admit unindorsed, opinions of correspondents.—EDS.

Moths, Gnats and Skeeters.

EDITORS PRESS:—From the earliest that we read of the Rocky mountains, the buffalo or bison seldom, if ever, crossed to the west of those mountains, albeit there is abundance of good buffalo feed between the Rockies and the Sierras. Lewis and Clarke tell us that the Shoshone Indians of what is now Eastern Idaho and West Montana were compelled, at the risk of being scalped, to cross the mountains for buffalo meat or starve to death; that was in A. D. 1805. The buffalo did not then cross the Rockies nor ever since. Is that beast afraid of a mountain? No. I have walked in his ancient trails where he used to cross the mountains in Virginia. In fact, the National road from the Atlantic seaboard to the Ohio river, practically followed the old buffalo trails across the mountains. What then was it that kept the buffalo to eastward of the Rocky mountains? I answer: "*Gnats and skeeters.*" The nearer you approach westward toward those mountains the more numerous become the alkali flats with their accompanying little sandhills. In these sandhills breed myriads of almost microscopically small black gnats with silky white wings. These gnats, though small, are powerful—very powerful—and they are "pizen" to a buffalo. They get in among his long hair and set him "plumb crazy." And I assume, from some actual observation, the depressed places on the "plains across," commonly known as "buffalo wallows," will be found most numerous near the alkali country, or also near streams where mosquitoes abound.

Now, when one reflects on the vast herds of innumerable buffalo seen by Lewis and Clarke, and so recorded, 84 years ago, is it not wonderful that the route of the yearly journeyings to and fro, north and south, of these vast herds, should be directed by a miserable little gnat? There is a gnat called the "buffalo gnat," but I do not think it is the same as the "alkali gnat" nor quite so venomous.

Let us take note of what a large contract the gnats once had in the buffalo business. The History of the Expedition of Capts. Lewis and Clarke says, under date of July 11, 1806: "They" (the buffalo) "at this season, are bellowing in every direction, so as to form an almost continual roar, which at first alarmed our horses, who, being from the west of the mountains, are unused to the noise and appearance of these animals." The expedition was then on its way home to St. Louis from the Pacific Coast, and these buffalo were seen on the headwaters of the Missouri river.

Again, "Saturday, July 31, 1806, during the whole night the buffalo were prowling about the camp and excited much alarm lest in crossing the river (Upper Missouri) they tread on the boats and split them to pieces."

"Sunday, August 1st. * * * * * The buffalo now appear in vast numbers. Such was the multitude of these animals, that although the river, including an island over which they passed, was a mile in length, they stretched, as thick as they could swim, completely from one side to the other, and the party (of the expedition) was obliged to stop for an hour." The river at that point, before it is split by the island, is one mile wide, so that here was a column of solid buffalo beef more than a mile square succeeding itself every minute for an hour. That scene must have meant *meat.*

Again, says this history, "August 29, 1806 (near the mouth of White river, now Lyman county, Dakota.) * * * * These last animals are so numerous that from an eminence we discovered more than we had seen at one time; and if it be not impossible to calculate the moving multitude which darkens the whole plain, we are convinced that 20,000 would be no exaggerated number."

[NOTE.—These are but a few of the herds mentioned by Lewis and Clarke in the years A. D. 1805–6, the history of the expedition of many herds numbering from hundreds to thousands in each, and to-day, January 29, A. D. 1889, the American bison is extinct. Gone, gone, gone!]

Now about the gnats and skeeters. A mosquito is bad enough, but not so bad as the gnats of the alkaline plains. You can scarcely see those gnats and you cannot feel the biting in their first work on you, when they are biting, but in a few hours afterward the external skin about your head, ears, eyebrows and whiskers becomes sore and irritable—you are tempted to rub or scratch, and the external layers of the skin peel off, to the red, in a thin, angry blister. Into this blister the gnat works daily, aided and abetted by his cousin, the mosquito, unless you tie up your head in a veil of very fine meshes or dope it with rank bacon grease; goose grease tinctured with kerosene is good enough.

Lewis and Clarke call these gnats by different names, frequently denominating them "eye-gnats," and I assume that this name is given because the earlier noticeable work of the gnat to a "tenderfoot" is seen just in and below the eyebrows. But the "Expedition" does not speak—that is, not seriously—about gnats until it gets into the alkaline country along the upper portions of the Missouri river. Of course all along this river and its tributaries, when the wind and weather will permit, countless millions of mosquitoes are not exactly like angels on the wing. The mosquito, however, does not go very far out upon the treeless, naked, breezy plain, away from shade and water; but the gnat is found wherever alkali abounds, and that is nearly all along the more immediate eastern slope of the Rocky mountains. From the Pacific surf to the summit of the Rockies—some 600 miles—the "Expedition" records no complaint about gnats or mosquitoes, albeit they journeyed on the waters of the Columbia river in canoes most all the way; but just so soon as they turn the summit and start down the eastern slope, the complaints begin.

At a distance easterly of nine miles down from the most easterly summit they camp for the night, and make this entry in the journal of travel on the 7th of July, 1806: "We procured some beaver, and this morning saw some signs and tracks of buffalo, from which it seems that those animals do sometimes penetrate to a *short distance* within the mountains." [The italic business is mine.]

Now let us notice from this history how troublesome the gnats and mosquitoes were to the voyageurs. On the way out there is constant cry about these insects, particularly the mosquitoes, as the party voyaged by water. Above the great Falls of the Missouri—now in Choteau county, Montana—July 13, 1805, * * * * the mosquitoes and gnats persecute us as violently as below, so that we can get no sleep unless defended by biers (bars), "with which we are all provided." And thus it continued to the fountain-head of the Missouri; at which point, by the way, one of the men employed by the expedition, putting a foot on each bank of the little "spring branch," took off his coonskin cap and enthusiastically exclaimed: "Thank God, I've lived to straddle the Missouri river."

But it was on the return trip the insects made monstrous manifestations. At the Missouri Falls, July 15, 1806. * * * * "We are now troubled with another enemy, not quite so dangerous as the grizzly bear, though even more disagreeable; these are the mosquitoes, who now infest us in such myriads that we frequently get them into our throats when breathing, and our dog even howls at the torture they occasion."

At the mouth of the Yellowstone river—now Gallatin county, Montana—in camp "Aug. 4, 1806. The camp became absolutely uninhabitable in consequence of the multitude of mosquitoes; the men could not work in preparing skins for clothing, nor hunt in the timbered lowgrounds."

"Aug. 5th, as they proceeded. On one occasion Captain Clarke went on shore and ascended a hill after one of the big horns; but the mosquitoes were in such multitudes that he could not keep them from the barrel of his rifle long enough to take aim."

The quotations are not taken from random notes of individual travelers, but from the archives of the United States Government, sanctioned and sanctified by being indorsed by the sacred name of Thomas Jefferson, President.

Who would want to be a buffalo and take the risk of going any further west in such a country?

I have no hesitation in attributing great powers to insects. Livingston, the African traveler, informs us that he could not take his horses and cow-cattle into the interior of Southern-Central Africa because a fly, the tzetze, bit them to death. And I know from much reading and some earnest experience that a few "bugs" are laboring night and day to get up a "fruit trust," and to control the horticulture, viticulture, citriculture and several other cultures in California.

There is much to be learned from insects even by capitalists, monopolists, and trustmongers, or by the lounging, non-laboring, never-sweats of the labor howlers. Finally, brethren, let us all piously remember that the Good Book says in one of its entomological verses:

"Go to the ant, thou sluggard."

Yours largely, J. W. GALLY.

Watsonville, Jan. 29, 1889.

SCRUB TIMBER IN NEVADA.—D. L. Bliss of Carson testified before the sub-committee of the Senate Committee on Mines and Mining that if the cutting of scrub timber on the lands of Eastern Nevada was prohibited it would put an end to mining operations there. He swore that the timber was unfit for any purpose except to be used for firewood, etc., and that the refusal to permit it to be cut would ruin the farmers as well as miners, inasmuch as the farmers depended upon the miners to buy their produce.

THE suit of Richard F. Knox et al. against the Great Eastern Quicksilver M. Co. has been dismissed in the United States Circuit Court by consent of both parties. The action was commenced to recover $40,000 for the alleged infringement of a patent on furnaces, but since then the parties to the action have settled their grievances out of court.

IN testing steel at the factories for U. S. war vessels, a good many boards of naval officers are necessary. The Secretary of the Navy has a new plan, which is to hold manufacturers responsible for all steel used and only test it after the vessel is ready.

The Acorn and the Oak.

[Read before the California Academy of Sciences, Feb. 4, 1889, by THEODORE H. HITTELL.]

I hold in my hand an acorn. It is the nut of that species of the oak which is familiar to everybody throughout California, and commonly called the Californian White Oak. To science it is known sometimes as *Quercus Hindsii*, sometimes as *Quercus Longiglanda*, and sometimes, and most generally, as *Quercus Lobata*.

This acorn, as will be perceived, is elongated, conical and rather sharply pointed. It is about an inch and a half long and half an inch in its thickest transverse diameter. Such seems to be the usual size and shape of the nut; though in some cases, owing to peculiar conditions, it is found as much as two and a quarter inches in length, and a little thicker, or a little thinner, than half an inch crosswise, as it may happen.

In solid measurement, it may be estimated, with sufficient precision for present purposes, to be equal to two cubes of half an inch each—in other words, to one-quarter of a cubic square inch.

The oak which produces it is common throughout nearly the whole State of California, on the plains and in the foothills, and forms one of the most attractive features in the landscape of our beautiful valleys. It is a majestic tree in appearance, sometimes with a trunk as much as twenty feet in circumference, a hight for the topmost branches of a hundred feet, and a spread of limbs on each side of sixty feet.

In some cases under extremely favorable circumstances, the outer branches hang down with an almost uniform size of ten, twenty, thirty or more feet, the lower ones sometimes reaching the ground. Trees with such depending branches frequently receive in popular phrase the name of hanging or weeping oaks; but they do not essentially differ from the other white-oaks of the State.

In all, there appears to be a tendency in the ends of the long branches to depend; and in the cases referred to this tendency is so greatly developed that the small outer limbs seem to hang like leafy vines, and to sway backward and forward in graceful sweeps with every breath of the summer zephyrs.

Taking one of the best specimens of this magnificent tree, and calculating the solid contents of its wood and bark, and it will be found to contain about eighteen cords, or, in rough numbers, about four million (4 000,000) cubic inches This makes a mass sixteen million (16 000,000) times larger than the acorn. There can be no doubt that every oak tree, or nearly every tree, that is found in the State grew from an acorn; but, on the supposition that some trees have grown up from the roots of other trees produced from acorns, then the above-mentioned comparatively immense mass of wood and bark, considered as getting its start from a single acorn, must be prodigiously increased.

If the acorn be opened by cutting through the hard outer shell and examined, it will be found to consist of two equal or nearly equal halves, between which at the pointed end is a body, looking something like a very small, smooth, whitish-colored worm, usually called the germ. It is this germ that grows when the acorn is placed under the proper conditions of heat and moisture. The other parts, the two halves before mentioned, are merely the food stored up for the support of the germ in its earliest stages of growth, and the hard outer shell is merely the armor, which protects the germ and its store of infant food until such time as it may find proper conditions of heat and moisture for its growth. Such being the case, it is evident that the size of the great tree, before spoken of as containing a mass sixteen million times larger than the acorn, must, if compared with the size of the little germ, be increased many thousands of times. And again, if the germ be microscopically examined it will be found that its life-bearing part, the part which grows or originates growth, is a mere cell, so small as to be invisible to the naked eye. If an attempt should be made to compare the size of the full-grown tree with the size of this cell, from which it starts when it commences its growth, the calculation would lead to almost endless files of figures like the blackboard filling quantities that are used in astronomical determinations.

It was at one time a question whether the acorn originally came from the oak or the oak from the acorn; in other words, which was first created. According to the first chapter of Genesis, "the earth brought forth grass, and herb-yielding seed after his kind, and the tree yielding fruit, whose seed was in itself, after his kind." It is difficult to understand exactly what was meant by this account of creation. Until comparatively recent times, the general understanding seems to have been that the tree full grown, with its fruit and seed fully ripened, was at once produced by creative act. But the statement that the earth "brought forth" the grass and the herb and the tree yielding fruit, does not affirm that it brought them forth in the beginning in any different manner from that in which it brings them forth now.

How is the oak brought forth now? Unless the acorn is subjected to the proper conditions of heat and moisture, it remains an acorn.

It is difficult, perhaps impossible, to say how long it could be kept an acorn capable of germinating. Doubtless a very long time. It is said that some of the wheat buried in the pyramids of Egypt three thousand years ago, will still germinate and grow. If this statement be correct, there is no good reason why an acorn, capable of germinating, might not be kept for nearly as lengthy a period. As long as it can be and is so kept, it is obvious that it contains within itself the principle of life. It is in all essential respects a living thing, though not in the sense in which the term [illegible] ordinarily understood. It has no [illegible] and no growth or change of sub[illegible] more than so much other dead or in[illegible] But for all this, it still lives, is still [illegible] thing, or, if the expression be preferred, ing being. When such an acorn is subject[illegible] the proper conditions of heat and moisture, [illegible] little germ begins to move and expand. The principle of life within it, which has hitherto remained dormant becomes active. The process consists in the first place of an appropriation by the germ of the matter which is stored up in the acorn itself. Very soon the germ, as it moves and expands, bursts the shell of the acorn; and while one end springs upward toward the light and air, the other end sinks downward into the ground. In a comparatively short time all the food-matter, which is stored up in the acorn, is appropriated. By this time, however, the plant has begun to draw the food necessary to its growth from the air by means of its leaves and stems, and from the ground by means of its roots; and it goes on thus drawing and appropriating food from the air and the ground until in the course of time, by continued appropriations and accessions, it becomes the magnificent tree which so often excites the admiration of the traveler in our scenes of quiet sylvan beauty.

The fundamental principle in the growth of the plant, after it has taken its start, is the appropriation and incorporation into its own substance of various inorganic substances, which it finds distributed at large in the air and earth. The chief of these substances, or, in other words, the main food of the plant, is carbon. This carbon is eliminated through chemical processes from the carbonic acid contained in the atmosphere by means of the leaves and stems, all and every square inch of which is more or less exclusively devoted to this purpose. Such being the case, it is obvious that all the outside of a plant is, so to speak, its stomach, or, in other words, the organ or series of organs by which it assimilates its food. In this respect it, of course, differs from an animal, the fundamental idea of whose organization is an inside sack or stomach, comparatively small in size and being the only part of the animal body adapted to the reception and assimilation of food. Broadly stated, therefore, one of the great differences between the animal and the plant, in addition to those more obvious characteristics which distinguish the separate kingdoms of nature to which they respectively belong, is that while the animal has a stomach resembling a sack with the food on its inside, the plant has a stomach like a sack turned inside out with its food on the outside.

Another of the great differences of the same general character between the animal and the plant, and arising chiefly from the before-mentioned differences of their organs of nutrition, is that while the food of the animal is mostly either in a solid or fluid form and consists almost exclusively of organic matter, the food of the plant, with the exception of some comparatively small quantities of water and earthy matter taken up by the roots, is just as exclusively of inorganic matter and just as entirely of aeriform or gaseous nature. Whatever and however important a part the water and earthy matter extracted by the roots from the ground may play in the growth and development of the plant, there can be no question that the main, and, as before stated, almost exclusive, source of its food, is the carbonic acid gas of the atmosphere. This is produced and thrown out into the air by combustion of various kinds, and not least by the combustion upon which animal life depends, and is wafted and distributed over the earth by the winds. Thus the currents of the air are the food-carriers of the forests and fields as the currents of the sea are the food-carriers of the continent-forming shell banks and coral reefs.

In the days of Job—who, by the way, was one of the first and best of scientific observers—it was supposed that wind alone as a food-supplier could afford but a lenten entertainment.

It will be recollected that, as an illustration of the very acme of vanity and emptiness, the patriarch was substantially asked whether he could fill his belly with the east wind. The answer, had there been a direct one, would probably have been, No. But on the other hand Job might just as well and just as truly have answered that the grasses and the herbs and the trees, that yielded him and his flocks food, filled their bellies with the east wind and found it very solid and substantial pabulum.

To consider for a moment how the southeast trades suck up the waters of the South Pacific; how they carry them over one-half the globe and pour them with open-handed liberality upon our Californian orchards and fields, opening their pores and enabling them to transform and assimilate the substances contained in the air into fruit and grain, and how they thus yearly crowd our markets and pack our warehouses and load our ships, we may well say: "Perhaps not directly, but indirectly, Yes; we are all filling our bellies with the east wind."

The facts that the atmosphere is the food-magazine and that the winds are the food-carriers of the vegetable kingdom, and the fact that the food of plants is not only inorganic, but gaseous in its nature, lead naturally

to the question, what change takes place when the food contained in the atmosphere is converted into the substance of the plant? or, to come back to our special subject of investigation, how is the great oak produced out of the little acorn? As the process goes on from the first movement of ... there is plainly a continual accession ... absorbed by the leaves from the air ... reformed from inorganic into organic ... or, if the expression be preferred, from ... matter into live matter. What quality is ... communicated to the carbon, that is incorporated into the growing oak, which was not contained in the carbon that was circulating over land and sea on the wings of the wind?

If this quality be life, and if this life be something which was not inherent in the inorganic matter, then it follows that every particle of living matter contains something which did not exist in it before, and which could not exist unless it were newly created. If this thing called life is then a newly created thing, it must be created with every change of matter from the dead inorganic state to the living organic state. Such a supposition would of course necessitate the assumption not only of an infinite number of little creations going on at the same time, but also of an infinite series of such little creations succeeding one another as long as living beings should grow and should continue to grow. Every leaf and every infinitesimal cell of every leaf of the oak is a laboratory where this change is going on; and the whole oak, as a living integer, is but an aggregation of an infinity of these little changes, each one of which, separately, is so small as to be invisible.

In contemplating the growth of the oak from the acorn, therefore, and comparing the great mass of living matter contained in the eighteen cords of which the full-grown tree consists with the microscopic germ from which it originates, we are obliged either to consider each increment of growth as a new creation caused by a separate act of creative power, or to attribute it merely to a new arrangement of matter arising necessarily from the inherent nature of the matter entering into the new growth as subjected to the influences surrounding it. When a loadstone is brought close to iron filings, the latter move and arrange themselves in definite lines. There are in this case movements, and movements in an invariable direction, in accordance with the position of the magnet and the inherent nature of the particles of iron. But the movements of these particles are not regarded as out of the natural order of things or involving the exercise of any extraordinary or unusual powers. Again, when a solution of salt reaches a certain density, a certain number of the salt molecules shoot out in invariably definite directions and form those magnificent aggregations called crystals. Here again there are movements and movements in an invariable direction inherent in the nature and constitution of the solution itself. The formation of the crystal seems in one sense to be the creation of a new thing; but chemistry teaches us that there is nothing in the crystal that was not in the solution, and that the only change which has taken place is merely a change in the position of the molecules of the salt, they being in the one case held suspended in the solution and in the other case aggregated according to definite laws of polarity in the solidified mass. Wonderful as the formation of the crystal is, the powers which produce it are inherent in the nature of the substance or substances which build it up. But no one regards these powers as extraordinary. On the contrary, they are supposed to be as natural as the law of gravitation or any other of the conditions under which all matter exists.

If, now, we contemplate a growing oak leaf, and carefully examine the composition of the new structure, we will find that it has merely added to its size by increments of new matter taken from the surrounding medium. It has managed like the loadstone to draw from the atmosphere the particles of matter suitable to its growth, and, like the crystal, it has arranged them in definite positions. The formation of the leaf is a more complicated process than the formation of the crystal, but there does not seem to be any good reason, merely on account of its greater complication, to suppose that the one is any less a natural process or any more requires the exercise of creative power than the other.

There is nothing in the completed leaf that was not in the material environment, any more than there is anything in the crystal that was not in the solution.

In each case, matter of certain kinds was aggregated under certain conditions; and, so aggregated, the live leaf was the natural result in the one case just as the definitely angled crystal was in the other.

Mention has already been made of the acorn as capable of existing for an indefinite period simply as an acorn, with the principle of life contained within it in a dormant state. If such an acorn were never to sprout, it could not in the ordinary sense be said ever to live as an independent being. But if at any time, be the period a year or a century or thirty centuries, it should be subjected to the proper natural conditions of heat and moisture, it would immediately assume the movements and qualities which are termed life.

If what is thus called life is the natural result, and nothing more than the natural result, of the influence of the heat and moisture upon the dormant and otherwise dead matter of the acorn, why may not the combined heat and moisture be called the cause of the resulting life? If they do not create the life resulting

(*Concluded on page 133.*)

THE NEW UNITARIAN CHURCH, SOUTHWEST CORNER GEARY AND FRANKLIN STREETS, SAN FRANCISCO.—See page 133.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KEYSTONE.—*Ledger*, Feb. 16: Some 30 men were discharged from the mine last Saturday. It is understood that this is a preliminary step to the closing of the mill. The mill is running at present to its full capacity, but we learn that the Blue Lakes Water Co. has been notified that after the present month no more water will be needed at the mill, unless a better grade of ore is encountered. It is of course the intention to do some extensive prospecting before any idea of final abandonment is entertained. This prospective suspension or partial suspension of work at the famed Keystone is the severest blow that has fallen upon the mining industry of the county for years. The Keystone is the oldest bullion producer in the county, and has probably contributed more to the world's stock of gold than any other mine in the county. For many years the ore averaged from $10 to $12 per ton, and her monthly output reached between $30,000 and $40,000. For several years past, however, the quality of the rock has seriously deteriorated, and of late it has failed to respond in paying quantities. Although prospecting has been carried on very extensively, no ore body of any consequence has been discovered below 1200 feet. The stoppage of the mill will throw 60 or 70 men out of employment.

AMADOR GOLD MINE.—The south shaft is now down 450 feet where the company are cutting out for a station, after which the sump will be made and ground excavated for the water-tanks. The shaft will then be prepared for the pumps and skips. Laborers are now grading out for the ore bin. Monday a gang of men will commence getting out rock for the foundation walls. One hundred and sixty-five rods of ditch have been completed.

MISCELLANEOUS.—Mr. Ballard of the New London mine is expected up this week, when steps will be taken toward the erection of a 40-stamp mill on this property. W. G. Anderson of the New York mine has received reports from the ore he shipped to San Francisco to the effect that it assayed over $40 per ton.

PLYMOUTH CON.—Forty stamps of the Pacific mill were started this week. Additional men are being put on almost daily, and Plymouth begins to assume an air of activity once more. The general opinion still is that the Empire mill will not be started.

ALPI.—*Dispatch*, Feb. 16: We visited the Alpi last week and found the shaft down about 25 feet, while the tunnel which is being run in to tap the same is in about 40 feet. Like the other mines south of Sutter creek, the quartz is east of the granite, with a gouge between. The ledge is an immense one and the only question is will the rock pay? The sulphurets have a copper color, and the rock is flinty. Neither is a good indication, yet every piece of quartz prospects well. The ledge is so large and so easily mined that we believe it will pay, and well, too, if managed right.

MORLEY MINE.—This is a new name to Amador miners, yet it is none other than the old Wetzlar claim in Hunt's gulch, three miles south of Jackson. The new company evidently means business, as on the first of this month they gave a contract to the Risdon Iron Works of San Francisco to erect and complete for them a 20-stamp mill.

Butte.

THE GOLDEN QUEEN.—Oroville *Mercury*, Feb. 16: The ten-stamp quartz-mill at the Golden Queen mine at Forbestown is completed. In the coming spring another ten-stamp mill will be added. The mine shows a better prospect than ever before. A seven-foot ledge, heavily sulphureted, carrying about ten per cent, has been shown up. The coming summer the owners contemplate the erection of chlorination-works with a capacity of three and perhaps six tons per day. Never before in the history of Forbestown were the prospects more flattering for a big yield in quartz mining. Big shipments of bullion have already been made to the mint.

Calaveras.

BALD HILL.—*Mountain Echo*, Feb. 16: A few days since we were shown some splendid specimens of quartz taken from the Bald Hill mine, situated near Albany Flat and about two miles southwest of Angels. The ore is of a different character from any we have yet seen in this section. It was taken from a depth of 60 feet, where the vein is nearly six feet in width. The specimens shown us would, in our judgment, yield at least $500 a ton. The ore contains a large per cent of sulphurets, some of which have been tested and yielded as high as $2400 a ton. This property was formerly known as the Brunner mine, but is now owned and worked by Thos. Machell & Co. It has always been the supposition that this mine was only a surface talc formation and, therefore, of little value, but later developments have proved it to be a true fissure and a valuable mine.

MOKELUMNE HILL.—The quartz mines in and around Mokelumne Hill have not even been prospected, and, judging from the enterprise displayed in that direction of late years, they never will. There are many good ledges in and around Mokelumne Hill, which, if developed, would prove productive mines.

El Dorado.

MIDDLE FORK. — Georgetown *Gazette*, Feb. 14: Wm. Roland passed through Georgetown on Monday, from Placerville, on his way to the Middle Fork G. Mining Co.'s mines, owned by Prof. Price & Co. Some three months ago Mr. Roland began the work of prospecting a large and promising ledge for the company on the El Dorado side of the river, just below Volcanoville, in Sec. 7 of Tp. 13 N., range 11 E. A tunnel has been run on the ledge 200 feet, and a crosscut made which shows the lode to be 28 feet wide, and looking well. This mine has the advantage of abundance of timber, as well as great depth to be gained by tunnel.

PURCHASE.—H. M. Dains has purchased A. W. Porter's mine, between this place and Georgia slide. This mine is generally well spoken of by miners.

EQUATOR.—Placerville *Observer*, Feb. 12: On Friday last, Supt. Burdick brought up from the Equator mine a lot of ore which prospects up to his expectations. The Equator promises now to be one of the big mines of the county. That company deserves success for their perseverance.

Mariposa.

GRUB GULCH.—Mariposa *Gazette*, Feb. 16: The prospects here are bright. The Josephine mine, controlled by an English company, has a force of about 50 men, and the mill runs night and day. Mr. J. B. Little, the superintendent, is a man of practical mining knowledge, and everything is in splendid working order around the mine and the fine 20-stamp mill. The Haley mine employs about 25 men in the mine and mill, and the rock is extremely rich for milling. The Pool mine, two miles below the Haley, promises to develop into one of the richest mines in that section. The owners, at present, have only an arastra to use for prospecting, but if the present rich indications hold out they will soon build a large mill.

Monterey.

COAL MINES.—Monterey *Cypress*, Feb. 11: Mr. Bassett bought from the Sur Chiquito coal mine, the other day, several chunks of that excellent coal, one chunk being about two feet wide and four feet long and weighing over 100 pounds. Mr. Bassett stated to a *Cypress* reporter that the old tunnel is being cleaned out as rapidly as possible with a view of developing the vein, which, judging from present indications, will average about four feet and will furnish tons upon tons of this valuable fuel. The Sur Chiquito coal mines are situated about nine miles south of Monterey. The coal resembles more the celebrated steel shale found in England than any other coal on this coast; it is a bright shiny black and falls in flakes when struck with a hammer. This coal has been tested for gas and is pronounced equal to the best English article. For burning qualities it has no superior, all being consumed to white ashes, not a particle being wasted. When the roads leading to the mines have been properly repaired it is expected that coal sufficient to pay the running expenses of developing the mine will be shipped. This coal brings two dollars a ton more than any other local coal in the market.

LOS BURROS.—Monterey *Democrat*, Feb. 16: Mat Shadley, who had been sluicing his canyon claim and finding some fine nuggets, has had to abandon the work for lack of water. Phillips & Co., who have the contract for putting a tunnel into the Grand Pacific, are at work with three shifts of men, and expect to complete the job about the first of July. The tunnel commences in and is an extension of the Mars claim tunnel, which is now in 100 feet, and it is expected that before striking the ledge in the Grand Pacific the tunnel will have to be put in a further distance of 800 feet, or 900 feet from the mouth. The Mars claim, through which the tunnel has to pass before reaching the Grand Pacific, retains nine-tenths of all the ore taken out. The timbers used in this tunnel have to be hauled about a half mile, down one hill and over another to the mine. They are hauled by horses, with a sled on one end of the timber and wheels at the other.

Nevada.

NORTH BANNER CON.—Grass Valley *Union*, Feb. 12: The North Banner Con. Tunnel Co.'s mine is looming up as grand as the old mountain where it is located. The cleanup for the run of last week was 135 ounces of retorted gold. The mill has only 10 stamps and they are kept running night and day. Since the new mill has been started none of the sulphurets have been worked, and in consequence thereof there is now on hand about 30 tons of sulphurets worth at least $150 per ton, waiting to be worked. The Banner is a "fixed fact," and will be the means of developing the section of the country in which it is located.

THE NEW EUREKA.—*Transcript*, Feb. 13: Good progress is being made in the development of Messrs. Walrath, Skinker & Co.'s New Eureka quartz claim just this side of Grass Valley. The shaft is being steadily sunk, and several stringers of rich ore have been encountered. The vein fissure is wide and clearly defined. The New Eureka is just west of the famous Crown Point, and gives every indication of proving itself to be one of the most productive mines in that district where millions of dollars have been extracted by the Idaho, Old Eureka and other companies.

RICH ORE.—Nevada *Transcript*, Feb. 20: The Neversweat Mining Company are having 30 tons of very rich ore crushed at the Nevada County mill. Messrs. Rickard, Rowe and Parr have taken out several tons of ore from a claim at Canada Hill. They think it will pay $50 a ton. William Woolcock and Richard Webb are taking out quartz on tribute from the old California ledge. They have out a few tons of good-looking ore.

A MINE BONDED.—Grass Valley *Union*, Feb. 14: The Cassidy Consolidated quartz mining ground, which is located between the Empire and Pennsylvania Consolidated, on the western slope of Ophir Hill, has been bonded for $15,000, and work is to be commenced immediately.

SPENCEVILLE.—*Tidings*, Feb. 12: C. C. Bitner of Spenceville has resumed work on his mine, the Champion, a promising property. A number of Grass Valleyans have been inspecting claims in the same locality. The hoisting works on the Spenceville copper mine have been started up again.

Placer.

AROUND NEW CASTLE.—*News*, Feb. 13: Since operations on a large scale have begun in the Hathaway mine, a general revival in mining seems to have begun in this portion of Placer county. For some years past quartz mining has been decidedly on the decline; in fact but little attention was paid to the development of quartz. The Hathaway, which is now yielding up its wealth, was only operated in a hap-hazard manner, no effort being made to explore or work it systematically, and it was consequently of no material benefit to its owner or to the neighborhood in which it is located. Exploration carried on systematically has demonstrated that the Hathaway is a paying property that it will take years of labor to exhaust, and from which not only those immediately interested will derive benefit, but the county also. Hoisting works and a fine 10-stamp mill have been erected on the mine, and though work in earnest has only just commenced, the returns have been entirely satisfactory, and the property will be worked for all it is worth. The ore body is well defined, is extensive, and carries a paying body of free gold; also a heavy percentage of sulphuret ore that is very rich. At present about 25 men are employed on the property. It is stated upon reliable authority that just as soon as legal complications are settled the Gold Blossom mine will also be started up. This mine has yielded some fine ore in days gone by, but owing to the fact that the ore was base it was not worked up to a very high percentage. It is the intention of those interested to build smelting works, and if this is carried out there is no reason why the property should not become a dividend-paying enterprise. Messrs. Hartly & Co., Minnesota capitalists, are opening several quartz mines on what is known as the Hawkins Ranch, about four miles from Newcastle, all of which look well. They are all being opened through the medium of shafts, and so far as work has progressed the showing is good. They are operating a five-stamp mill on the ore extracted from one of the mines, and from what can be ascertained the ore is yielding well. The Chicago mine, near Penryn, will also be started up in a short time. The superintendent is expected up every day to commence work. From the fact that all the properties mentioned are within a radius of less than four miles of Newcastle, it is reasonably certain that our growing town will receive additional support from this source.

GRAVEL MINES.—Placer *Herald*, Feb. 16: The *Herald* is indebted to Mr. A. Clark for the following mining news: The last cleanup at the Mayflower yielded 1696 ounces or about $30,528 for a run of 30 days and 10 hours. The amount of gravel washed was 1665 tons, which would give an average of about $18 per ton for the run. An upraise has been made in the main tunnel, whence a drift has been run in a southerly direction through gravel that looks as rich as that in the main breast. The track is being extended down the canyon to the Live Oak mill, which has been leased and will be started as soon as water comes. The company will then have 30 stamps at work, and the output will be materially increased. The mine now gives steady employment to 110 men. At the Hogsback mine a second shaft, 100 feet farther back in the hill than the first one, has been sunk to the depth of 97 feet without striking bedrock. As bedrock was struck in the first shaft at 66 feet, this would indicate an abrupt decline in the bedrock, and the company may be saved the expense of running a second tunnel. The Red Point and the Breece and Wheeler mines are still paying well. The Eureka company, whose claim is nearly opposite the Red Point, after running a tunnel 700 feet in length, have been compelled to start a second tunnel 110 feet lower than the first, which is now in 80 feet. The Dardanelles is still paying very comfortable dividends.

BLUE GRAVEL.—Placer *Argus*, Feb. 16: The Live Oak Co. has struck blue gravel of the same character as the gravel in breast No. 3 in the bedrock drift, the bedrock still pitching.

Shasta.

POCKET AND SEAM.—Shasta *Courier*, Feb. 16: The pocket and seam miners in this neighborhood appear to meet with considerable success "at intervals," as one of them from Rock creek neighborhood said a few days ago, when he showed about two ounces of pure gold for that many days.

Sierra.

YOUNG AMERICA.—Sierra *Tribune*, Feb. 16: The Young America mine never looked better than it does at present. Good cleanups may well be expected each month. William Busch, the foreman, was down last Sunday and he says that there will be enough water to run the mill a month longer without any storm; but it is a pretty sure thing that we will have a storm before that time, and it is here now.

BUFFALO.—The Buffalo Co. has not started up the mill yet, and will not until they have sufficient water to run it with, or until they can put in an engine and boiler, which cannot be accomplished until spring.

Siskiyou.

QUARTZ.—Yreka *Journal*, Feb. 13: We learn that several good prospects in quartz have lately been found on the headwaters of Scott river, above Callahans, and that considerable work will be carried on during next spring and summer in sinking shafts and tunnels on various ledges lately discovered. Mr. R. J. Strode has lately discovered a valuable quartz ledge on Hungry creek in the Siskiyou foothills, the quartz from which at cropping assays about $50 to the ton, and about ten feet down, assays $90. If it will only mill one-quarter of the assay the mine will prove a big thing. The Scott Bar *Graphic* says the Quartz Hill Co., which suspended some time ago, will, we understand, resume operations Monday, on a more extensive scale than ever. McCook and three other miners are now making preparations to commence work on the Punch creek mine at Humbug, from which they obtained such good prospects last summer. They want to be ready for business as soon as the spring rains set in, to furnish plenty of water in melting the snow on the mountains at present, and more anticipated before February closes. Humbug creek promises to be one of the liveliest mining camps in the county this season, especially in quartz, as numerous new ledges will be opened as soon as spring weather is at hand to permit easier work in digging shafts and tunnels.

SCOTT BAR.—Cor. Yreka *Journal*, Feb. 16: Times are improving here. Quartz Hill mine and mill, at the upper end of town, are in full blast, going night and day.

San Bernardino.

CALICO MINES.—Los Angeles *Herald*, Feb. 16: News comes from the Calico district of the discovery of new and rich mines in that vicinity, and unusual activity in their development, it is said, is to be the order. The new finds are adjoining the well-known mines Waterloo, Josephine, Hebe and Grande. Mr. R. H. Cole, formerly of St. Louis, but engaged in the real estate business in Los Angeles for the past two years, has just purchased a mine in the district above mentioned, for which he paid $15,000. Mr. Cole, who has just returned from Calico, speaks in glowing terms of the future of that district. He says that he will fully develop his mine and will leave shortly for the East to obtain necessary the machinery for that purpose. He has procured the services of Mr. T. T. Andrews as superintendent, who is well known on the coast as an expert, and from his connection with celebrated mines on the Comstock and at Eureka, Nevada. Mr. Andrews is very enthusiastic over the new discoveries and pronounces them the biggest prospects in Southern California. There is plenty of water to work the new locations and they are handy to the railroad. Daggett is the nearest railroad point. The specimens of ore shown the *Herald* representative were very fine and the assays of ore, as taken from the bucket, show 40 ounces of silver to the ton, while selected ore has ranged as high as 109 ounces.

San Diego.

STONEWALL.—Julian *Sentinel*, Feb. 8: We understand that the richest ore ever found in this camp has been struck on the 370-foot level of the Stonewall.

REMOVED.—The hoisting-works of the Owens mine have been moved from the old shaft to the new one.

TUNNEL.—Robt. Gardner reports good headway with the new tunnel he is running in the Big Bend.

Tulare.

COAL.—Visalia *Times*, Feb. 7: The coal mines formerly owned by Robinson & Rawlins, on the west side, three miles from Colinga station, but which now belong to an incorporated company, are being worked night and day. Twenty-five men are employed by the company, and the daily output of coal is about half a carload. For heating purposes it is said that the product of these mines is unexcelled.

Tuolumne

A BONANZA.—Tuolumne *Independent*, Feb. 16: Another rich pocket has been found in the Bonanza mine, near the Episcopal church, in Sonora. It was struck on Saturday last, and finally cleaned out on Wednesday evening, the yield being about $65,000 in four days. In cutting out the pocket, one piece about 14 inches long, 8 wide and 6 in thickness, contained $15,000. This celebrated mine has yielded nearly a million of dollars, the original owners, Divoll, Clark & Bray, getting about $400,000. Later another pocket of $90,000 was found; still another of $60,000, and many others of smaller amounts. The mine is easily worked, only requiring the labor of three or four men. The probabilities are that still richer pockets may be found, as the mine is only developed in a small degree. The mine was leased about a year ago to J. P. Dart, Dave Oliver, M. B. Harriman, E. Keil and A. P. Johnson, all of Sonora. These men took the mine with an agreement to give the owners 20 per cent of what was made out of the work, the balance to be divided among the lessees. The interests in the mine are held by J. G. Divoll, who owns three-eighths of the property; Mrs. Divoll of Sonora, one-fourth; J. B. Bacon of San Francisco, one-fourth; and E. A. Rodgers, one-eighth.

MILLS.—Sonora *Democrat*, Feb. 14: The ten-stamp mill at the Platt & Gilson at Soulsbyville is rapidly nearing completion and will soon be grinding out the precious metal. The new 20-stamp mill on the consolidated Eureka mine at Summersville was started up Monday morning.

Yuba.

A PAYING DRIFT MINE.—Nevada *Transcript*, Feb. 19: At the Blue Point drift mine, Smartsville, nearly $4000 a month is being taken out with one arastra and 20 men. Another arastra, a rock-crusher and hoisting works are to be put up immediately. The force of men will be increased to 40, and it is expected $10,000 a month will then be produced.

NEVADA.

Washoe District.

CROWN POINT.—Virginia *Enterprise*, Feb. 16: No. 3 east crosscut, 800 level, is out 68 feet, having advanced 20 feet during the week. The face is in soft ground, composed principally of clay.

HALE AND NORCROSS.—On the 400 level west crosscut No. 1 is now advanced 70 feet. On the 500 level have started an upraise in the ore body from the north drift, which is now up 52 feet and continues in good quality of ore. The winze below this level is now down 68 feet. The bottom is in ore mixed with porphyry. The stopes above this level continue to yield ore of good quality. The stopes from the 600 to the 700 level are supplying the usual quantity of fair-grade ore. On the 700 level the upraise from the north drift is now advanced 50 feet in low-grade quartz. On the 1300 level the north drift is now advanced 165 feet. This drift shows stringers and bunches of high-grade ore. Have hoisted during the week 1048 tons of ore; have shipped to the Mexican mill 978 tons, and milled 990 tons. Average battery assay, $20.26 per ton.

SAVAGE.—During the week hoisted 672 tons of ore, shipped to the Rock Point mill 442½ tons and milled 500 tons. Average battery assay, $20.65 per ton. Total number of tons milled last month, 1900; gross bullion yield, $20,848.06.

CONSOLIDATED IMPERIAL.—East crosscut No. 2 on the 1100 level (Yellow Jacket) is being repaired. Some repairs are also being made to the main north lateral drift on the same level.

BELCHER.—Have started the drift east from the joint south drift on the 1100 level. Are now in 44 feet. Will probably start the winze from the end of it to-morrow.

YELLOW JACKET.—Everything is again in good mining order and the extraction of good white rock and shipments to the Santiago mill resumed as usual.

BALTIMORE.—The ore struck well out west on the 300 level last week continues to show improvement, and is considered very important by the management.

CHALLENGE CON.—Have shipped to the Brunswick mill for reduction 68 tons of ore, the average battery sample of which shows a value of $28.19 per ton.

CHOLLAR.—The prospecting drifts on the 550, 650 and 750 levels are still in favorable vein material. The Nevada mill is crushing the usual amount of ore.

SEGREGATED BELCHER.—Started the east drift from the joint south drift on the 1100 level and have advanced it 44 feet.

JUSTICE.—The ore-producing sections of the mine continue to look well. The mill is kept in constant operation.

SILVER HILL.—Opening and timbering a station at the 100 level. Shaft cleaned out to 400 level.

CONFIDENCE.—In consequence of an accident to the Yellow Jacket machinery the mine was shut down for five days, so that very little work has been

done during the week. Have shipped during the week 210 tons of ore, the average battery sample of which shows a value of $28.19 per ton.

OVERMAN.—The mine was worked six days and extracted 276 tons of ore and shipped to the Brunswick mill 333 tons.

ALTA.—The mine continues to look well, and the mill reduces about 30 tons of ore daily, yielding satisfactory results.

ANDES.—Repairing and cleaning out drifts on the 275 level, preparatory to further explorations.

POTOSI.—The exploring drifts on the 650, 750 and 850 levels continue in vein porphyry.

BULLION.—Work of exploration continues steadily in the vein.

NEW YORK.—Drifting north on the 800 level in vein material.

SCORPION.—Still crosscutting on the 300 level.

Cedar District.

LOOKING WELL.—*Silver State*, Feb. 11: E. N. Clark, who is engaged in mining in Cedar district, in the Antelope range, reports the mines looking well and some of them producing considerable ore. The Mohawk mine has been bonded to M. H. Sunderland of Rye Patch.

Cherry Creek District.

BULLION.—White Pine *News*, Feb. 16: The Merrimac Co. shipped one bar of bullion last week valued at $1700, $700 of which was gold.

Columbus District.

MT. DIABLO.—Esmeralda *News*, Feb. 16: The Mt. Diablo mine continues to yield all the ore, ranging from $50 to $100 per ton, necessary to keep the company's 20 stamp mill at Soda springs in operation continually.

Eureka District.

THE DIAMOND TUNNEL.—*Sentinel*, Feb. 16: The Diamond tunnel is now in a little over 140 feet. The ground is growing softer since the cutting of an iron streak a few feet back. Three eight-hour shifts have again been put on and good progress is expected from this time forward. It is believed that the tunnel will be completed in 70 days.

Garfield District.

BULLION.—Esmeralda *News*, Feb. 16: The Garfield mines, during the month of December, produced $10,200; 318 tons of ore were crushed, and the operating expenses were $8400.

Golconda District.

ADELAIDE COPPER MINE.—*Silver State*, Feb. 18: Work on the main shaft of the Adelaide copper mine at Golconda has been diligently pursued during the past two months. The shaft has reached a depth of 77 feet, and has been run in ore all the way. Ten feet above its present depth a body of high-grade oxides and sulphurets came in on the footwall. This ore assayed 22 per cent copper, and from $20 to $40 in silver, and has followed the foot down. In the bottom the black and yellow sulphurets assay 32 ounces in silver and $10 in gold. Water is looked for every day in the creek. On its arrival, with a large ore dump at the furnace, and coke and fluxes at hand, there is no reason why a successful run should not be made in the near future.

Jackson District.

PENNSYLVANIA MILL BURNED.—*Silver State*, Feb. 18: Dan Le Barron arrived here Saturday, bringing news of the burning of the Pennsylvania mill at that place. The mill comprised ten stamps, two pans, one settler and four concentrators. It was owned by the Pennsylvania M. Co., a S. F. corporation. The mill was discovered to be on fire on the evening of the 13th. A man named Albert Munroe slept in the mill, but at the time the fire was discovered was at Le Barron's place, a quarter of a mile from the mill. There was no person known to be at the mill at the time, and the origin of the fire is a mystery. The mill was insured last year for $10,000, but it is believed that the policy was not renewed.

New Pass District.

ON A GOOD LEDGE.—Reese River *Reveille*, Feb. 16: E. E. Starret returned to New Pass to-day. He tells us his mine is looking way up and that his men have 50 tons of ore on the dump, and the ledge stripped, ready to take out 50 more. He says his men, 14 all told, work with a will since they are now on a good ledge. These mines are worked more for the gold than for the silver which the ledges contain.

Reese River District.

THE PLYMOUTH SHAFT. — Reese River *Reveille*, Feb. 14: We sauntered up to the Plymouth shaft this bright day to see what the boys were doing on Lander hill. The Plymouth hoisting works and machinery look as bright as a row of new pins bought from a store. Wm. O'Donnell has charge of the forces timbering and from him we learn that there are three shifts of eight hours each, fitting new sets of timbers from the collar of the shaft downward. At noon to-day they had just put in a set at the 260 station, the limit of the present advance, and it will not be long before they reach the bottom, 400 feet in depth. The hoisting machinery was made by the Fulton Iron Works, and runs as easy as a clock—the best hoisting machinery on the hill. The Fulton Iron Works can show the machinery off for inspection any day and never get caught out, as it gives the best of satisfaction. The hoisting works is complete in every detail, forge, furnace and all.

Tuscarora District.

BELLE ISLE. — *Times-Review*, Feb. 15: South drift from east crosscut, 250-foot level, has been extended 11 feet.

COMMONWEALTH.—100-foot level: No. 2 east crosscut from main south drift has been advanced 19 feet; face is showing low-grade ore. West intermediate drift from No. 4 chute has been extended seven feet and continues to expose high-grade ore. North drift from No. 8 chute, to connect with west intermediate, has been advanced 11 feet, developing fine ore the entire distance.

FOUND TREASURE.—Prospect shaft has encountered the vein at the depth of 12 feet from the surface. The chloride ore is two feet thick at this point. Sufficient work has not been done yet to disclose the full extent of this chloride ore body, but so far as explored it appears of considerable extent and value.

NEVADA QUEEN.—The concentrating works were started again on the 13th inst. The ore chutes have been enlarged, the water tanks moved, and some of the machinery altered, all now being in good condition and doing better work. There is little or no change in the stopes. They look about the same and continue to yield the usual quantity of concentrating ore.

NAVAJO.—East crosscut from west vein, 350-foot level, extended 11 feet. The formation looks very favorable for ore. West crosscut from south drift from No. 4 crosscut extended 15 feet. The usual amount of ore has been extracted and sent to the mill.

GRAND PRIZE.—300-foot level: East drift, footwall vein, has been extended 10 feet; face shows a good vein of low-grade ore. East drift, hangingwall vein, extended seven feet; face showing bunches of rich ore.

NORTH BELLE ISLE.—No. 1 winze below 400-foot level, has been sunk six feet. Everything put in shape for crosscutting. The rock is harder, and an increased flow of water.

NORTH COMMONWEALTH AND DEL MONTE COMBINATION SHAFT.—The shaft has sunk to the depth of 160 feet. The rock is harder and the formation favorable for ore.

ARIZONA.

IMPORTANT STRIKES IN TOMBSTONE.—*Epitaph*, Feb. 16: Two important strikes of rich ore were made this week and at points some distance from each other, proving that the rich ore of this camp is not confined to a small area. The most important one, and on which the most work has been done, was in the Nicholas mine, which is near the Emerald and owned by Mr. Van Burt of San Francisco and R. C. Pearson of Los Angeles. The mine came into their possession something over a year ago, and since then they have sunk a shaft 100 feet deep, and it was while drifting on this level that the rich ore was encountered, which was some three weeks since. Samples of the ore were sent to Mr. Van Burt in San Francisco, the assays of which produced the astonishing average of 4032 ounces of silver to the ton. Mr. Van Burt immediately came to Tombstone to inspect his fortune and found a 12-inch ledge of this rich ore. He will have the ore sorted and shipped to San Francisco, the richest by express. The other strike has been made in the Equinox mine, which is about half a mile east of the San Diego smelter. Work has also been prosecuted on this mine in a desultory manner for some time and some fine ore taken out a few weeks since. Recently the mine has come into the possession of Mr. Joseph Bignon and he has had men at work on it and at present has an incline shaft down to a depth of 35 feet. Yesterday he received the returns of the assay of three samples of ore, which went respectively 16, 60 and 500 ounces in silver to the ton, the latter being from the bottom of the shaft where the ledge is 10 inches in width. These discoveries should have the effect of giving hope and putting energy in the owners of claims hereabouts to go ahead and develop their properties.

HARQUA HALA. — Prescott *Courier*, Feb. 16: There are a number of old shafts and workings in the Harqua Hala district, showing conclusively that mining has gone on there at some remote period in the past. A prospecting party discovered the skeletons of two men and three horses a few miles from that camp. The Tombstone *Prospector* has interviewed an old miner from the district, who says a well of good water has been struck near the rich find. That there is an old Spanish woman named Carmelita, living at Harrisburg, who, for the past three years has been locating everything in the shape of a ledge in the district, and that a slip of paper bearing her name is a very common find in the district. That the bonanza mine of the camp and most of the others are in litigation. The original discoverers of this camp were four men who pooled issues on a prospecting trip and went out, and while three of them remained in the mountains the fourth man was sent back for supplies. While he was gone the rich mines were discovered by the three, who proceeded to leave the fourth man out and to ignore any claim of his to the discovery. The fourth man is now trying to discover what sort of a partnership arrangement this is, and hence the property is in litigation and has not been bonded.

A BIG SALE.—*Journal-Miner*, Feb. 14: A sale of one-half interest in the Hillside, Eureka district, was closed a few days ago. The property consists of the Hillside group of mines, of which the Hillside and Seven Stars are the principal ones. They are situated in Eureka district 80 miles west of Prescott. The consideration, $100,000, was paid Mr. B. T. Riggs by Messrs D. Levy and J. Q. Stephens, for his one-half interest. The richness and extent of the mines are undoubted, and there is no mistake that the new proprietors have secured a great bargain. There have been more than 3000 feet of shafts and tunnels run on the property, everywhere showing the marvelous richness of the deposits, which are of a free milling character. During the past year over $50,000 have been taken out of the Hillside, Mr. Lawler, who retains his one-half interest, will continue to superintend work on the mine as heretofore. It is proposed to shortly place 60 or 70 men at work and put on several ten-mule teams to haul the ore to Prescott. It is the intention in the near future to erect reduction works.

CROWNED KING. — Prescott *Courier*, Feb. 12: The Crowned King mining properties are destined to soon come to the front as the most remarkable yet discovered in the Southwest. The owners, Messrs. Shekels & Place, have quietly developed this valuable property, but, as a result of their labors, it may now be stated that there is a tunnel of 600 feet in the Crowned King which runs the entire distance through a vein of rich gold-bearing ore six feet in width, which assays as high as $230 to the ton. This is a continuous, well-defined fissure vein. They have enough ore on the dump to completely bury a good-sized quartz mill out of sight, and it would keep a 40-stamp mill steadily at work to keep up with the output of the mine. When the weather settles, all the stopes will be filled with men. Machinery for the mine is now on the road.

COLORADO.

LAMARTINE.—Georgetown *Courier*, Feb. 14: The output of the Lamartine mine for the month of January amounted to $10,000. The mine has been producing about 50 tons of ore a month for the past year, the total value of which was about $40,000. Thirty-five men are employed. The output of the Colorado Central mine for the month of January was 251,373 pounds of ore, valued at $19,185.15. The property is in condition to about double this production but for the lack of power on account of the scarcity of water. A thousand dollars was offered for a sixth interest in a lease on the Colorado Central. It couldn't be bought for $5000. There are three men employed in the lease, but on account of the lowness of the water and the inability of the company to furnish the necessary power, they can work but about three hours a day, but manage to take out about $1200 worth of ore each week.

IDAHO.

CŒUR D'ALENE.—Wardner *News*, Feb. 9: There never was a season in any mining country with a more promising outlook than is now presented in Cœur d'Alene, and although the South Fork region leads in important disclosures of rich ore-bodies, still there have been many important showings recently made in other portions of the camp that go to prove that the early discoveries which created so much excitement were but promises of what was to come. There have been some remarkably rich developments made of late in several of our leading mines, and all locations on which any reasonable amount of work has been done are showing up finely. In nine cases out of ten the results have been better than could have been expected, and wherever disappointments have existed they invariably have been found to arise from other causes than from any failure of the mining property to fulfill its promise. Cœur d'Alene affords to-day the grandest field for exploration and investment of any country in the Northwest.

LALANDE DISTRICT.—F. W. Frank, who has held a bond on the San Francisco mine on Canyon creek, sold that property last week to a Montana syndicate. Mr. Frank returned from Helena on Tuesday and on that day made the first payment on the purchase to Charles A. Pearson, the former owner. Work will be continued on the mine by the newly formed company and operations on an extensive scale will be commenced immediately.

YREKA DISTRICT.—The Nellie Wood mine is more than holding its own and has improved vastly in appearance of late. On the Alpharetta a rich body of ore has been struck and the addition of new machinery and additional stamps to the mill has become a necessity. Ten stamps will be added to the 20 now in use and preparations are being made for the erection of new hoisting-works.

MONTANA.

THE SAN FRANCISCO.—Butte *Inter-Mountain*, Feb. 16: A Butte mining man who returned to-day from Phillipsburg and who is an entirely reliable mining authority, states that the report of a great strike in the San Francisco Con. in that camp was founded on facts. The strike was made in the 400 west and has been opened up for a distance of 80 feet, the ledge averaging four feet in width. The ore assays from 20 to 40 ounces in silver and from $120 to $150 in gold. The gold occurs in iron pyrites. Specimens of these pyrites separated from the gangue assay as high as $500 in gold. The melting-furnace for casting bullion at the Bi-Metallic was started up this morning. The 50-stamp mill of this company is running smoothly and more than meeting the expectations of the builders.

BIG MINING SALE.—*Inter-Mountain*, Feb. 12: The Parrot M. Co. yesterday perfected the purchase of the Rialto claim and its neighboring fraction, paying therefor the sum of $125,000. The Rialto was owned by Jas. A. Murray and A. J. Davis, the former holding three-fourths of the claim and the latter the remaining one-fourth. Mr. Murray makes $75,000 by the transaction and Mr. Davis gets $50,000. The Rialto adjoins the Parrot mine on the north and the fraction adjoins the Parrot on the northwest. The property is patented and is developed only by a 100-foot shaft.

RISE IN VALUE.—"The sales illustrate the rapid advance in value of Butte mining property," said Mr. Murray to an *Inter-Mountain* reporter, this afternoon. "Two years ago that property could have been purchased, all of it, for less than $50,000, and together with it would have gone another piece of property I sold for $65,000 also. There could be no better testimonial than that to the permanency of the camp. I have never known real estate and mining property so active as they now are in Butte."

NEW MEXICO.

SMELTER.—Silver City *Enterprise*, Feb. 12: W. G. Waring, superintendent of the Flagler reduction works, has returned from the East, where he was successful in interesting capital in the erection of a new smelter and sampling works. The works will either be here or at Deming. Last week a force of men was put to work on the Rose mine by J. R. Johnson, and are now busily engaged in pumping out the water. The mine will be cleared in a few days, when exploiting will be commenced. The stamps of the Mimbres mill will commence dropping on regular time on the 4th day of March. The mill is now in fine condition for business, having been completely overhauled, and will now turn out on an average from $1200 to $1500 in silver bullion daily for months to come. Thos. B. Pheby, the company's manager, has a large amount of ore on the dumps and in the bins at the mill, and is of the opinion that another shut-down will not be necessary this year. Thomas Foster of Gold Hill has secured an option and bond on several of the best claims in that camp, and the probabilities are that there will soon be a grand consolidation of interests, and the erection of a larger plant.

AROUND LAS CRUCES.—Rio Grande *Republican*, Feb. 9: Gibbs & Moody are still taking ore from the Comstock. John Thompson has a very fine showing in the Crescent City. It yields high-grade ore. Frank Arnett has been at work this winter on his claims in the Black mountain. They are showing up fine. The Bennett produced 600 tons of ore in the month of January, and declared a dividend of over $4000 net profit. Two cars of Bennett ore have been sent to Denver, where a proposition has been made to treat it for nothing, as it is a valuable fluxing ore. Adams & Co. are driving a tunnel on the Wall Street to tap the contact at a depth of about 100 feet. This property is being worked under lease and there is considerable low-grade ore in sight.

OREGON.

THE BIG ALECK.—Bedrock *Democrat*, Feb. 11: Supt. J. N. Williams of the Big Aleck mine recently purchased by the White Star M. Co. of Boston, last Monday paid over to Messrs. Ed. Hardy and E. H. Mix the sum of $10,000, the purchase price of the mine. In conversation with Mr. Williams the reporter was informed that it is the intention of the White Star Co. to commence active work on the Big Aleck in a few weeks. Mr. Williams' latest advices were to hold himself in readiness for orders to prepare the grounds for a large milling plant, probably two Huntington mills with 20 tons capacity each every 24 hours. Boarding-houses, lodging apartments and a blacksmith-shop will be built at once.

UTAH.

BEAVER COUNTY.—Cor. Salt Lake *Tribune*, Feb. 15: The mines in Beaver county are looking up, especially the Talisman, Red Warrior (Victory), Copper King, Massachusetts and some others that I have not been able to see of late. The Red Warrior has now a large body of low-grade but fine fluxing lead-silver ores in sight. The Talisman mine is a rich bonanza, in fact, to look at it will prove the truth of my assertions. I have seen it of late, and was agreeably surprised, and it has proved the fact that in west camp of Star district can be found true contact veins of high-grade ores The copper deposits of Star district are also proving good. The Copper King mine is increasing its force of miners. Dr. J. M. Bailey, who, with two others, leased the Antelope mine near Marysville a short time ago, reports to me that he has struck it big.

BULLION.—Salt Lake *Tribune*, Feb. 15: The receipts in this city for the week ending Feb. 13th, inclusive, were to the total value of $86,166.26, of which $45,878.61 was in bullion, and $40,287.65 was in ore. For the previous week the receipts were $66,187.89 in bullion, and $46,364.35 in ore, a total of $112,552.24. The Ontario product for the week was of bullion, 20,814.04 fine ounces; from ore sales, $9873.19; an approximate total of $30,687.23. The Horn Silver is pushing its shaft quietly, and selling a little ore. The Hanauer smelter produced during the week bullion valued at $10,500. Ore receipts in this city for the week amounted to $9873 by Wells, Fargo & Co.; $26,100 by McCornick & Co., including $2500 Queen of the Hills; and $4314.65 by T. R. Jones & Co.

PARK NOTES.—*Record*, Feb. 16: The old Sampson company's property which was absorbed for debt last fall has undergone a change for the better. The old company's reorganization was perfected practically in Salt Lake on Thursday. The Alliance Company's property includes the Sampson's valuable ground and a few adjoining claims. This is a strong company and it is promised that with the opening of spring developments will be again inaugurated. James McCune has obtained on favorable terms a lease and bond to run five years on S. P. Hoyt's Wasatch and May property, two patented claims in Blue Ledge district. Several claims in the surrounding hills have been located and relocated lately. The Anchor drain tunnel is now in about 6000 feet and only about 600 remain to be driven through. It is understood that work on the Glencoe property will be resumed with the opening of spring. The usual small force is kept at work on the Morgan property. The McCune tunnel is now in upward of 1100 feet and lately the formation has changed favorably. On account of the poor condition of the roads, which prevents hauling, no Ontario, Daly or Crescent ore has been sent to market the past week. No Daly bullion has been shipped from the Marsac mill this month. However, large quantities of sulphides of silver, the result of treating the ore by the Russell lixiviation process, are on hand ready for shipment as soon as satisfactory rates can be had from the railroad company.

ORE AND BULLION SHIPMENTS.—During the week the Mackintosh sampler received only one lot of ore 552,500 pounds of Woodside leasers' ore. The Ontario bullion shipments for the week were 36 bars, containing 18,810.20 fine ounces of silver.

WASHINGTON TERRITORY.

CONCONULLY MINES.—Ellensburg *Capital*, Feb. 14: Confidence in the Conconully mines has increased with the developments made during the winter. Although the means for developing them was extremely limited, the work accomplished has been quite extensive and shows the veins to be as large and permanent as any yet discovered in the Northwest. With the mines thoroughly developed and opened up, the question of increased transportation facilities is the next to be considered. The line opened by way of Ellensburg last season proved successful, and is therefore no longer an experiment. Additional steamers will be put on this season and the line improved from Ellensburg to the Columbia to meet the increasing demands of traffic and travel. The miners of Conconully are also moving toward the improvement of the roads from the steamer landing to the mines, and anticipate having them in excellent condition in a few weeks. The ores of the district will find ready market in either Tacoma or San Francisco.

THE ARLINGTON.—Cor. Spokane Falls *Herald*, Feb. 16: As a big proposition the Arlington mine stands without a rival in the Okanogan country, as can be proven by a few facts obtained from one of the owners, who recently arrived from Portland—the headquarters of the company. Two hundred feet in depth, the vein will average five feet wide. From this level the south drift is in 25 feet with four feet of ore averaging 75 ounces of silver and $2 gold per ton. The north drift extends 45 feet, with 2½ feet of ore averaging 178 ounces of silver. There are now at the depot at Spokane Falls 300 sacks of mineral from this mine which will be shipped to Park City, Utah, for the purpose of treatment by the Russell process. There is no doubt but that the Russell machinery will be put in at the Arlington next summer at a cost of $50,000. A Portland syndicate paid $28,000 for the "prospect" less than 18 months ago, and at a recent meeting of stockholders an offer was refused embracing half a million dollars for the Arlington mine.

SCIENTIFIC PROGRESS.

Diatoms—A New Discovery.

Diatoms form a pet subject with most microscopists. A diatom is a single-celled plant, bearing a singular relation to the animal and even to the mineral kingdom, being considered by some as partly belonging to the latter, and regarded as a vegetable crystal, differing only from minerals in having the power of locomotion, and of multiplying through separation. The study of diatomaceæ is most interesting. Their extreme and varied beauty is a source of constant pleasure to the microscopist.

The beauty of diatoms consists in their color, their general form or sculpture. These delicate markings are seen under the microscope to be process, knobs, bosses, concavities, ribs, groovings and lines, so minute that the highest power obtainable by the most skillful optician is required to see them. There are more than 4000 distinct species of diatoms which have been classified.

Of all diatomaceous earths, the one which is most famous and contains so many varied forms of beauty is the "Santa Monica," which was found by Thomas B. Woodward of the United States Coast Survey in 1876.

It was found by itself, and there was no other sign of a deposit of the earth in the vicinity. The deposit from which it came is not known. Slides of this material grace the cabinets of microscopists in all parts of the world, and it is prized above gold. Search has been made in different parts of the globe by scientists, but no rival or equal of the "Santa Monica" has been found.

At a recent meeting of the San Francisco Microscopical Society, Prof. Hanks submitted a newly discovered specimen of diatomaceous earth which attracted much attention and was considered of great scientific value. The scrapings of the earth examined were unwashed and the powers used were not sufficient to determine whether the specimen was a "Santa Monica" or not.

A number of the members discussed a great number of resemblances, but were unwilling to pronounce judgment on so important a subject to the scientific world without giving the specimen a detailed and scientific study.

It was decided to cut the specimens into vertical sections and submit them to a most thorough microscopic inspection. If they in any way approach the "old Santa Monica," parts of the specimen will be sent to leading microscopical societies of the East and Europe.

A Novel Signal Rocket.

Engineering of London describes a newly invented rocket, brought out by a London company, the distinguishing features of which are that no stick is required and there is no back fire. The rocket takes the form of a metal cylinder seven inches long and two inches in diameter, in the base of which is the propelling charge. Above this is a charge of tonite, and above this again is a star composition. The rocket is placed in a phosphor-bronze socket, which may be screwed or let into the rail of a ship. The propelling charge is fired by simply pulling a lanyard, and the signal is propelled upward at one impulse. The wire fuse by which the detonating charge is exploded is at the same time ignited, and this burns until the rocket has reached the maximum hight, which is 600 feet.

The stars are thrown out, giving a brilliant illumination, and the tonite charge then explodes. The noise of the explosion is equal to the firing of a six pound gun; but being high, is heard at a great distance; indeed in one instance a disabled vessel brought another to her assistance from a distance of 12 miles. These rockets are so portable and easy to fire—no match or port fire being required—that they are very suitable for boats, and doubtless many lives would have been saved had they been in use in cases where shipwrecked crews have had to take to the boats. The Board of Trade has authorized its surveyors to pass these rockets distress signals in lieu of both guns and rockets, so that many lines of steamships have landed their guns and use these signals instead.

WHO DISCOVERED HYDROGEN?—In the current number of *Le Revue Rose*, there is a long article by M. E. Meyerson, written to prove that the French doctor, Theodore Turquet de Mayerne, who became physician to Charles II, was the only true discoverer of hydrogen. In that case all our books must be wrong. They teach that Cavendish first discovered hydrogen, calling it "inflammable air," in 1766; and that, in 1781, he first proved water to be a compound of oxygen and hydrogen. They teach also that Paracelsus in the 16th century obtained an inflammable gas by the action of dilute acid or certain metals.

A STUPENDOUS MYSTERY.—Proctor declared that few, even among scientific men, appreciate the amazing mystery of the force we call gravity. Wonderful as is the familiar attraction of bodies to the earth, gravitation is altogether a greater mystery when considered as a property possessed by matter. The universality of the property, which belongs not merely to this or that substance, but to every substance—solid, liquid or gaseous—and not to such and such aggregations of matter, but to the ultimate molecules and atoms, is an amazing, if not an appalling, mystery. Here is matter, which men call inert, not merely possessing inherent force, but with its whole texture instinct with inherent, unexplained, probably inexplicable, power. But if the universality of gravitation and the infinite range of the force thus exerted by all matter are wonderful, infinitely more wonderful is the instantaneous nature of its operation. This quality of universal gravitation is, indeed, so wonderful that few who hear of it for the first time can even admit that it is possible. Yet the astronomer has been able to demonstrate that the interval of time required for gravity to extend its action from one body in space to any other body, even if separated by a distance so great that light at 187,000 miles per second takes thousands of years to cross it, is less than any interval which can be measured.

PASSIVITY OF IRON.—It has been observed that iron which has been treated with concentrated nitric acid assumes a passive state and refuses to be acted upon by the common or diluted acid, but the cause of the property has not hitherto been satisfactorily explained. M. Louis Varenne reported recently to the French Academy of Sciences that he had remarked that passivity was destroyed and the metal could be made to yield to the solvent action after a shock or jar was given to it, or a current of carbonic acid or hydrogen gas was passed over it. He was led to believe that an envelope of gas was formed around the metal which protected it, and, on examining some passive iron, found that it was actually covered with a layer of gas. The metal was then placed in a receiver and a vacuum was produced, with care not to touch the iron or disturb it in any way, after which it was plunged into the diluted acid, when it was readily attacked. The nature of the protecting gas was ascertained by introducing a little air into the exhausted receiver, when the orange color characteristic of the nitrous vapors was observed. The gaseous sheath is, therefore, chiefly composed of the deutoxide of nitrogen.

A DREAM OF THE ALCHEMIST.—It was lately announced that Dr. Kruss, a chemist of Munich, has succeeded in decomposing cobalt and nickel, both of which have hitherto been supposed to be elementary substances. The New York *Times* interviewed Prof. Chandler and Mr. A. R. Ledoux, an analytical chemist, to get their opinions as to the results of this discovery. Prof. Chandler doubted the truth of the statement, but said that if it was true it only helped to substantiate the theory that all of our supposed elementary substances are mere compounds and alloys. Mr. Ledoux said that further details would be awaited with great interest. He thought it might be some new process, the application of which to other elements would produce like results. If the statement is true, there would seem to be the opening up of a new field that, scientifically, might prove of intense interest. It would bring us a step nearer to a demonstration of the dreams of the ancient alchemists, that the precious metals were alloys and interchangeable. If this were so, gold might be manufactured just as rubies are now manufactured, by a chemical process.

THE DISCOVERY OF THE MICROSCOPE.—M. Govi, an Italian savant, has presented a paper to the French Academy of Sciences, in which he claims for Galileo the distinction of having discovered the microscope as well as the telescope. He has found a book, printed in 1610, according to which Galileo had already directed his tube fitted with lenses to the observation of small near subjects. The philosopher himself stated shortly after this date that he had been able to observe through the lens the movements of minute animals and their organs of sense. In a letter written in 1614 to a Signor Tarde he states that he has with his microscope "seen and observed flies as large as sheep, and how their bodies were covered with hairs, and they had sharp claws." The date usually assigned to the discovery of the microscope is 1621, and the invention is attributed to Cornelius Drebble, a Dutchman; but, according to M. Govi, the date must be thrown back 11 years, and the credit of the first construction awarded to Galileo.—*London Standard.*

THE PLANET VENUS.—Walter H. Smith, president of the Astro-Meteorological Association of Montreal, has been making special observations of the planet Venus by the aid of a reflecting telescope. He reports that the rapid changes in the shape and outlines of the horns are due to the planet's rotation, which brings the mountain ranges to the edge of the disc. A peculiar dentation has been seen at the north horn, similar to the observations made by Divico Pastorf and other astronomers. Three spots are believed to be continents, and are similar to those seen by the Roman College of Italy.

EFFECTS OF MERCURY ON PLATINUM.—Thin platinum foil is unattacked by cold mercury, but after long boiling in a flask sealed to prevent the admission of air, the foil is gradually corroded. The platinum is only partially dissolved by the mercury, the greater part of that which disappears separating in the form of a black powder, which is nearly all held in suspension. The surface of the mercury remains clean, but if a current of air be drawn through it the platinum powder collects together, and if the mercury be then distilled, a very small residue of platinum is found.

MECHANICAL PROGRESS.

The Suppression of Smoke.

The suppression of smoke, especially bituminous coal smoke, has long been the earnest desire of the residents of cities, and the effecting of this result by some practicable means has long occupied the attention of experts and inventors in Europe as well as in America. The late Sir William Siemens gave much thought to this important question, but died before perfecting any method.

The results thus far attained in Europe are summed up in the following, from the report of the London Inspector of Factories, viz.: "The Smoke Prevention Exhibition in London stimulated a wholesome activity in regard to smoke-consuming apparatus, but the results have been disappointing."

The same, we believe, says the Chicago *Journal of Commerce*, is true, with one exception, with reference to every device thus far invented and fully tested in America. The fact that a large number of devices have been invented, and all have either failed utterly, or work satisfactorily only under certain conditions too ideal for practical use, has led many steam-users to settle into a conviction that a smokeless furnace is, like perpetual motion, impossible of practical realization.

The one exception noted above is a device invented by Mr. Thomas Murphy of Chicago, who, it is thought, has come nearer to accomplishing the desired object than any other inventor.

The efforts in this direction have almost universally been to *consume* the smoke. These attempts have been, as all such always will be, failures, because *burning* smoke is not only practically but also scientifically impossible. Another class, acting on a more intelligent basis, have sought to *prevent* smoke. The efforts along this line have given practical proof of the very obvious fact that the way to do away with smoke is to secure perfect combustion of the gases as they are forced out of the coal and before becoming transformed into smoke. Numerous devices have been invented with this object in view, and many of them, in fact most of them, have been successful to a greater or less degree. The great difficulty seems to have been that in securing perfect combustion the arrangement has made expensive or slow firing necessary, and thus the system failed when put to practical test, because it either increased the cost of fuel or labor, or both, or failed to develop the horse-power capacity of the boiler. These devices, while theoretically valuable, are nevertheless worthless for practical use.

The device referred to as really practical, is not described in the article before us, but reference is made to a previous description.

The following paragraph, however, will give some idea of the principle upon which the device is founded:

"The arrangement for feeding the coal is over an extended coking-plate, every foot of which is exposed to the full force of the heat of the furnace, and the admission of hot instead of cold air along the line where the heat of the furnace, forcing the gases out of the coal, admits of the coking of the coal and simultaneous burning of the gases with any desired rapidity. This is the core of the secret of his success. By the arrangement of the fire-box a saving is effected of the heat from the consumed gases ordinarily allowed to escape and waste as smoke."

The feeding is done automatically, as well as the cleaning, effecting a considerable saving of labor as well as additional effectiveness of the furnace.

The journal further says: "While we know there have been a few instances where the Murphy has been tried and declared 'wanting,' we know there are more than 300 in successful operation, nearly 100 of which are in Chicago, and we are convinced that in every case where there has been an apparent failure, it was not in any case due to any organic defect in the Murphy furnace, nor because of an impossibility to adapt it to the desired use."

THE DIRECT PROCESS AT BREWSTERS.—The Coneley Rummill Iron and Steel Co. of Brewsters, N. Y., will put up 20 retorts to manufacture iron direct by the Blair process, modified. The company uses concentrates from the Theall mine, operated by the Cheevers, mixes them with ground charcoal, and exposes them to the proper temperature in horizontal cast-iron retorts in which rotates a hollow water-cooled arm provided with plow blades. In three hours and a half the ore is reduced. Formerly it was shot into closed cars, allowed to cool, and was mixed with pitch and poured into barrels, to be shipped in that form to crucible and open-hearth steel manufacturers. The charge is about 1200 pounds. The company is getting ready to put up two double puddling furnaces, to use for balling the product.

BEHAVIOR OF TEMPERED STEEL.—B. Pensky, after experimenting with two steel rods 100mm. in length, observed that they exhibited an increase in volume after they had been tempered by heating to redness and plunging in water. This he attributes to the fact that the external layers solidify first, and consequently prevent, to a certain extent, the contraction of the interior mass during cooling. The length of the rods under these circumstances showed a variable behavior, inasmuch as one of the rods, 27mm. thick, in[illegible] the bucket, 0.083mm.; while the [illegible] while selected creased in length 0[illegible] seem that a rod, when [illegible] er or shorter accordi[illegible] surface to volume is [illegible] in this camp certain limit. Subsequ[illegible] of the Stone-both rods became gradu[illegible] nary temperature, the [illegible] Owens amounting to 0.032mm. and [illegible] new ively. When they were re[illegible] they underwent a further dimi[illegible] amounting to 0.015mm. and [illegible] further exposure to the same temp[illegible] duced no alteration in the length. On the other hand, by subjecting the rods to successive rising temperatures, continued shortening was observed. Very hard steel disks suffered similar decrease in the length of their diameter, gradually at ordinary temperature, but more rapidly after being heated.

ORIGIN OF THE SHOT-TOWER.—There was once a mechanic at Bristol, Eng., whose name was Watts. He was by trade a shotmaker. Watts had to take great bars of lead and pound them out into sheets of thickness about equal to the diameter of the shot he desired to make. Then he cut the sheets into little cubes, which he rolled in a revolving barrel until the corners were worn off from the constant friction. The Chicago *Mail* thus relates the rest of the story: Watts, after an evening spent with some jolly companions at the alehouse, went home and turned into bed. He dreamed he was out again with the "boys." They were all trying to find their way home when it began to rain shot. Beautiful globules of lead, polished and shining, fell in a torrent. In the morning, when Watts arose, he remembered the dream, and wondered what shape molten lead would take in falling a distance through the air. At last he carried a ladleful of the hot metal up into the steeple of the Church of St. Mary, of Redcliffe, and dropped it into the moat below. Descending, he took from the bottom of the shallow pool several handfuls of perfect shot, far superior to any he had ever seen. Watts' fortune was made, for he had conceived the idea of the shot-tower, which has ever since been the only means employed in the manufacture of the little missiles so much used in war and sport.

ELECTRICAL POWER DIRECT FROM COAL.—The Chicago *Tribune*, in commenting on the report that Mr. Edison is working on an invention by which he hopes to convert coal into electrical energy without resorting to any intermediate process, says: If he is able to convert into electric energy the power that lies in the carbon and hydrogen of coal, he will have given to man the greatest gift that man can ask of Nature, unless it be the control of the winds and rains. He will have multiplied by ten the present capacity for work of every ton of coal in the world. He will have revolutionized the world of machinery. What the Corliss engine is to the primitive water-wheel of the Egyptian of the days of Pharaoh, that will Edison's device be to the present steam engine. Steam engines and gas engines will all go to the junk-shops, and new plants—what we cannot yet tell—will take their place. Should Edison make such a discovery, all we ask of him is that he will be moderate, and that he will not charge so high a royalty as to heap up for himself a fortune of more than a thousand million dollars during the life of the patent.

PATENTS IN ENGLAND IN 1888.—The total number of applications for patents in England in 1888 were larger than ever before, being 19,070, as compared with 18,051 in 1887, or more than three times as numerous as in any year before the passing of the Patent Act in 1883. That this upward tendency indicates a real amount of industrial progress, it would be impossible to deny, though there is, combined with the rise in numbers, a slight fall in the average value of the inventions, as indicated by the smaller proportion which pass beyond the earliest stage. Very little more than half the applications become completed patents, and the percentage has been gradually, though slowly, declining as the total numbers have increased. Judging from the experience of the previous law, not a quarter of these completed patents will outlast the first period of four years. Under the old system, about 30 per cent were not completed, and of those that were completed about 70 per cent dropped at the end of the first stage (then three years).

AMERICAN MACHINES IN ENGLAND.—Messrs. Charles Churchill & Co. of 21 Cross street, Finsbury, London, have just issued a new catalogue of the American machines and tools imported by them. It is well illustrated, and runs to some 50 pages demy quarto, the cuts being accompanied by ample descriptive matter. The machines and tools include lathes, milling machines, shaping machines, grinding machines, drills, vises, chucks, mortising machines, cutting-off tools, and a host of smaller tools and apparatus, all of the most modern type and from the best American makers.—*English Paper.*

GAS EMANATIONS.—A single plate of perforated zinc about a foot square, suspended over a gas jet, is said to retain the noxious emanations from burning gas, which it is well known destroys the binding of books, tarnishes the gilding and vitiates the atmosphere for breathing.

Bad Meat Can Do.

...read with much inter... the present discussion ... in relation to diseased ... Norfolk gives the following ...unt of what a layman would ... attack: "I received into my ...ile empty, a small morsel of septic ... a short time a sickening, sinking ...ion was experienced, with copious secre... of hot, frothy mucus, swimming in the head, and great nervous prostration. Placed under circumstances which rendered it impossible to use emetics or any other medicaments, I rode for 15 miles in great torture. Procuring a draught of fine domestic wine, I was enabled to complete my ride, reaching home late at night, after a ride of more than 20 miles since eating the poisoned meat. Not having eaten anything since early morning, I ate supper and retired. My night was one of great trouble, oppression and anxiety—frightful dreams tormenting me through all its dreary hours. I arose next morning, weak, sick, tremulous, feeble, and with a frightful vertigo. I ate a light breakfast and hastened to visit some ill patients. I returned about midday, with a sense of sinking which seemed to me to be the prelude to death. I drank a large draught of water and soda, threw up a quantity of nauseating, foaming fluid, and felt as if every support were gone and I could survive but a few moments. Seeing a mixture of salicylic acid and bicarb. soda on the mantel, I called for it and took a dose, repeating it every 15 minutes. I distinctly felt it pervade my whole economy, giving force to the heart, clearing up the brain, throwing off the incubus, and affording the most delightful relief. It soon began to operate on my kidneys, and a very copious flow of urine followed. It was evident the medicine had neutralized the septic agent and caused its rapid discharge by the kidneys. Here was a single morsel of diseased meat, exceedingly minute, but which in 20 hours had so transformed and poisoned all the fluids as to place me in imminent peril."

Many of the most malignant diseases are caused by eating diseased meat.

At Naples, in 1617, over 60,000 persons died from eating the meat of animals that had died of malignant murrain. The same grievous murrain affects our cattle to this day in all tropical and semi-tropical climates.

Dr. Most cites the following cases: A man contracted a malignant fever and died after salting the meat of an ox which had been sick with murrain.

A family died after eating the meat of a hog which had been sick with angina.

In Marburg, Steirmark, several persons died of hydrophobia who had been eating meat from cattle which had been bitten by a mad dog.

To avoid poisoning or parasitic infection from meat, always procure fresh, wholesome meat and thoroughly cook it, to destroy the life of the parasitic embryo.—*The American Lancet*

COFFEE AND ITS EFFECTS.—The great virtue of coffee is that it stimulates and refreshes, these properties being due to caffeine. It also contains gum and sugar, fat, acids, casein and wood fiber. Like tea, it powerfully increases the respiration, but, unlike it, does not affect its depth. By its use the rate of the pulse is increased and the action of the skin diminished. It lessens the amount of blood sent to the organs of the body, distends the veins and contracts the capillaries, thus preventing waste of tissue. It is a mental stimulus of a high order and one that is liable to great abuse. Carried to excess, it produces abnormal wakefulness, indigestion, acidity, heartburn, tremors, debility, irritability of temper, trembling, irregular pulse, a kind of intoxication ending in delirium and great injury to the spinal functions. Unfortunately, there are many coffee-tipplers who depend upon it as a drunkard upon his dram. On the other hand, coffee is a sovereign efficacy in tiding over the nervous system in emergencies. Coffee is also, in its place, an excellent medicine. In typhoid fever its action is frequently prompt and decisive. It is indicated in the early stages before local complications arise. Coffee dispels stupor and lethargy, is an antidote to many kinds of poison, and is valuable in spasmodic asthma, whooping cough, cholera infantum and Asiatic cholera. It is also excellent as a preventive against infectious and epidemic diseases. In districts rife with malaria and fever, the drinking of hot coffee before passing into the open air has enabled persons living in such places to escape contagion.

HUMAN HEART-BEATS.—In the human subject the average rapidity of the cardiac pulsation of an adult male is about 70 beats per minute. These beats are the general rule in young children and women, but there are variations within certain limits in particular persons owing to the peculiarities of organization. It would not necessarily be an abnormal sign to find in some particular individuals the habitual frequency of the heart's action from 60 to 65 or 75 to 80 per minute. As a rule, the heart's action is slower and more powerful in fully developed and muscular organizations, and more rapid and feebler in those of slighter form. The range is from 25 to 45 in the cold-blooded, and 50 upward in the warm-blooded, animals, except in the case of a horse, which has a very slow heart-beat, only 40 strokes a minute. The pulsations of men and all animals differ with the sea-level also. The work of a healthy human heart has been shown to equal the feat of raising five tons four hundred-weight one foot per hour, or 125 tons in 24 hours. The excess of this work under alcohol in varying quantities is often very great. A curious calculation has been made by Dr. Richardson giving the work of the heart in mileage. Presuming that the blood was thrown out of the heart at each pulsation in the proportion of 69 strokes per minute, and at the assumed force of nine feet, the mileage of the blood through the body might be taken at 207 yards per minute, 7 miles per hour, 168 miles per day, 61,320 miles per year, or 5,150 880 miles in a lifetime of 84 years. The number of beats of the heart in the same long life would reach the grand total of 2,369,776,000.—*Medical Journal*.

THE GERMAN ALPHABET.—Their grotesque alphabet is making the Germans a nation of near-sighted people. Defective vision is not only acquired, but it appears to be handed down to offspring. Cohn found over six per cent of elementary pupils in Germany considerably myopic; while in Antwerp Dr. De Mets finds only two per cent slightly affected. Still Bismarck persists in refusing to allow the use of the Roman alphabet.

THE TONGUE.—The following facts about the tongue may interest some people: A white tongue is said to denote febrile disturbance; a brown, moist tongue, indigestion; a brown, dry tongue, depression, blood-poisoning, typhoid fever; a red, moist tongue, inflammatory fever; a red, glazed tongue, general fever, loss of digestion; a tremulous, moist and flabby tongue, feebleness, nervousness.

SPRAYING IN TOOTH-DRAWING.—Drs. Henoque and Fredel, in a communication made to the Biological Society of Paris, state that the extraction of a tooth may be rendered painless by spraying the neighborhood of the external ear with ether. The anæsthesia of the trigeminus so produced extends to the dental nerves, and thus renders the production of the general anæsthesia needless.

A LONG SLEEP.—Mrs. Emma Althores of Attica, N. Y., recently awoke from a long sleep or trance, which continued 35 days. She was very weak and could not speak, but was able to take light nourishment. Her mind was clear.

USEFUL INFORMATION.

Manure From Basic Slag.

The basic slag from the steel works of England is being largely used for manure. A recent English letter says:

Our basic steel-masters are preparing to get more profit than hitherto out of their slag rather than let the clever Germans continue to get the lion's share of such profits. The North-eastern Steel Company is proceeding rapidly with the erection of an extensive grinding plant for grinding its slag for agricultural fertilizing purposes instead of continuing to export it to Germany, there to be reduced to powder and to be reimported as now into the Thames at about 30s. per ton. At present something like 1000 tons of slag a week are being exported to Germany, but home steel-masters hope soon to have a good deal of the trade in their own hands. The Carlton Iron Co., in the north of England, has already erected a grinding plant, and now the Staffordshire Steel & Ingot Iron Co., Wolverhampton, has started a grinding plant. It is very similar to that employed in grinding superphosphates and is of Lancashire make.

The process of pulverizing the slag is divided into three stages: First, the slag is fed into the preparing-mill in its rough state and is reduced to about 3 16 inch, and any pieces of steel larger than this dimension are taken from the mill, generally about once an hour. During this primary reduction a quantity of fine material is produced, and is extracted by Wood's patent separator before the reduced material passes to the second stage in which a magnetic separator extracts the small pieces of steel.

The last stage reduces the slag to such a fineness that it has the appearance of flour, and can be passed through a mesh with 10,000 holes per square inch, a very obvious advantage considering that the value of the slag depends upon its fineness. I fear it will be some time before our methods for making the most out of the slag are as complete and scientific as in Germany, where I need scarcely add that they are not only grinding it, but likewise treat it chemically with hydrochloric acid to obtain phosphate of lime for manurial purposes.

THE CAT AS AN INSPECTOR.—According to the *Hospital*, it was a stroke of genius to find an occupation in life for that lazy though useful household pet, the cat. The happy inspiration came to a gentleman who had reason to suspect that his house drains were defective. He threw the entire establishment open to the inspection of his cat and then poured a strong infusion of valerian into the pipes. The plot succeeded to a marvel. Puss, who is as fond of perfumes as any client of Mr. Rimmel's, soon discovered three leaks, at each of which she established herself in turn to enjoy the pungent odor at her leisure. Thus not only were the householder's suspicions confirmed, but the actual situation of the leaks was revealed as accurately as if they had been indicated by a sanitary inspector.

LARGE TELESCOPES.—In an item in the PRESS recently, mention was made among the nine refracting telescopes exceeding 20 inches in aperture, one at "Buckingham Palace, London, England." Mr. W. B. Murdoch of this city calls our attention to the fact that this is an error, as the instrument referred to belongs to James Buckingham of London, formerly of the Council of the Royal Astronomical Society. Mr. Murdoch says: "Having named this self-educated man of science, I embrace the opportunity of saying that he not only made the telescope at his own expense in pursuit of his favorite study, but it may be added that he did the mechanical work, all but the casting of the glass, with his own hand, at a time when these large glasses were rarer than now. How much that means is known best to those who know the difficulties attending the polishing of large discs. The tube of that telescope is 36 feet long, or 39 with the dew-cap on. It is not only a large instrument, but one of the finest in the world."

THE SOFT BRONZE COLOR OF METALS is obtained by rubbing with a mixture of bloodstone and graphite, applied with a brush. Antique green effects are secured by dipping the metal into a solution of ten parts by weight of salt, ten parts cream of tartar, ten parts of acetate of copper, thirty parts of carbonate of soda, in two hundred parts of vinegar. The satin finish is produced by green vitriol of copperas and subsequent treatment with wax, while old green is obtained by several coats of acid and a final coat of wax, and a grayish green is produced by the use of sal-ammoniac.

A SPEED RECORDER for railway trains is the invention of a Chicago German. An indicator may be placed in a passenger car and the speed of the train at any time is shown upon its face. The connection is made with the locomotive engine by the steam pipes. The cost of the instrument is about $130. One was tried the other day on a train between Chicago and New York. There were brief times when the wheels of the car stopped and did not revolve, and then the indicator dropped quickly to zero, as the instrument is governed by the revolutions of the wheels.

ORIGIN OF THE POUND WEIGHT.—It is said that the old English pound was originally derived from the weight of 7680 grains of wheat, all taken from the middle of the ear and dried. Then came the Troy pound. Henry VIII introduced the avoirdupois pound, containing 7000 grains. At one time the pound weight of silver was really a pound of silver divided into 20 shillings. The word pound has gradually become separated from its original meaning, and is now used in several different senses, as applied to money as well as weights.

PAPER LEATHER MADE TO IMITATE CALFSKIN. In the last 12 months, says the *Revue des Cuirs*, a paper leather to imitate calfskin has made its appearance, and seems likely to play an important part in the manufacture of portfolios and albums. It can be used for a variety of purposes, for toilet articles, bookbinding, etc. Real calf is expensive, but of great durability. This imitation calf is cheap, although it can hardly be expected to wear well.

MONTANA presents the fact that her production of gold, silver, lead and copper last year was worth $40,000,000—an increase of $10,000,000 over 1887—as a point of some value in her claim to be admitted to full fellowship in the Union as a State. Her cattle trade is also of enormous value, and altogether the exported surplus of her productions will probably largely exceed that of several of the older and more populous States.

TO REMOVE STAINS FROM MARBLE.—An equal quantity of fresh spirits of vitriol and lemon juice will remove stains from statuary marble. Put in a bottle and shake up well, wet the spots with the mixture, and in a few minutes rub with a soft linen cloth till they disappear.

THE THISTLE ROOT.—The thistle at the antipodes seems to attain a most vigorous growth. Its root penetrates to a depth of from 12 to 20 feet, and this root, even when cut into small pieces, retains vitality, each piece producing a new plant.

THE miners of Scotland have formed an Order called the "Sons of Labor." This is a better name and not so high-sounding as the "Knights of Labor," the big labor Order of the United States.

TO SOFTEN LEAD.—There is no better way for softening lead than by recasting. If it is pure, it should be soft. Otherwise, use it for other purposes than those which require the pure metal.

RAISINS.—The people of the United States eat more raisins than the people of any other country—44,000,000 pounds per year.

The Acorn and the Oak.

(*Continued from page 12*)

from the subjection of such an acorn to their power, when can such life be said to be created?

Is it when the flower, from which the germ starts, is fructified, or when the acorn, fully developed and incased within its protective armor, drops from the parent tree? Or does creative power patiently wait until by chance the accidents of acorn, heat and moisture all comtine together, and then interpose its creative fiat?

Without being able, perhaps, to answer a great many questions which may and doubtless will arise in attempting to pursue speculations or formulate even approximately clear ideas on these interesting and important subjects, it seems plain that the oak grows from the acorn by virtue of natural laws inherent in the substances of which the oak and the acorn are respectively composed; and that in the uncounted and uncountable successions of generations since the first acorn sprouted and the first oak reared its limbs toward the heavens, there has been no new creation or exercise of creative power of any kind.

It is not proposed at present to enter upon the question of what may be called the original creation of the primeval germs. But if the oak be produced by virtue of forces inherent in matter, it seems to follow that there must have been a primeval germ of some kind or other. If so, whether such germ were brought forth by a divine act of creation or were merely the natural and necessary result of a certain aggregation of matter, however brought about, it must have preceded both the acorn and the oak. If such were the case, the question before mentioned, as to whether the acorn originally came from the oak or the oak from the acorn, does not present any very great difficulty. The answer clearly is, that neither originally came from the other, but that both were evolved *pari passu*, side by side, by gradual development from earlier forms, commencing with the primeval germ.

When the oak dies, as in the space of a comparatively small period of time it does, it turns again to dust and eventually to inorganic dust, substantially similar to the inorganic matter of which, by virtue of its wonderful assimilative powers, it originally built itself up. The leaves which, from season to season, performed their functions and appropriated and assimilated their appointed portions of carbon, just as regularly after their work was over, first turned yellow and then brown, then fell off, rustled for awhile over the ground, drifted into hollows, and in time rotted into mold. The wood of the tree lasts longer; but it, too, eventually must succumb to the same fate. If it be cut into cords and thrown into the oven, the change is more rapid than if it be left to lie in the forest until it returns to its original elements; but in both cases the process is essentially the same. Under any and all circumstances, whether it be by the rapid consumption of fire, or the slower process of parasitical dry-rot, or the long and tiresome disintegration of gradual decay, there is, and in the end there must be, in every case, a disruption and dissipation of the molecules as if they had never been united in a living body.

A New Church Structure.

A very noticeable feature in the growth and prosperity of San Francisco is the character of the buildings erected during the past few years. The residences are improving in style and finish, and the commercial buildings are now largely made of stone of various kinds, with better architectural features than formerly. Among fine buildings completed of late is the new Unitarian church, an engraving of which we give herewith.

The new edifice on the southwest corner of Geary and Franklin streets faces the east. It is a fine structure of a mixed style of architecture inclining to the Romanesque, and as most of our churches are of brick or wood, the one in question is particularly noticeable, being as it is built of stone taken from a quarry on our own peninsula. It has been built at a cost of $60,000 upon a lot 120x137½ feet, for which $31,000 was paid out of the money realized from the lot on Geary street, where the late church stood, and which was bought by a Boston man for $120,000. The new church is truly an ornament to the city, and one we may justly feel proud of. The interior is in the antique style, making a charming harmony with the exterior. The hundred and ten pews are of antique oak and were manufactured in the East. The walls are tinted and the ceiling is an open timber one. The roof is of slate. There is a small parlor in front with a bay-window, and a large parlor back of it. Then comes the Sunday-school room. The three connect by folding-doors which can be thrown open for entertainments. Next to these come the library and two smaller rooms, one for the choir and the other for the sexton. The old pulpit, the font and the railing in front have been utilized. The organ, purchased for $4000, is a magnificent instrument. The three rose windows looking to the north, south and east are worthy of all praise, giving the interior a warm, cheery appearance. The handsome bell is very superior in size and quality and is on the key of F. Its weight is 4000 pounds. It was purchased in Troy, N. Y., for $1200 and donated by John Perry, Jr., who was one of the early promoters of this, the only Unitarian church in the city.

Passing Events.

The collapse of the unfinished 14-story building in Chicago this week will doubtless have the effect of calling attention to the danger of such high structures when built on small ground-space. In the Eastern cities the buildings erected of late have been very high, and no one has yet fixed the limit; but there will be more care exercised in future.

The U. S. Senate Committee on Mines and Mining is now considering the Alien Mineral Land bill, and the question of miners using scrub timber from Government land. Both these questions are of great importance to the mining community.

A very important decision was rendered by the Supreme Court this week relating to mineral and agricultural lands on railroad grant. The decision says that, in the eyes of the Government, all the land embraced in the grant is agricultural, and that this view cannot be changed by any decision of courts as to the character of the lands. It has always been understood that mineral lands were reserved from railroad grants.

The famous Keystone mine in Amador county, opened in 1850, and which for 39 years never failed to pay its regular dividends, is about worked out. A number of men have been paid off and half the mill closed down. The company will continue to sink from the 1500 to the 1700 level and prospect, but they now only have a small ledge on the 1500.

Mineral Lands on Railroad Grants.

A very important decision has just been rendered by the Supreme Court concerning mineral lands on railroad grants. It affects many settlers in California who have secured their homes by the homestead or pre-emption law. It seems to give all the mineral, as well as agricultural lands, to the railroad company in their grant, and still further narrows down the field for prospecting in this State,

The case is the first of the kind to be settled by the Supreme Court. The action was brought by John Gale against S. M. Best et al. to recover possession of certain lands. The lower court gave judgment for the plaintiff, and an appeal was taken from the judgment and an order made denying defendant's motion for a new trial. The land in dispute lies within the limits of the grant of lands by Congress to the California & Oregon Railroad Company. The Central Pacific succeeded the above company, and in 1875 the Government issued a patent to them. The plaintiff took possession and held the land under the Central Pacific Company. In December, 1885, the defendants entered upon the land, located a mining claim, dispossessed the plaintiff and began mining, claiming the right to the possession of the land on the ground that it was mineral land and that all mineral land was reserved in the grant by Congress to the railroad. At the trial that part of the defendant's answer which set up this claim was, on motion of plaintiff, stricken out, and an objection to their offer to prove the land was mineral was sustained. Upon these two points the appeal was taken.

The court's opinion is lengthy and exhaustive, and numerous precedents are cited to sustain it. In the closing paragraphs the following is the language :

Our opinion is that where a patent issues for public land under a law which provides for its distribution as agricultural land—either to a railroad company or to pre-emption of homestead claimants—and there is no reservation in the land except a general one of mineral lands, and no reservation at all in the patent, then the land must be considered as agricultural.

Wyoming Mines.

In conversation this week with a gentleman from Evanston, Wyoming, we learn that the coal-mining interests of the Territory are in a good condition, and likely to be enlarged. There is some talk of opening up a large coal-field on the Oregon Short Line at Twin creek.

The Twin Creek section is on the divide between the Green River and Bear River watersheds. The Oregon Short Line has a tunnel through the hill near there, so there is plenty of opportunity for transportation. There has been more or less litigation for some years, keeping back development, but some parties from New York intend taking hold and working the mines in the coming spring. An extraordinary series of veins is found there, about 30 distinct veins having been discovered. One of these is over 100 feet thick, two or three will run over 30 feet, and a dozen or more show 10 feet in width. The strike is about north and south, and the dip about 25 to 30°. The coal is soft, but compares favorably with that in the same neighborhood. There are very few "bands" in the veins. The coal burns clear, with very little ash. The U. P. R. R. Co. formerly did some mining at this point, but stopped work on account of litigation.

A great deal of coal is being shipped from Rock Springs, some coming to San Francisco. About 800 tons a day go to Butte, M. T., and it is expected when the Twin Creek beds are worked, some of the trade will go to that company. The coal at Almy is not good for shipping. It is too dirty. The Central Pacific Co. has a mine at Almy, and is now supplying the Union Pacific with some coal from there.

There are some placer mines in the central portion of Wyoming, and recently there are reports of the discovery of silver ores.

MANUAL LABOR on the mines in Cauca valley, U. S. of Colombia, costs from 15 to 40 cents per day. There are many rivers, so there is plenty of water for gravel mining.

A NEW kind of water-jacket furnace is being tried by the Boston & Montana Co. It has one continuous air-chamber to maintain the blast.

Scrub Timber on Public Lands.

It will be remembered that the Eureka Consolidated mine of Eureka and other companies have been sued by the United States for cutting timber on public lands, and as a result these companies have stopped mining work. In the examination of Commissioner Stockslager before the Senate Committee on Mines and Mining several days ago, in regard to the suits recommended by him to be prosecuted against certain mining companies in Eastern Nevada for cutting scrubby timber from the public lands for mining purposes, the Commissioner could not answer the question as to whether the special agent sent to investigate the matter had given the defendants an opportunity to state their side of the case. He also refused to produce certain correspondence from Henry Rives of Eureka, assistant counsel for the Government, on the ground that it was private and confidential.

Senator Stewart received a letter from the Commissioner this week, in which he states that the special agent did not give the mining companies an opportunity to state their case, because he was advised not to do so by Rives, notwithstanding it has always been the rule of the Department to give the defendants such a hearing. Senator Stewart will have Commissioner Stockslager subpenaed and will compel him, if possible, to produce the correspondence of Hayden, the United States District Attorney of Nevada, and also of Rives, upon which his proceedings were based. The action of the Department in bringing these suits against the mining companies is looked upon with great disfavor by the mining community all over the coast.

Aliens and Mineral Lands.

The people in the Territories are anxious to have Congress come to some decision as to the sale of mines to aliens. It will be remembered that when the Alien Act was passed, preventing aliens from holding lands in the Territories, it was found that it prevented people selling mining property to aliens also. A bill was then introduced changing the law in this respect, so that aliens could hold mining properties in the Territories. A committee was appointed by the U. S. Senate to investigate the subject of ownership of mines by aliens in the Territories and recently finished this investigation. But so far no conclusion has been reached. On Monday, in the U. S. Senate, a memorial from the Legislature of Montana was presented, urging action on the bill now pending relative to the sale of mineral lands to aliens. The memorial states that mining is the chief interest in the Territory and there are unlimited fields for the investment of capital, and to that end free, untrammeled introduction of foreign capital should be permitted for the development of the mining industry.

The Late J. C. Flood.

J. C. Flood, the California mining millionaire, and well known as one of the Bonanza firm, died at Heidelberg on Thursday. Mr. Flood laid the foundation of his great fortune during the bonanza days of the California and Virginia mines on the Comstock. In the early days of this State he occupied a humble position, but rose through his mining ventures to be one among the very wealthy men of the world. His residence on California-Street hill in this city is the finest building on the Pacific Coast, and he had also in San Matéo an elegant country-seat.

Mr. Flood's name is everywhere known among mining-men from his connection with the Comstock mines. Of late years he has paid little attention to this branch of business, confining himself to duties connected with the Nevada bank. Mr. Flood will be sadly missed by the poor of this city, for he was one of the most generous of men. His gifts to public charities were about $25,000 a year, and including these, he annually gave away in charity about $100,000. No other of the California millionaires was as liberal as he in this respect. He was a man of domestic habits, devoted to his family, and had a wide circle of friends. He had been for some time in Europe, where he went in the hope of improving in health.

THE *Lower Californian* says there is sulphur enough on the peninsula to supply the world.

Iron and Steel Direct From Ore.

F. L. Garrison of Philadelphia some time since visited the iron works of Count Stroganoff at Dobransky, Perm, Russia. He also saw the Wartsila iron works in the eastern part of Finland, near Lake Ladoga, and described the furnaces in use at the latter place, which have double walls of soft iron plate, and are very effective. Favorable results are accomplished by the peculiar circulation of the blast through the hollow walls of the furnace and by the insertion of the tuyeres into the hearth itself.

The walls of the Wartsila furnace (see engraving) are of wrought-iron plate, the whole being enveloped by a second wall or shell, extending from the hearth to the throat, thus forming a series of zones, divided by spiral partitions, making a continuous spiral flue, coiled, as it were, around the furnace. The blast, passing through this, is heated under ordinary circumstances from 150°–250° C. (302°–482° F.), though sometimes running up much higher. By means of a system of dampers t and pipes r, r', r'', r''', r'''', the circulation of the blast through these chambers or flues can be regulated with the greatest ease. If the blast is too hot, the upper and middle chambers are shut off; if, on the contrary, it is too cold, the upper chambers, which are frequently not used at all, are opened. This contrivance, together with the movable hearth, gives a most effectual control over the operation of the furnace. To check loss of heat by radiation, the outer shell is coated on the outside with a four-inch layer of fire-clay.

The other most important improvement made in the Wartsila furnace was the insertion of the four tuyeres directly into the movable hearth. There are four tuyere holes c in each of the two opposite sides of the hearth, the lower being three inches and the upper six inches from the bottom. When a fresh hearth has been inserted and a new loupe is beginning to form, the tuyeres are inserted in the lower holes; as the loupe increases in size their inclination is lessened, the object being that the blast should just impinge upon the surface of the loupe. When the loupe has grown up nearly to the level of the lower tuyere holes the tuyeres are removed, placed in the upper holes, and the lower ones stopped with clay. The same operation is then repeated until the loupe reaches the level of the upper holes, when the tuyeres are taken out and the hearth is removed and replaced with a fresh one.

Thus the operation is practically continuous, the blast being stopped for about five minutes while the hearth is being replaced. The hearth stands upon a vertically moving platform which can be raised and lowered a few inches, thus permitting a tight joint being made between the furnace proper and the hearth, the crack of about an inch between the two being first carefully luted with clay before the hearth and platform are raised. The slag is tapped off into a car running under the hearth by a series of four holes (l), one above the other. The hearth containing a fresh loupe, after being replaced with another, is revolved on the axis b, over the cast-iron arms, a.

COLORED MINERS.—After three years' experiment in working white miners in the Northern Pacific Coal Company's mines at Roslyn, Kittitas county, Washington Territory, during which there have been four strikes, the company shut down the mines two months ago and have been collecting colored miners in Illinois and Indiana since that time to take the places of the strikers. A train arrived at Roslyn last week with 400 colored miners and their families. It is the intention of the company to replace all the white men with negroes. The white strikers number 450 men, and are of 15 different nationalities, many of them owning their houses in Roslyn.

MARIPOSA GRANT.—Additional men are working in Bear valley on the Mariposa Grant cutting a ditch and preparing pipe for the air-compressor to work the Burleigh drills in the Pinetree and Josephine mines. The owners are trying to sell the mines on the grant to English capitalists.

SUPT. MCCURDY of the Paradise Valley Mining Co., Nev., requests the *Silver State* to say that no more miners can get work at the Paradise mine; in fact there are more men in Spring City now than are needed.

Precipitating Vats.

In last week's PRESS we gave a sketch of Ottokar Hoffmann's complete trough-lixiviation plant from a paper read by him before the American Institute of Mining Engineers. On this page are shown figures which illustrate his precipitating vats used in the process, and also a very convenient arrangement of filters for the precipitate. The tanks are provided with a machine-stirrer of the construction indicated in the drawings.

In these Fig. 1 is a vertical section of Fig. 3. Fig. 2 is a horizontal view of Fig. 3. Fig. 3 is a precipitating vat with machine-stirrers and filters for Hoffmann's trough lixiviation. Fig. 4 is a horizontal view of the filter frame; and Fig. 5 is a section of Fig. 4.

The stirrer *s* (Figs. 1 and 2) has to make about 30 revolutions per minute if the diameter of the tank is not more than 8 or 9 feet. It is set in motion or stopped by working the friction-clutch *f* (Fig. 1). The wings *g* (Fig. 2), which reach near to the bottom, are about three inches wide, and are kept in position by triangular pieces of boards. They break the violent current around the periphery and throw the solution toward the center, thus causing a strong whirling motion. In Figs. 2 and 3 *a* is the discharge pipe for the clear solution, and *b* for the precipitate. Pipe *d* passes in front of all the precipitating-tanks, and conveys the calcium or sodium-sulphide solution from the reservoir to the tanks. The branch pipe *c* reaches above the rim of the tank, and ends in a rubber hose, which is provided with a clamp. In precipitating, the stream of calcium sulphide can be regulated, and the operator, by observing the color produced by the precipitant in the moving solution, can, after some practice, finish this operation in a very short time, and much more easily than by using buckets.

The machine-stirrer does also good work in discharging the precipitate. After the clear solution has been decanted within a few inches of the precipitate, the stirrer is set in motion, and the discharge pipe *b* opened. The stirrer agitates the precipitate until nearly all is discharged into the filters or into the vat from which the filter press is supplied. Thus the cleaning of a tank can be done in a very short time.

Where the filter press is not used, a filter arrangement, as shown in Figs. 3, 4, and 5, will be found very convenient. Two rows of filters are so arranged that they are in communication with each other by depressions cut into the divides of the frame. By allowing the precipitate to flow into one filter, all the adjoining filters will gradually be filled one after the other, without requiring the attention of the operator.

The filters are shallow and the precipitate will thus be spread in a comparatively thin layer over a large filtering surface. Under each row of filters is placed a trough *n* which receives the filtrate and conveys it to the pump-tanks *P* below the floor. These filtrate frames are placed in front of the precipitating-tanks, and one can be made to contain quite a number of filters. Owing to the shallowness of the filters and the large filtering surface, the solution will draw off fast, and in five or six hours the precipitate will be stiff enough to be charged with a hand shovel into the furnace.

PRECIPITATING VAT WITH MACHINE STIRRER AND FILTERS.

The Electric Power at Big Bend.

Some time since an electric transmission plant was put up at the Big Bend Tunnel Co.'s property, Butte county, in this State, for furnishing power for pumping and removing boulders when the bed of the river should be laid bare by the water being turned through the tunnel. Not very long after it was put to work the electric plant was taken out, and the supposition was that it was unsuccessful. This, however, was not the case. As publication of the error did the Sprague Electric Railway & Motor Co. some injustice, we publish the following extract from a letter to the California agent of the company, written by R. V. Pierce, president of the Big Bend Tunnel & Mining Co. He says:

"The difficulties in operating your motors at Big Bend were entirely outside the electric plant. No proper government had been provided for the water-wheels with which they were driven, and as the work was such that the loads were very suddenly thrown off, and in doing the hoisting of boulders, gravel, etc., it permitted the potential of the current to run up to such a degree as to burn out some of the armatures. This danger to the armatures was overcome by the better regulation of the speed of the water-wheels, obtained through the application to them of deflecting nozzles, but would have been more completely controlled had we been able to stop the work and apply proper governors to the wheels. The fact that the plant had been taken out was not due to any fault in the electric machinery whatever, but simply for the reason that, on account of vast quantities of boulders developed by our mining excavations, we found we could not work the ground profitably.

"It is only just to the Sprague Company that I should make these statements in refutation to the false statements circulated with respect to their machinery. A similar statement has been sent to the Sprague Company at New York, and which you are at liberty to use as you may think proper."

WAVE POWER.—The Wave Power Co. of San Francisco has petitioned the supervisors for the use of a portion of the western part of the City cemetery, not to exceed 70,000 square feet, near Point Lobos, for a salt-water reservoir, to be used in further demonstrating the utility of their wave-power motors. The company ask also that the rent of the premises be made nominal, alleging as a reason therefor that the carrying out of the enterprise will add greatly to the prosperity and health of the city.

THE past two years the South Yuba Canal Company has been running a bedrock tunnel to get into the old blue-lead cement gravel channel that was thought to run through their ground. They have, however, struck gravel which prospects well. This is a good thing for the old camp of You Bet.

JOHN CLAFFIN, a New York member of the Pioche Mining Company, has sent to the miners of the camp as the nucleus of a library 500 volumes of carefully selected and valuable books.

EXTENSIVE GOLD MINE FOR SALE.

To be sold at public auction by the undersigned, at the Merchants' Exchange, in the City of Halifax, on Thursday the Fourteenth day of March next, at twelve o'clock noon, that extensive, valuable and well-equipped GOLD MINE known as the Dufferin GOLD MINE, situate on the Atlantic coast, about ninety miles east of said city. Daily mail from Halifax. Telegraph office at Salmon river, four miles from the works. Salmon river harbor never freezes, and is safe and easy of access. The mine embraces 342 areas, each 150x250 feet, all in one block. The entire area measures fifteen hundred feet in width across, and eight thousand five hundred and fifty feet along the lodes. The leases have nearly fourteen years to run, and can at any time be renewed for a period of twenty-one years, upon payment of two dollars per area. Within this area is a belt of veins dipping on each side of an anticlinal. They have been found by tests made on the surface to extend upwards of 4,000 feet. The ore has been partially removed to a depth of 200 feet over a distance of about 700 feet, and to a depth averaging about 70 feet over an additional 1,000 feet in length or thereabouts. The veins are of various width, the largest averaging about ten feet of solid quartz.

This mine was discovered in the Autumn of 1880, but was not worked to any extent until the Autumn of 1881. It has yielded up to the end of November, 31,012 ounces of gold from 64,503 tons of quartz, according to the sworn returns made to the Mines Office. The gold can be produced at a cost which will leave a very handsome margin of profit.

The mine is operated by machinery worked by water power, the power being transmitted by a line of wire rope running from the water wheel to the mine—a distance of about 4,750 feet—and lying parallel to the outcrop of said veins, at a distance therefrom of about fifty feet. The Salmon river crosses the property twice. It supplies the hoisting and pumping power, and the same water is afterwards used to drive the crusher. The latter has thirty-eight stamps, and there is ample water power to operate three times that number. Sixty stamps can be operated with present machinery. Of the 120 horse-power existing for pumping and hoisting only about twenty-five is used. There are about 700 acres of well timbered and well watered land owned with the mine. This partly covers the areas, and where it does not immediately adjoins them. It is also provided with a steam plant to operate hoisting gear and pumps in case of accident to the transmission power, a sawmill, sufficient for the requirements of the property, a tramway from the mine to the crusher for carrying quartz, and stables, offices, and boarding-houses, sufficient to accommodate a large number of employees.

The mine is owned and has been operated by a partnership, and owing to the death of one of the principal owners it has to be sold to enable his estate to be settled. A good title will be given.

Terms, ten per cent cash, balance within thirty days from day of sale. The deposit to be forfeited in case the purchaser fails to complete the purchase within that time. Further particulars can be had on reference to N. H. MEAGHER, Q. C., Bedford Row, Halifax, or to JAMES DUGGAN & SONS, Auctioneers, Bedford Row.

Patent Pop Safety Valves

THE LATEST AND BEST FOR

Locomotive, Stationary & Marine Boilers.

FIVE SIZES AND DIFFERENT KINDS.

Send for illustrated and descriptive circular.

Address, **Standard Valve Works,**
Box 398. Oakland, Cal.

Manufacturers of

Sheet Iron and Steel Pipe

ALL SIZES.

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

FOR SALE.

The Empire Foundry and Machine Shop in the city of Marysville, now and for many years doing a remunerative business, is offered for sale at less than half its value. Everything as it stands—stock, machines, patterns, real estate, etc., etc., will be sold on easy terms. A first-rate opportunity for establishing an agricultural implement manufactory as an adjunct. This is the only foundry and machine shop in the neighborhood.

For further particulars address

R. HOSKIN, Marysville.

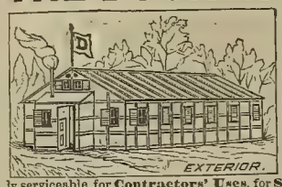
FOR SALE.

One 10x13 inch Clayton Belt Air Compressor.
Three 3-inch Sergeant Drills.
Three 5-ft. Double Screw Drifting Columns with Arms.
One 4-ft. Single Screw Stoping Bar.
One Set Sharpening Tools.
About 1500 pounds Drill Steel.
One Tustin Pulverizer, with new wearing parts, such as Rolls, Grates, etc.

The above are in first-class condition and will be sold cheap. For price apply to the

PAYMASTER MINING CO.,
Yuma, Arizona Territory.

THE DUCKER PORTABLE HOUSES



Combine all the comforts and advantages of a permanent building with the qualities of **Simplicity, Stability, Lightness, Ease of Transportation, Quickness of Putting Up and Taking Down, Ventilation, Heating,** and **Facility for Cleansing.** Equally serviceable for **Contractors' Uses,** for **Sheep** and **Cattle Ranches, Mining Camps** and for **Surveyors** and **Prospectors, Hospitals, Seaside** and **Summer Resorts,** and in all localities where material and skilled labor are scarce, and where it is sometimes desirable to change location. These Buildings can be especially constructed for **Hunting** and **Fishing Camps, Billiard Rooms, Photographers' Studios** and **Lawn Pavilions.** They are built in sections and are put up without the use of screws, nails or any external appliances whatever. Two men can put up the building on ordinary ground in 2 hours' time with out skilled labor. Price, **$250** to **$750. Thoroughly reliable and influential business men only, may communicate with this Company relative to acting as its representative.**

Address DUCKER PORTABLE HOUSE COMPANY, 32 Nassau St., New York.

WE ARE MANUFACTURERS OF THE

CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

SAN FRANCISCO TOOL CO.,

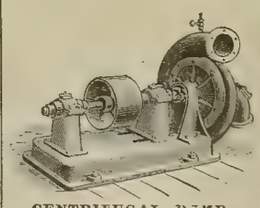
MANUFACTURERS OF

IRRIGATING PUMPS

—AND—

MACHINERY

OF ALL KINDS.



CENTRIFUGAL PUMP.

Send for Catalogues.

WORKS:

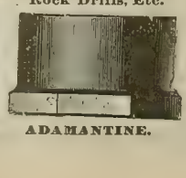
FIRST and STEVENSON STS., S. F.

SOLE AGENT FOR

Adamantine Shoes, Dies and CRUSHER PLATES,

—AND—

Chrome Cast Steel for Rock Drills, Etc.



ADAMANTINE.

H. D. MORRIS,

220 Fremont St., San Francisco,

MANUFACTURERS' and PURCHASING AGENT.

Special attention given to purchase of

MINE and MILL SUPPLIES.

ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.

H. D. MORRIS.

Educational.

School of Practical, Civil, Mechanical and MINING ENGINEERING,

Surveying, Architecture, Drawing and Assaying,

723 MARKET STREET,

The History Building, SAN FRANCISCO, CAL.

A. VAN DER NAILLEN, President.

Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full course of assaying, $50.

Send for circular.

The Evans School

OF

PRACTICAL ASSAYING,

Rooms 6 & 7, First Floor Sherman B'g. } 606 Montgomery St., San Francisco,

Also, Evening Classes, 7 to 10 o'clock.

JOHN T. EVANS, M. A., Principal.

MISSES DEVLIN,

Stenographers and Typewriter Copyists,

Room 7, No. 240 Montgomery St.,

S. E. corner Pine, - - San Francisco.

GO TO THE OLDEST AND THE BEST

1868. **PACIFIC Business College, 320 POST ST.** SAN FRANCISCO. 1888.

LIFE SCHOLARSHIPS, $75.

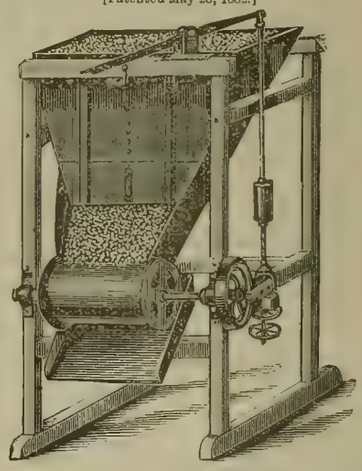
NO VACATIONS. DAY AND EVENING SESSIONS.

Ladies admitted into all Departments.

Address: T. A. ROBINSON, M. A., President.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

827 First Street. San Francisco, Cal.

New Almaden Quicksilver.

J. B. RANDOL,

Room 22, 320 Sansome St.,

San Francisco.

WINANS'

ANTI-INCRUSTATION POWDER

Or Boiler Compound

For Removing or Preventing Scale, Corrosion and Pitting in Steam Boilers. Send for references.

Also PEERLESS RUBBER M'F'G CO. Plumbago Sheet, and Piston and Valve Rod Packing, to be had only of

J. C WINANS, 220 Fremont St., S. F., Cal.

F. H. HAUSMAN,

Gold Mining Properties Bought, Sold and Developed.

Propositions from principals only entertained.

SAFE DEPOSIT BUILDING, ROOM No. 2

THE RUSSELL PROCESS COMP'Y.

C. A. STETEFELDT, President.

NEW YORK OFFICE, 18 BROADWAY

Room 709.

QUICKSILVER

For Sale in Lots to Suit by

PARROTT & CO.,

306 California St., San Francisco, Cal.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING FEB. 12, 1889.

397,580.—HANDLE FOR CROSSCUT SAWS — M. Bennett, Eureka, Cal.

397,581. — ORE-WASHER — Henry G. Blasdel, S. F.

397,691.—FRUIT-PITTER — Briggs & Cavallaro, San Jose, Cal.

397,584. — TRACK-CLEARER — G. W. Cook, Mountain View, Cal.

397,542.—ORE-SEPARATOR—E. L. Giroux, Albina, Ogn.

397,551.—HAY OR GRAIN UNLOADER—Wm. G. Hunter, Traver, Cal.

397,753.—GOVERNOR FOR GAS ENGINES—D. S. Regan, S. F.

397,604.—BRICK MACHINE—J. Morhard, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HAY OR GRAIN UNLOADER.—William G. Hunter, Traver, Tulare Co. No. 397,551. Dated Feb. 12, 1889. This invention relates to that class of unloading devices in which the hay or grain is contained within a net placed in the bed of the wagon, and is operated by means of ropes which roll it and its contents out of the wagon-bed and up on the top of the stack. The patent covers certain constructions and combinations of devices. The object is to simplify the unloading process by avoiding the employment of the usual complicated system of ropes and the inconvenience of their rearrangement after each operation, and to provide an ordinary header-wagon with a simple and readily applicable unloading mechanism.

ORE-WASHER. — Henry G. Blasdel, S. F. No. 397,581. Dated Feb. 12, 1889. This invention consists in an endless traveling belt having its working surface formed of corrugated or riffled portions alternating with plain or smooth portions, providing a belt capable of doing more and better work than the ordinary smooth-surfaced belts, or a belt completely corrugated or riffled. It is mounted at an inclination and the ore-pulp and water are fed upon its surface, whereby the lighter and worthless particles of the ore are washed down the incline, while the heavier and precious particles—such as sulphurets and free gold—are carried up by the belt, clinging to its surface, and are washed off in a tank below.

TRACK-CLEARER. — George William Cook, Mountain View, Santa Clara Co. No. 397,584. Dated Feb. 12, 1889. This invention relates to the class of swathers, the object of which is to prevent the cut grain or grass from falling over on to the standing grain or grass and to direct it properly into the swath or path of the sickle, thus keeping a clear track. The object of the invention is to provide a simple, practical and easily adjusted swather adapted to be fitted o the shoe of any mower.

FRUIT-PITTER.—John G. Briggs and Frank Cavallaro, San Jose, Cal. No. 397,691. Dated Feb. 12, 1889. This invention consists of an endless belt formed of transverse slats united together by links, so as to be driven around drums at each end of a horizontal table. These slats have cup-shaped sockets, in which the fruit is received, with holes in the bottom of the sockets for the escape of the pits and slots through which vertically reciprocating knives pass, so as to cut the fruit around the stone, and in combination with this of a punch by which the stone is forced out. The flesh of the fruit is discharged from the end of the machine into a receptacle for the purpose.

COIN-CONTROLLED LIFTING MACHINE.—Jos. G. Kearney, S. F. No. 397,295. Dated Feb. 5, 1889. This invention relates to the class of machines for testing the lifting powers of the operator, in which the lifting force is directed against or upon the spring, the compression of which is indicated through suitable mechanism upon a dial or register. In this machine when the nickel coin is dropped into the slot, an electric current is completed and frees the pull-rod so the amount lifted can be registered. After this is done, the coin drops into a receptacle, and the pull-rod cannot be again lifted until the electric circuit is again made by means of another coin.

MINERS at Castle camp, Montana, are very angry because the Cumberland Co. does not pay their wages. The sale of the bullion took place at a time when there were $6000 worth of labor liens on it. The attachments of the other creditors also covered this bullion. When the sale was concluded, $7400 being realized, this money was turned over to the merchant creditors and none paid to the miners. Naturally the men were furious. The mine has closed down.

Legislative.
